WITNESSES EXAMINED.

Name.	Description.	Page.
1. Kay, James, 24th day - - -	Chairman of the Blackburn and District Farmers' Association and Chairman of the Federation of Lancashire Farmers' Associations.	1
2. Barlow, James, 24th day - -	Vice-Chairman of the Federation of Lancashire Farmers' Associations.	1
3. Turnor, Edmund, 25th day - -	Landowner in Lincolnshire - - - -	16
4. Bomford, Henry Butler, 25th day -	Tenant-farmer in Warwickshire - - - -	25
5. Punchard, Frederick, 26th day -	Agent for the Underley Estate, Westmoreland - -	31
6. Broughton, John William, 26th day	Land Agent and surveyor in the Skipton District of Yorkshire.	43
7. Smith, Charles William, 27th and 36th days.	Late partner with Messrs. Whitaker, Whitehead, & Co., general brokers, Liverpool.	50 & 201
8. Goldney, Sir Gabriel, 28th day -	Landowner in Wiltshire - - - - -	62
9. Read, Clare Sewell, 28th and 29th days.	Tenant-farmer in Norfolk; representative of the Farmers' Club and the Norfolk Chamber of Agriculture.	69
10. Simpson, William Thomas, 29th day	Agricultural auctioneer and valuer in the eastern counties	94
11. Lopes, The Right Hon. Sir Massey, 30th day.	Landowner in the south of Devonshire - - -	102
12. Rowlandson, Samuel, 30th day -	Tenant-farmer near Darlington - - - -	112
13. Pell, Albert, 31st day - - -	Late Assistant Commissioner to the Duke of Richmond's Commission.	120
14. Giffen, Robert, C.B., LL.D., 32nd and 33rd days.	Comptroller-General of Commercial, Labour, and Statistical Department of the Board of Trade.	138
15. Everett, Robert Lacey, 34th and 35th days.	M.P. for the Woodbridge Division of Suffolk - -	168
16. Druce, Samuel B. L., 36th and 37th days.	Conveyancer and chancery barrister; secretary to the Farmers' Club and late Assistant Commissioner to the Duke of Richmond's Commission.	219
17. Lipscomb, William, 38th day -	Agent for the Savile Estates, Yorkshire; member of the Technical Instruction Committee of the County Council of Yorkshire and of the Agricultural Committee of the Yorkshire College; chairman of the late Tenant Right Committee of the Central Chamber of Agriculture.	238
18. Sparkes, Rev. A. L., M.A., B.Sc., 39th day.	Representative of the Leicestershire Farmers' Union -	254
19. Sheldon, Professor, J.P., 40th day -	Yeoman-farmer and landowner - - - -	269
20. Cooke, George, 41st day - -	Tenant-farmer, Clayley Hall, Chester - - -	286
21. Wolff, Henry William, 41st day -	Member of the Agricultural Banks Association - -	293
22. Richmond and Gordon, K.G., His Grace the Duke of, 42nd day.	- - - - - - - - -	303
23. Ferguson, W. S., 42nd day - -	Tenant-farmer in Perthshire and proprietor of chemical manure works.	310
24. Cotton, General Sir Arthur, 43rd day.	Late Royal Engineers - - - - -	324
25. Clarke, William H., 43rd day -	Land Agent, Cambridgeshire - - - -	326
26. Foxwell, Professor H. S., 44th and 45th and 49th days.	Fellow of St. John's College, Cambridge; Professor of Political Economy in University College, London, and Examiner in Political Economy to the University of London and the Institute of Bankers.	331 & 425
27. Hutcheson, Andrew, 46th day -	Tenant-farmer, Perthshire, and Vice-Chairman of the Perth County Council.	368
28. Ralston, Andrew, 46th day -	Agent to the Earl of Strathmore - - -	381

o 82050. Wt. 11544.

Name.	Description.	Page.
29. Edwards, John, 47th day - -	Tenant-farmer near Crewe - - - -	388
30. Long, Professor, 47th and 48th days	Tenant-farmer in Hampshire and Hertfordshire; Chairman of the Education Committee of the British Dairy Farmers' Association; Chairman of the Committee of the South Hants Farmers' Union; formerly Professor of Dairy Farming at the Royal Agricultural College.	395
31. Parton, Thomas, 48th day - -	Tenant-farmer, Weston Hall, near Crewe - -	415
32. Bell, William, 48th and 49th days	Tenant-farmer in Forfarshire - - - -	420
33. Mercer, Thomas, 50th day - -	Tenant-farmer near Liverpool - - - -	451
34. Bear, William, 50th day - -	Late Assistant Commissioner to the Labour Commission -	455
35. Scott, Henry Hall, 51st day -	Tenant-farmer; representative of the Newcastle Farmers' Club; Alderman, and Chairman of the Roads and Bridges Committee of the County Council of Northumberland; Chairman of the Blackwell Colliery Company; Chairman of the Bolsover Colliery Company; Guardian of the Poor of Rothbury, and Chairman of the Whittingham Highway Board.	474
36. Muirhead, George, 52nd day -	Agent to the Earl of Aberdeen in Aberdeenshire -	489
37. Hoare, Charles, 52nd day - -	Banker, and owner and occupier of land in Kent -	500
38. Acworth, William, 53rd day -	Barrister-at-law, practising before Parliamentary Committees.	506
39. Lousley, Jethro, 53rd day -	Tenant-farmer near Newbury. Representative of the Berks and Oxon Chamber of Agriculture, Chairman of the Wantage Board of Guardians, and Alderman of the Berkshire County Council.	521
40. Wilkinson, Joseph, 54th day -	Tenant-farmer; representative of the Newcastle Farmers' Club.	526
41. Dewar, Charles, 54th day - -	Tenant-farmer in Norfolk - - - - -	538
42. Farquharson, Henry R., 55th day -	M.P, for West Dorset - - - - -	544
43. Forster, John, 55th day - -	Tenant-farmer in Northumberland - - -	550
44. Atkinson, Edward, 56th and 57th days.	President of the Boston Manufacturers' Mutual Fire Insurance Company.	559

MINUTES OF EVIDENCE

TAKEN BEFORE THE

ROYAL COMMISSION

ON

AGRICULTURE.

At 23, Great George Street, Westminster, S.W.

Twenty-fourth Day.

Thursday, 29th March 1894.

PRESENT:

The Right Hon. GEORGE JOHN SHAW-LEFEVRE, M.P., in the Chair.

Captain Owen Thomas.
Cornelius Neale Dalton, Esq., C.B.
Robert Lacey Everett, Esq., M.P.
George Lambert, Esq., M.P.
Charles Whitehead, Esq., F.L.S.

Herbert Lyon, Esq., *Secretary.*
R. F. Crawford, Esq., *Assistant Secretary.*

Mr. James Kay and Mr. James Barlow called and examined.

Mr. J. Kay and Mr. J. Barlow. 29 Mar. 1894.

13,943. (*Chairman to Mr. Kay.*) You are the chairman of the Blackburn and District Farmers' Association, embracing Darwen, Church, Oswaldtwistle, Accrington, Mellor Samlesbury, &c., are you not?—Yes.

13,944. That association, together with several others, decided a few years ago to form a federation of the Lancashire Farmers' Associations?—Yes.

13,945. And you were appointed its first chairman and have since continued in that position?—Yes.

13,946. Mr. Kay Shuttleworth was vice-president of the federation?—Yes.

13,947. On his resignation Mr. Barlow, who is with you to-day, was elected in his place?—That is so.

13,948. Mr. Barlow is chairman of the Rossendale Branch, I presume?—Yes.

Lancashire Farmers' Association.

13,949. The Lancashire Federation of Farmers' Associations embraces some 700 members?—That is so.

13,950. It is entirely distinct from Mr. Smith's Federation of Tenant Farmers?—It is quite distinct.

13,951. Were they originally a part of the same association?—No, it is not quite correct to say that Blackburn was originally a portion of the local association at Preston. If I might put it in my own way I may lead up to our present position. The Local Association of Preston, of which Mr. Rimmer was one of the most active members, was exactly on a par with our association at Blackburn, and Mr. Barlow at Rossendale and Fylde, and various other places. This is what I might call the Tenants' Association in Lancashire from its commencement.

13,952. When was that?—In the beginning of 1892. The first chairman at Preston was Mr. Hothersall, auctioneer and farmer; Mr. Gillespie succeeded him, and it was during Mr. Gillespie's chairmanship of the Preston Local Association that a suggestion was made by him that these various associations should form into one federation for Lancashire, and the Preston Local Body endorsed that opinion and appointed a committee to draw up the heading and the rules of the suggested federation. Fortunately I have been able to find amongst my own papers the exact suggestions which are here, and which are headed "Rules of the Lancashire Federation of Farmers' Associations." This was to be submitted to a meeting of the various Farmers' Associations at Preston; Mr. Gillespie was in the chair. We found that of the four or five associations which were represented there, including Blackburn, Rossendale, Poulton-le-Fylde, and Bury, all were agreed to accept the title of this federation except the vice-chairman of the Preston Association itself, and that was Mr. Rimmer; he objected to the absence of the word "Tenant" between the words "Lancashire" and "Federation."

Mr. J. Kay and Mr. J. Barlow. 29 Mar. 1894.

13,953. I do not think that we need go generally into these differences, but we may take it shortly that you were unable to come to an agreement?—That is so, and the word "Tenant" was the ground upon which we split. We all agreed and we felt, I must say, that it was a little act of discourtesy, after leaving the whole thing to Preston to draw up the suggested rules, and when all were unanimous to accept them, for the vice-chairman of the Preston Association itself to be the only one to object to them, and the consequence of this was that we decided that day to go on with our federation, and Preston was the only one which remained outside it.

13,954. Did the Preston Association eventually develope into the Tenants' Federation of which Mr. Smith has been the exponent before us?—I think I ought to say that in the meantime the Preston Association

Mr. J. Kay and Mr. J. Barlow.

29 Mar. 1894.

had called itself the Lancashire Tenant Farmers' Association, but some people, including Mr. Smith, were opposed to that, they thought that they had no right to take such a title because it was a purely local body, and it was distinctly proved that if we agreed upon this federation in place of the Preston Farmers' Association, that if this federation went on, that Preston was to revert back to the original title of "The Preston and District Farmers' Association." But that federation failing, Mr. Gillespie, the chairman, and Mr. Rimmer, the vice-chairman, quarrelled at that meeting and the result was that Mr. Gillespie, who was past chairman, declined to act further as the chairman and he was acting temporarily as the chairman of the associations which were trying to federate, and that meeting was adjourned until later on in the same day, and the federation which we represent was formed that day and Mr. Gillespie was our honorary secretary, and he has remained so ever since.

13,955. Did the Preston Association develope into the Farmers' Federation?—No. It calls itself the Lancashire Tenant Farmers' Association still. I believe Mr. Smith did not agree with what they did, and he has since formed the federation of which Mr. Rimmer is one of the leading spirits, and Mr. Rimmer is now the chairman of the Lancashire Tenant Farmers' Association which I prefer to call the Preston Farmers' Association for that is what it really is.

13,956. Mr. Smith formed his association independently of this?—Yes, and it has led to a great deal of confusion. The two titles of the Lancashire Tenant Farmers' Association and the Lancashire Federation of Farmers' Associations (which we represent) we retaining the very suggestion which came from them and which was decided upon in April 1892.

13,957. Your association numbers some 700 members you say?—Rather over that number.

13,958. You have views distinct from the association represented by Mr. Smith, I understand?—Yes.

13,959. What are the points of difference?—We do not believe that it is absolutely necessary for any farmers' organisation to limit itself strictly to the word "tenant."

13,960. But that is only a matter of form. I want you to give us the substance of your differences now?—Mr. Smith's federation, which is called the Farmers' Federation, is, I think, without any limit to its locality, I may say that the principal difference between us is this: that they advocate what is generally called and known as the three F's; we, on the other hand, do not approve of that at all; we go in for either an absolutely improved Agricultural Holdings Act, or what we prefer, a Tenant Rights Bill.

The three F's.

13,961. Has the question involved in the three F's been discussed by your association?—Frequently.

13,962. And your association has come to an adverse opinion as to the expediency of the adoption of the three F's?—Yes.

13,963. That is, fair rent, fixity of tenure, and free sale?—Well, free cultivation is an adjunct to the policy of Mr. Smith's Federation, and under that heading the nearest approach to unanimity of feeling in Lancashire can be found. We have more sympathy with that particular point than with any other.

13,964. But you do not consider it expedient to relegate the subject of rent to a tribunal?—Certainly not.

13,965. Will you state shortly your reasons?—First, that it would interfere with what we wish to leave untouched, that is, the absolute freedom of contract between landlord and tenant; secondly, that it would necessitate a very large expenditure, including a large number of official appointments which could only be brought about at extremely great cost, inasmuch as it would necessitate every farm in the country being valued. And we say this, that if you are giving tenants absolute security for the improvements they effect in their holdings they are satisfied without any further fixity of tenure. They do not care about being fixed to the farms further than that they are compensated for the improvements made and for the money spent.

13,966. And they do not think it desirable that the rent should be fixed by an independent tribunal or that a fixed term should be given to them for those rents?—No; take the last five years back it would have meant absolute ruin to a number of farmers if the rent had been fixed five years ago. During that time the prices have been falling and the tenants have been losing money, and under that system they would have been fixed for a number of years, whereas under the present circumstances, though there is room for great improvement, the tenant is free to go at 12 months' notice or six months' notice as the case may be.

Mr. J. Kay and Mr. J. Barlow.

29 Mar. 1894.

13,967. I presume there is the same objection to the term of five years for the rent being fixed by the judicial tribunal as there is to a lease?—Certainly.

13,968. And that whatever objections farmers feel now to taking leases they would feel to having rents fixed by an external tribunal for five years?—Precisely the same objection.

13,969. Would you consider that if a rent were fixed by a tribunal for five years it would be impossible to induce the lessor to make a reduction in the interval?—I think the result of any such tribunal for fixing rent would be to alienate the sympathy that any good landlord has for his tenant, and to call forth any vindictive feeling which a bad landlord has for his tenant.

13,970. And if the falling rents during the last few years had been judicial rents, it would not have been to the interest of tenant farmers?—It would have been very much the reverse.

13,971. They could not have got the same reductions that they have obtained during that time?—That is so.

13,972. Would you state what you think should be done?—We propose an entire alteration in the Agricultural Holdings Act, which we consider is almost inoperative in Lancashire; first, because it is so very expensive; secondly, because its terms are so indefinite and uncertain; and thirdly, because in the few cases which have occured in Lancashire where tenants have taken advantage of it, the claim which under that Act must be sent in by the tenant two months before the expiration of the tenancy is almost invariably met by an enormous counter-claim on the part of the landlord, who has had the opportunity of seeing every item of the tenant's claim.

The Agricultural Holdings Act.

13,973. Now take the first point, namely, that it is expensive. Have you any illustrations to give us on that point?—I think I was the first tenant farmer in Lancashire to fight that case, and the amount of compensation which was awarded to me was 125*l.* Against that the landlord had a very big counter-claim, but he was only awarded some 30*l.* This was a friendly arbitration on which two land agents sat, one for each side, and these two had to appoint an umpire. Though this was a kind of friendly arbitration, my share of the expense for that court was 30*l.* or 30 guineas, I forget which, and unfortunately, I had my own solicitor and my own witnesses to pay in addition. I know that the landlord had at least that sum to pay, if not more; so that the award, which was 125*l.*, had cost some 60*l.* or 60 guineas besides all the private witnesses' expenses.

Expensive procedure of the Act.

13,974. That was independently of your private witnesses' expenses?—Yes; the 60*l.* or the 60 guineas were the official expenses which had to be paid.

13,975. And that was for the determination of 125*l.* on one side and 30*l.* on the other?—Yes. Then, again, I have another objection, and I take that as an illustration. On each side, generally speaking, there is a land agent. Now in this particular case I found that the agent who was acting for the landlord had been brought up in the office of the umpire, and I consider that that fact of itself speaks in favour of an alteration of the law so that official arbitrators in some cases ought to be appointed.

13,976. Did the two arbitrators and the umpire sit together?—Yes.

13,977. So that involved three important persons, experts, hearing this one case?—That is so.

13,978. I presume that the appointment as an umpire of a man in whose office one of the arbitrators had been brought up was rather a mistake of the other arbitrator, and that he probably was not aware of the fact. The umpire was agreed upon, I suppose?—Yes, he was agreed upon. I myself did not know, nor did the land agent who represented me, that the arbitrator had been brought up in the office of the umpire.

13,979. What have you to suggest as an alternative method of investigating these questions of dispute, because I presume they must be difficult questions?—They are extremely difficult.

Mr. J. Kay and Mr. J. Barlow.
29 Mar. 1894.

13,980. And whatever plan you adopt must be attended with some cost and labour?—That is so. We advocate that each county council shall appoint a number of competent valuers, not all to be land agents—in fact we feel very strongly upon that. Certainly not more than one-half ought to be land agents. In every county there are plenty of agricultural auctioneers or farmers who are competent by reason of their education and their experience to deal with such matters, and we think that an equal number of those men should be appointed from each county. We have no objection to that being subject to the Board of Agriculture. The difficulty which presents itself to our mind, and which presents itself to everybody's mind, is in the umpire.

Official valuers.

13,981. Am I to understand that you still desire that each party should select from those official arbitrators his particular agent in the matter?—Yes.

13,982. And that two arbitrators between them should appoint an umpire?—We prefer that in the absence of any better arrangement, but we are not pledged to that particular thing. If the two arbitrators cannot agree we think they should call in a County Court judge as umpire. If a more practical man could be selected, who is totally independent of either the landlords' or the tenants' interest, and who would act for the county, so much the better; but with a view to lessen the cost, and as a County Court judge is good to get at, in the absence of any better arrangement we have suggested the County Court judge as the umpire.

13,983. When you referred to the heavy expenses in that particular case, you mentioned I think, the costs came to 60*l.* between the two parties?—Yes.

13,984. Did that mainly consist of some fees which had to be paid to the arbitrators and umpire?—Almost entirely. I think it took two days, and they charged something approaching 10 guineas a day.

Payment of official valuers.

13,985. Now, these official arbitrators who are to be nominated by the county councils, are they still to be paid by the parties to the dispute?—Yes, we propose that they should be paid by the parties to the dispute, but that their fees shall be fixed, and we quoted as a precedent for that the arrangement under the recent Swine Fever Bill, by which the Board of Agriculture have power, and I believe they approach agricultural valuers in various districts, and get their consent to act in case their services are required in the way of valuation of pigs affected with swine fever, and their fees are named. I think that these fees do not exceed a guinea and a half for half a day, or three guineas for a whole day. There will be no difficulty whatever; and I know this as a practical man, there will be no difficulty at all in getting good men, even land agents, or agricultural valuers, or tenant farmers, to devote their attention to that particular business on such terms.

13,986. What did the arbitrators get paid per day in the case you referred to?—I cannot quite say, but I may say that the expenses were limited. The 60 guineas, or say 60*l.*, were paid to the two arbitrators and the umpire.

13,987. How long did they sit?—Two days.

13,988. But the fees seem to be very heavy for two arbitrators and an umpire sitting for two days only?—That is so.

13,989. That appears to me to be rather the fault of the persons who appointed them, that they made a bad bargain?—There was no bargain made. We simply left the apportionment of expenses to the umpire, and each party has to sign an agreement and undertake to pay to that effect before the sitting commences.

13,990. Then the procedure will be the same; the only difference in your suggestion is that the appointments must be made from a class nominated by the county council and with regulations as to the fees that they shall charge in the future?—Yes.

13,991. That is the essence of your proposal?—Yes, so that either side knows before he goes into his case the basis of the charges that can be made for the work done.

Appointment of umpire.

13,992. If the two arbitrators do not succeed in appointing an umpire I presume that the umpire would not be restricted to the persons named by the county council?—We have suggested the county court judge as the umpire in the absence of anyone better.

13,993. That is if they do not agree?—Yes.

13,994. But it would still be open to agree upon the umpire?—I beg your pardon, if they do not agree upon the award; we do not propose to give them any opportunity of agreeing upon the umpire who shall be the county court judge.

Mr. J. Kay and Mr. J. Barlow.
29 Mar. 1894.

13,995. You mean when they do not agree themselves upon the amount?—That is so.

Schedules of compensation.

13,996. That would be in almost every case?—Well, there is another point there; one of the failings of the present Agricultural Holdings Act is that it is so indefinite, and that there are no schedules, and we propose to remedy that so as to bring it to such a position that any school boy having the voucher before him for the improvements that have been effected could sit down and reckon up without any trouble what the farmer was entitled to under the schedule. We say that the absence of the schedule from the present Act is one of its greatest weaknesses.

13,997. You think if the Act were more definite upon that subject it would lessen very much the difficulties of the arbitration, and would probably enable the two arbitrators nominated by each of the two parties to come to an agreement without the necessity of a reference to an umpire?—Yes, because it would be more a matter of fact than anything else, the claim would be based upon the actual figures of expenditure.

13,998. Still there may be considerable difference of opinion as to the actual amounts which have been expended?—I do not see that you can have any difference of opinion, because at present these claims are regulated by vouchers which are produced. Take, for instance, third-class improvements in the case of provender; the arbitrator is totally unable to go into the matter at all except on the basis of the vouchers produced before him.

13,999. But it is suggested that the compensation under the Agricultural Holdings Act should be extended to the the matter of corn which has been grown on the farm for feeding?—I am aware of that.

14,000. The determination of how much is due to the outgoing man in respect of expenditure on feeding of that kind would naturally give rise to considerable difference as to the fact?—Of course, and I may say that we represent purely grass districts. I do not think in my part of the country that I can find a ploughed field within 10 miles, but as far as I know those suggestions are always accompanied by a stipulation that a grinding record shall be kept and that satisfactory evidence of the home-grown corn shall be produced.

Scheduling of improvements and dilapidations

14,001. What are the precise changes in the Agricultural Holdings Act as regards those points that you have now brought before us, namely, the more precise definition?—That accompanying the Act a distinct schedule, both of improvements and the scale for improvements as well as a schedule of landlord's dilapidations, shall be appended to the Act itself, so that if a man does a certain amount of drainage and he leaves his farm in five years from the time that he has done that drainage he knows exactly how many years he has to claim for compensation for unexhausted improvement, and we think that it is possible to arrange such a Bill and schedule as shall cover everything that a tenant farmer can effect.

Compensation for drainage.

14,002. Has there been any drainage in your district effected by tenant farmers under the existing provisions of the Agricultural Holdings Act?—I do not know of any. In my own farm (I am both a tenant farmer and a small yeoman proprietor) I have found it necessary to supersede the drainage that was done by the Government some years ago. It was absolutely worthless. I consider that anything of the kind ought to be subject to local superintendence.

14,003. Did you effect the drainage yourself?—Yes, but that was on my own land.

14,004. In respect of the farm which you hired, did you effect any drainage?—No. I have a case in point, a farm of 100 acres which I have taken at 14*s.* per acre, but there is no reason in the world why that land should not be worth 25*s.* an acre if it were drained. This is a typical case. The estate is practically bankrupt. I know that it is bound to change hands. I know that I cannot get permission to drain it, and I know if I drained it, it would be at my own cost.

14,005. But under the Agricultural Holdings Act, that would not be so?—I cannot do it without the landlord's consent.

Mr. J. Kay and Mr. J. Barlow.
29 Mar. 1894.

14,006. But you may give notice to the landlord that the land requires drainage, and he has the opportunity of doing it himself; if he does not do it himself, then the tenant is entitled to do it?—Well, but in this case I may say that practically the estate is bankrupt.

14,007. That only comes to this, that the owner of the estate, being bankrupt, is not likely to do it, but under those circumstances you are entitled under the Act as it stands, to do it yourself?—I believe that is so, but this fact remains that provided I did it myself, the probability is that the only person against whom I have my remedy is a bankrupt. It is a very large estate, and I should be very foolish to do anything of the kind.

14,008. But that comes to this, whether the compensation under those circumstances provided by the Act is sufficient—you would not make your claim until you left the holding?—That is so.

14,009. And upon leaving the holding you would be entitled to compensation under the Act as it stands. Whether that compensation as defined by the Act is sufficient is another question, but still you would be entitled to compensation?—Drainage is a question that has not affected us much, because we feel that if the landlord does the drainage, as he does in most cases, (there has been a great deal done by the landlords at the present moment) it is done in lieu of reducing the rent.

14,010 Do you think that if the Agricultural Holdings Act were altered, the tenants would do the drainage or would leave it to the landlord to do?—I think that a good many landlords and tenants would agree with me that drainage is a matter which stands absolutely apart by itself. I believe that it is to the interest of the country, apart from the question of landlord and tenant, that all land should be drained, but there ought to be some means of dealing with mortgaged estates. I know many estates where, however willing the landlord might be to drain the land, he has not the means.

14,011. That is evidently what the Agricultural Holdings Act was intended to meet when it provided that the tenant who wanted his land drained, might give notice to the landlord, and if the landlord could not do it then, the tenant might do it?—But then I would draw your attention to the fact that the drainage of this 100 acres would cost about 800*l.* It stands without much saying that very few tenants in Lancashire have the means of spending 800*l.* on drainage.

State loans for drainage.

14,012. Well, I want to know how you would deal with such a case?—I would deal with it in this way, and I was illustrating it when I was speaking of this as a typical case. The trustees have received notice to pay off the mortgage, and the trustees, I am afraid, cannot find the money. Now I mean to say that if I could borrow or insist upon the landlord or the mortgagee borrowing the 800*l.* necessary to drain that land at something like the terms at which the Government could get the money, the land would be better worth the increased rent to me than it is worth the 70*l.* I now pay. The position of course of the mortgagee comes in, but I am certain that the position of the mortgagee would be better, provided some prior claim was given to the 800*l.*, which we will suppose that the Government advanced, than it is to-day.

14,013. But you are aware that there are societies which will advance money to the landlord for draining the land, charging the land with a certain annuity for a certain number of years which will repay the principal and interest?—But they charge such a rate that it is utterly impossible for the land to pay it.

14,014. But you desire the Government to lend money at a low rate?—Yes.

14,015. That seems to involve the proposition that the tenant as a rule would not be able to do it himself?—I do not think he would.

14,016. Although you might make an additional security under the Act to meet the case where the tenant should effect the drainage, yet you do not think that the tenant would be able to do so?—I do not think that he has the means.

Execution of drainage by Board of Agriculture.

14,017. Therefore in the main you must look as regards the drainage to the landlord, either with or without the assistance of the State?—Yes; but I would make provision that the tenant, in the case of the landlord being unable or unwilling to effect the drainage which the tenant requires, if the landlord is unable to do it that the tenant should appeal to the Government department charged with this particular thing.

Mr. J. Kay and Mr. J. Barlow.
29 Mar. 1892.

14,018. That is somewhat of an extension, namely, if a landlord is unable or unwilling to drain the land himself, and if the tenant has not the money himself to undertake the drainage, that then there should be some process through the intervention of the Land Department, and that the land should be drained notwithstanding the landlord's objections, and that the charge should be put upon it and collected by the Department?—That is so, and the same remark applies to some of the first-class improvements under the present Act. There are some of those improvements which, under the present Act, you are bound to get the sanction of the landlord to accomplish.

Improvements to be sanctioned by official referees.

14,019. What are those improvements?—The erection of buildings, the enlarging or improving or any alteration of roads, bridges, watercourses, making of wells, reservoirs, works of irrigation, supplying water for agricultural purposes, making of fences, reclaiming of waste land, drainage of land, laying down of permanent pastures, and so forth. We consider that if a tenant appeals to a landlord for some of those first-class improvements to be effected and the landlord does not agree that such things would be an improve to the holding, there should be some means of referring to an official referee in the county as to whether those would be improvements or not, so that the question should be decided before the improvements are made, and not left to take their chance when the tenant leaves the farm. If the official referee says that they are unnecessary, and that they are not necessarily an improvement to the holding, they will not be done, but if he gives a certificate that they are necessary and an improvement to the land then the tenant could go on with that certificate, and he would know that by Act of Parliament, according to the schedule, what his claim for compensation should be at the end of his tenancy.

14,020. Then you would interpose a tribunal of some kind on this matter as between landlord and tenant to dispense with the veto of the landlord?—Yes.

14,021. In that case it would rest with the tenant to effect the improvement?—If the tenant wished.

14,022. Do you think, having regard to what you have said about drainage, that the tenants would expend much money in this direction on permanent buildings?—There are many cases in which tenant farmers would do so, especially in the district in my own local association, in the neighbourhood of Blackburn, where tenants are undoubtedly cramped for accommodation for cattle. They would put up buildings provided that they could get permission which, in many cases they cannot get because their landlords are absent or the estates are in Chancery or involved, and the landlords leave it entirely to agents who say they have no power, and for one reason or another they will not agree to anything.

Value of provement to incom tenants.

14,023. Have you anything further to say upon the Agricultural Holdings Act?—Yes. We consider that there are three or four blots on the Agricultural Holdings Act as it is at present. In the first place we do not consider that it is necessary to say what the improvements shall be to the incoming tenant, because a man may be an improving tenant, he may have done his best to farm his land with the approval of the landlord, and in spite of fiscal laws or some other arrangement over which he has no control the value of the land may go down, and that imports an element for which he is not responsible. I may take a farm at 300*l.* and farm it well, and still, in spite of the depression in agriculture, when I choose to leave that farm in three or four years' time I find that that farm will not fetch more than 200*l.* a year. When arbitration cases come on in Lancashire there is a feeling that if a farm when a man took it was worth 300*l.*, and on the tenant giving it up it is only worth 200*l.*, he consequently cannot have improved it. But that is not the fact.

14,024. What clause of the Act would that be?—The Act says that the value of the improvement must be the value to the incoming tenant.

14,025. But you are now suggesting that the fact of the rent of the land having been reduced owing to some fall in prices it would have a bearing upon that case?—For instance, supposing I sent a claim to a valuer he would say, "The proof as to whether this farm has "improved or not is in its ability to command a "tenant."

Mr. J. Kay and Mr. J. Barlow.

29 Mar. 1894.

14,026. The arbitrator who should say that, would not construe the Act rightly?—A great many of them do it that way.

14,027. The value of an improvement appears to me to be totally independent of the fall or rise of rent due to other causes?—That is our contention.

14,028. That is the meaning of the Act already?—That is our contention, but we fail to see the necessity for these words, "the value to any incoming tenant," because if there is not an incoming tenant the landlord has the improvements to pay for.

14,029. Let us suppose the case of a tenant farmer who, with the consent of his landlord, has erected buildings for shelter for cattle, and that at the expiration of his holding he makes a claim. The fact that the rent has been reduced owing to the bad times and fall of prices has no bearing upon the amount of compensation which the tenant in those circumstances is entitled to have?—That is so, and that is our contention, but we find in assessing the tenant's compensation the arbitrators are influenced by the fact that the farm cannot command the rent.

14,030. The point then is to devise some words to make the principle of the Act more clear; it does not import any fresh principle?—I fail to see the necessity of those words, the value to an incoming tenant, because if there is no incoming tenant the landlord has the improvements to pay for.

14,031. Let us argue the point on its merits. Supposing a tenant has put up some buildings very valuable to him for his own purposes, should they be held not to give a permanent value to the holding? Although the buildings which may be erected are valuable to himself and of no value to the incoming tenant, do you say that he should pay for them?—That is precisely what we want to avoid and guard against. The words of the Act are, "of value to the incoming tenant." In the Fylde district, for instance, a few years ago, there was an industry springing up of shire horse breeding. Well, shire horse breeding is not as remunerative as it was, and the tenant may have turned a dairy farm into a horse breeding establishment.

14,032. Is he to recover from the incoming tenant the value of the sheds that he put up for the shire horses?—Under the present Act there is a difficulty owing to the words, "the value to the incoming tenant." The tenant may say, the shire horse business is played out and I am going to revert back to dairy farming. Those improvements are not worth a rap to the incoming tenant. We want to guard against that.

14,033. Do you think that he ought to pay?—I do not think so; but I think that if a tenant appeals to his landlord and says there is a prospect of making his farm do better by reason of erecting boxes for shire horse breeding, and if the landlord consents, it is all right because he gets his landlord's consent. But take the case of the landlord where the tenant thinks that it is from pure prejudice that the landlord will not agree; we propose to call in an official referee who shall hear both sides before the improvement is made, and decide whether it will be an improvement to the holding or not.

14,034. So that in the case you mention, if the external authority should say at that time, that he thinks buildings for shire horses would be of value, yet even if afterwards the breeding of shire horses should turn out to be a failure and could not be carried on, still the tenant on leaving his farm should be entitled to compensation?—I think so. The official referee, having no interest in the matter would be in a position to decide.

14,035. And the incoming tenant has to pay for what really experience has already proved to be a mistake?—Yes, but unless the incoming tenant is willing, of course the landlord has got it to do.

14,036. I only want to know exactly how far you carry it?—I cannot imagine any circumstances under which the Act would not be made stronger by striking out those words, "The value to the incoming tenant." I do not see the slighest necessity for them, I do not see any use for them, but there is a great deal of misunderstanding and a good deal of friction arising from them. Then the next point is with regard to the "inherent capabilities of the soil." That is also another fruitful source of litigation, and I may say that a great many land agents whom I have consulted are of opinion that it might well be left out.

Mr. J. Kay and Mr. J. Barlow.

29 Mar. 1894.

"Inherent capabilitie of the soil."

14,037. Which clause is that?—The end of the first clause, that it "shall not be taken into account as part of the improvement made by the tenant what is justly due to the inherent capabilities of the soil." We propose the striking out of those words altogether which are practically meaningless and are useless, and they are the source of a great deal of litigation and uncertainty. We do not admit that there is any "inherent capabilities of the soil."

14,038. Put a test case, supposing the case of the erection of buildings for shire horses, and supposing it turned out that the speculation was a profitable one and that the erection of those buildings had been a wise course, in view of the production of that farm, do you think that on the expiration of his tenancy or on a change of tenancy, that the incoming tenant should pay anything more than the actual value of the building?—No, because we consider that the landlord is bound to take an element of responsibility and risk on one side, and we consider that he is fairly entitled to any advantage on the other, provided that the tenant gets compensated.

14,039. Then it means that you do not differ from the principle which is included in those words, namely, that you are not giving compensation, you are not to give more than the value of the building?—That is so.

14,040. Quite irrespective of what effect the building may have had upon the production of the farm?—Because we consider that it is a fair give-and-take policy in a case where it might be proved to be a mistake. The building may be absolutely necessary and desirable in order to enable a tenant to go into a new branch of agriculture, and in five years' time it may prove to be a failure. There are bound to be such cases, and we consider that the landlord is fairly entitled to take the improvement if he agrees to take the loss. The tenant in the meantime has got the benefit of the more remunerative farm by reason of those buildings.

14,041. I do not gather that you differ in principle; all that you say is that it gives rise to discussion and litigation, but in principle you agree with it?—But the buildings are quite apart from the question of the inherent capabilities of the soil.

14,042. Now in the case of drainage; supposing it has turned out that the drainage of the land has added to its rental value far beyond the cost of the drainage itself, in your opinion ought the tenant on leaving his farm to take anything more than the value, the cost of effecting the drainage?—No, we propose to base all improvements on actual cost, on the production of the vouchers.

14,043. Then I do not quite see what objection you have to these words, because you agree to the principle involved in them?—No. Supposing I have improved a farm, the agent on the other side is anxious to prove that some portion of those improvements are not due to good farming but that they are due to the inherent capabilities of the soil; well it frequently happens, we see it regularly, that the ingenuity and the business-like ability of a farmer may enable him so to treat one piece of land as to bring out capabilities which have been lying dormant for many years. But we find that these words being retained in the Act have a tendency to prejudice his action in that case by bringing this argument on behalf of the landlord: "oh, this is due to "the inherent capabilities of the soil, it is not due to "the improvements, the inherent capabilities were "there and you have only brought them out." The words are useless and are frequently misconstrued, and we are unanimously of opinion that they ought to be struck out.

Claims and counter-claims.

14,044. But still you think that the compensation should be limited to the cost of the improvement?—Yes, subject to a reservation which I shall make at the end, and it applies to all these things. Well, now, another most important matter we object to is, that as the law stands now, a tenant has to send in his notice of claim two months before the expiration of his tenancy; the landlord, on the other hand, is not required to send in a counter-claim until 14 days after the expiration of the tenancy. Now we consider that that is grossly unfair, and in almost every case that I have known of—I know in my own case the amoun of the landlord's counterclaim was regulated by the amount of my claim; and to several other cases in which I have been interested the same remark applies. In fact I might say that occasionally I am asked to act for both landlord and tenant, and I do not think it is

any breach of confidence to say that I have been instructed to go over a man's farm to make out a counter-claim having regard first to the claim sent in to the landlord; I think that that is very unfair, and the federation make it one of their strong points.

14,045. What would you propose?—We propose that the landlord and tenant should send in their claims on the same day by registered post, so that there shall be no tampering with or knowledge of each other's claim.

14,046. That they should make their claim on the same day?—Yes.

14,047. I do not quite see how either party is to know exactly on what day the other is going to make his claim?—The day shall be fixed; we propose to fix the same day, a month or 28 days before the expiration of the tenancy. If I, as a tenant, have got a claim to make I must send that by registered post to the registrar of the county court 28 days before the expiration of my tenancy. If the landlord has got a claim against me he must send in his claim for dilapidations; but I may say that that gives the landlord a power under our proposed Act which he does not possess under the present Agricultural Holdings Act.

14,048. The reason for giving time after the tenancy is over is that until the tenancy is determined it is difficult for him to say what the dilapidations are?—Except with regard to buildings I fail to see how it is difficult at all. The landlord knows 6 months or 12 months beforehand, as the case may be, that the tenant is leaving, he has generally got an agent upon the spot, and if an agent is worth anything, he knows, or ought to know, how that land is being treated.

14,049. There might be dilapidations to the buildings during the interval?—I do not think that we should be opposed to giving a short term as regards buildings, but certainly not with regard to land.

14,050. You draw a distinction between the buildings and the land?—We have not done so, as a matter of fact, in our resolution, but we should have no objection to that. We want to do nothing but what is fair to both sides.

The law of distress.

14,051. What further point have you to make?—Then we wish to abolish the law of distress. Cases frequently occur of good tenants finding that they can no longer make their farms pay, and they cannot get a reduction of rent, and they leave, and the agent does not exercise that care which we think he ought to exercise in seeing that he gets a *bonâ fide* tenant who is qualified to stock his farm. This tends to increase the competition for the farms which are vacant, and we consider that it imports quite an unhealthy competition.

14,052. You think that it gives an inducement to a landlord to take as a tenant a man with a small amount of capital?—Yes, a man whom he knows nothing about, but who volunteers to give the same rent or more. I may say in my own experience I have known two or three instances; one case where there were three tenants one after the other. A good tenant was allowed to leave his farm because he could no longer agree to give the rent, and his three successors all went wrong. The first committed suicide, the second came with a bill of sale over what he had, and the third was bankrupt. The second tenant who came went to a wheelwright who was also a tenant on the same estate, and wheelwright told me himself this: "I naturally thought "that our agent in selecting a tenant whom we did "not know, would get a tenant who was qualified to "stock his farm. He got a cart from me which cost "20*l.*, and I know that he got various other things "from various other tradesmen, and as soon as his "position was found out the landlord came and took "everything," and his own tenant—the wheelwright—who was on another farm, had simply to accept a private arrangement, and his landlord's claim was paid in full.

14,053. You do not agree with the law of distress as some protection to the smaller farmers who have got small means?—I do not think so. I speak what I know. I do not think that the bugbear which is raised against the policy of the law of distress would prove in reality to be anything like what it is supposed to be. It simply means that the tenant would be called upon to pay in advance. I do not think that would be the case. It would simply operate in the way of causing the agent, or landlord who had not an agent, to make careful inquiries when he selected a tenant, especially a tenant from an outside district. He would want to satisfy himself that the man was in a position to stock the farm.

14,054. You mean by that "bugbear," that there is a difference of opinion?—The bugbear raised by the landlords when opposing the abolition of the law of distress; the land agents almost always say that simply means that the tenants would have to pay the amount in advance.

14,055. Do you think that the tenant farmers in your district are unanimous upon this subject?—The tenant farmers that I represent are unanimous.

14,056. Have you discussed it at your association?—Yes.

Ground Game Act.

14,057. What further have you to say?—Then there is a point which we have not by strict resolution decided to import into the Agricultural Holdings Act, but it is a point which is causing a great deal of friction in Lancashire, that is with regard to the Ground Game Act. If some penalty for the deliberate way in which landlords ignore the Ground Game Act could be imported into the Agricultural Holdings Act, we feel strongly that it would be of very great assistance to the tenant.

14,058. How do they ignore it?—I may say that I have got here three agreements, and those are not selected ones, because I took them over an area of some 12 miles where I live. I stepped on to one estate which is owned by a county magistrate, I do not know that it is necessary to give any names, but any of the Commissioners could see them. This is an agreement (*producing the same*) signed by both landlord and tenant, and which is in operation now. I may say in passing that this of course has been signed and drawn up since the passing of the Ground Game Act, it is only two or three years old. In it there occurs this clause: the said rent "does not include the taking, "killing, or destruction of ground game; if, therefore, "the tenant or any person authorised by him, mem-"bers of his household, resident on the demised "premises, or any other person *bonâ fide* employed by "him for reward in the taking, killing, or destruction, "of ground game, shall kill, take, or destroy any "ground game on the demised premises, the lessee "shall pay to the reversioner or reversioners, as addi-"tional rent, the sum of three shillings for every rabbit, "and six shillings for every hare taken, killed, or "destroyed, and every such additional rent or sum "shall become due and payable immediately after each "hare or rabbit shall have been killed, and the lessee "shall immediately thereafter report to the reversioner "or reversioners each and every instance of such "taking, killing, or destruction, and, in case the lessee "shall fail, neglect, or refuse to report any case of "such taking, killing, or destruction of ground game, "he shall pay to the reversioner or reversioners the "sum of ten pounds as and for liquidated damages for "every such case that he shall so fail, neglect, or refuse "to report as aforesaid."

14,059. You are aware, I suppose, that that condition is illegal?—Certainly, but every tenant on this estate has signed it, and it has a very prejudicial effect on this particular estate. I have myself seen, within the last week, a state of things which ought not to exist on any estate. The rabbits running about on these farms are simply disgraceful.

14,060. You are aware that there is a clause in the Ground Game Act specially to prevent that?—Certainly.

14,061. The question is, how further could you strengthen the Act of Parliament, so as to prevent a thing of this kind?—It ought to be done. I have not selected those cases. I take them one after the other for 12 miles round, going from Longridge to Darwen, and I can step on the land all the way. Now this is another case, and this is a letter written by a friend of my own; it is dated February 23, 1894, and addressed to a tenant farmer:—"Dear Sir—I have had a letter."—I will not mention names—"from Mr. [ ], the "tenant of the shooting and fishing over the estate of "the late [ ] complaining about your having "been caught carrying a gun"—he has a gun license—"and shooting over a portion of the estate"—that is his own farm; that is to say, his own holding—"this "cannot be allowed, and if repeated he says that he "will prosecute either you or anyone else found doing "so in future. He has also asked for my assistance "and co-operation in putting a stop to it, and I have "given my word that I will assist him in every way

"possible to put a stop to either the tenants or others "trespassing in pursuit of game on any portion of the "estate he has the right of shooting or fishing over, "and he has my full authority to prosecute anyone "(no matter who) found so doing."

14,062. That does not appear to be directed so much against ground game?—Oh, yes it is.

14,063. As against ordinary game?—No. This is a case of an estate of 3,000 acres, the owner of which died last year. I knew the owner intimately, and I know from personal knowledge, because I rented a farm under him once, that he detested rabbits and gave his tenants full authority, no matter what other landlords did, to kill every rabbit they found, and the tenants are simply doing now what they were allowed to do before, but this is stopping them. This man was simply killing rabbits as he has done ever since he went to the farm, and this applies to the killing of rabbits. A third, and a stronger case is the case of a member of Parliament. The largest tenant on his estate in the year 1891 was asked by the other tenants to do something, to approach the landlord, with regard to the state of the rabbits on their farms. This is a very big estate and a very valuable estate. The largest tenant drew up this memorial: it is not a long one, but it will show you that it was written with every wish to be courteous and civil and respectful to the landlord. If I may read it, it read as follows:—"Dear Sir, The memorial of us "the undersigned is as follows.—(1.) That we are "unanimously of opinion that we are undue sufferers "from being over-run with rabbits. (2.) That we have "frequently complained to the keepers and other "persons of this annoyance. (3.) That occasionally an "effort has been made to meet our wishes, but no "systematic course has been adopted, and in conse-"quence little good has been the result. (4.) That we "venture to think that the fact of our rabbits being "caught with the 'long net,'—that is the system of killing 100 at once or 200 as the case may be—"is con-"clusive evidence of two things, viz.: that the rabbits "are not preserved for sport and that they are too "numerous to be shot. (5.) That by virtue of a recent "Act of Parliament rabbits are the property of the "tenant. (6.) That the tenants on the above estates "feel justified in asking for the application of this Act "to be enforced on their respective holdings. In "conclusion, the tenantry approach you with every "feeling of personal respect, and will only be too glad "to see you preserving hares or pheasants." I may say there are very few hares in this particular neighbourhood—"and will join heartily with you in any such "endeavour; but rabbits having so enormously "increased since the death of"—the former owner—that was the father-in-law to the present owner—"it "becomes necessary that an understanding be arrived "at, as our stocks and land are alike suffering from "what we declare to be a pest, and we are unanimously "of opinion that the Ground Game Act being put in "operation is the only real way to give effect to our "wishes and to remove our grievance."

14,064. What was the answer to that?—The answer to that was this, that the tenant who drew up that memorial drew it up on the Monday; he was on the best of terms with both his landlord and his agent, he never had a wrong word with either of them, the memorial was sent round on Tuesday and was signed by 45 tenants out of 55, and on the Wednesday the notice which I have in my hand was sent to him without comment to quit both his holdings.

14,065. (*Mr. Whitehead.*) Can we have the date of that?—The notice is dated the 28th of January 1891.

14,066. (*Mr. Lambert.*) What is the date of the memorial?—It was two days before this.

14,067. Is it dated?—I have only a copy of the memorial, but I have the original notice from the landlord to quit.

14,068. If you had a copy of the memorial you would have it dated, would you not?—No. This was two or three years ago and it was not thought that it would ever be required; but I got it, and I know that this is an accurate copy. I saw it and read it. The memorial was drawn out on the Monday, it was signed on the Tuesday, and the tenant, who was the largest tenant on the estate, and who was on good terms with his landlord and his agent, received this notice on the Wednesday without comment. An attempt was subsequently made to make it appear that there were other reasons for the tenant receiving notice, but it is well known in the district that this was not so. To prove it, I may say that I have the agreement on which the farm was let, which specifies that only six months' notice—this is written across—is necessary. Therefore if it had not been for the action of drawing up this memorial the notice would not have required to have been sent until the 2nd of August; but this notice is sent on the 28th of January, two days after the memorial was drawn up.

Mr. J. Kay and Mr. J. Barlow.
29 Mar. 1894

14,069. (*Chairman.*) Then you deduce from that that the fact of this tenant having been the leader of the other tenants in this action against the landlord about ground game led to the notice to quit being given to him?—I know that that was so.

14,070. You say that the tenants in that case petitioned that the Act might be enforced?—Yes.

14,071. I presume you are aware that it does not require the consent of the landlord for the enforcement of the Act?—That is so. We are quite aware of that; but I know from speaking to landlords in the south of England that they regard these things with feelings of great incredulity; they cannot believe that such things are done, but the evidence is here.

14,072. Would it not have been better for the tenants in that case instead of requesting their landlords that the Act might be enforced, to have announced to him that they intended to enforce it themselves?—The result would simply have been this: this is an estate close to a large town on which the farms can be readily let, and the result would be the selection of some half a dozen by the agent; the agent has always some means of finding out who is taking a part in such a thing as this, and who is taking the lead in it. He very soon found out whose writing this memorial was.

14,073. I think you said there are 30 tenants on the estate?—No; the memorial was signed by 45 tenants out of 55 in one day.

14,074. It appears to me to be a case where combination might have been very valuable; if they had combined together to say we intend to avail ourselves of the rights which the law has given to us, and that you must evict the whole or none of us?—There is a reason why that would have been very difficult. This estate is within three or four miles of a town with 120,000 inhabitants, and attached to it every farm by a life-time's work the tenant has got what he calls a milk round, or a milk connexion, which is very valuable; if those tenants were compelled to leave their farms I do not think that the landlord would have much difficulty in replacing them.

14,075. Do you think that if the tenants had combined in common action, and had announced their intention to avail themselves of the privilege which an Act of Parliament had conferred upon them, any landlord in the country could have ventured to evict the whole of them?—On that particular estate about one half of them are very great sufferers from these rabbits, because they are in the direction of the parks and woods; the other half of the tenants are not at all affected, but they have sympathy with the others, and of course they signed the memorial.

14,076. Now what further security do you think could be obtained to prevent action of this kind?—I consider that it is just as dishonourable for a landlord to ask a tenant to sign a thing like that I read to you as it is for a landlord to put his hand into the pocket of the tenant and take out a sovereign. It is an act which I should describe by a very strong term, and I think he ought to be penalised where there is proof. There is no difficulty of proof in this case; I could find abundant proof that it was simply on account of that memorial that that tenant had to go.

14,077. You say the landlord should be penalised?—Yes.

14,078. Somebody, I presume, would have to put the law in force?—Yes.

Compensation for capricious eviction.

14,079. Does that not involve the same difficulty that is involved in the assertion of the right under the law as it now stands, namely, that the tenant who should endeavour to put the penal law into force might be subject himself to the penalty of eviction?—I said just now that these suggestions which we made were subject to a qualifying term, which I should just mention at the end. We say that that would come under the heading of capricious disturbances—there could not be the slightest doubt about a case of that kind. The tenant in that case had raised the tone of the farm altogether; extra buildings had been put up;

Mr. J. Kay and Mr. J. Barlow.
29 Mar. 1894.

I know as a fact that when the landlord and the agent were asked to put up extra shedding, they looked with surprise at the tenant and said that he would never be able to keep that stock of cattle; but in less than two years he was able to keep that stock of cattle by means of the improvements that he had effected on the farm, and he was able to dispense with some meadow land and turn it into pasture.

14,080. I suppose you will admit that in the case of the tenant having security of tenure in the form of a lease he would not be subject to this action of the landlord, and that he could assert his right to the game with impunity?—Yes; but the tenant farmers we represent do not want leases.

14,081. I know; but is it not an incident of the unwillingness of the tenant to accept leases and to take leases that, having only a yearly tenancy, they are rather more at the mercy of their landlords than they otherwise would be?—That is so; but we propose a safeguard by the suggestion that for capricious disturbance such as this it could only be held to be an additional per-centage that should be allowed; that in addition to the ordinary compensation which the Act gave him a scale of compensation for capricious disturbance should be attached, based on the amount of capital which a farmer had involved in his holding.

14,082. Then, of course, it would require some definition of what capricious disturbance is?—Yes; there comes the official referee again, and the necessity for him.

14,083. I mean is it to be entirely at the discretion of the official referee to determine whether the disturbance has been capricious or not?—We think so.

14,084. Or would you define it under the Act?—Well, we should define it. We have not gone into this because, as I said at the first, we were not quite clear whether it would be better to advocate a clause in the Act with regard to the ground game—and that comes on to the question of capricious disturbance—or a separate Bill, but I think it would be much better myself seeing that there is great difficulty in getting legislation that the whole thing should be incorporated in one Act; and I do not think I should have any difficulty in showing that a tenant who has to leave for such a cause as I have read to you, has to leave owing to the caprice of the agent.

14,085. But it might not always be easy to connect the one thing with the other?—At all events it would be easy to compel the landlord to appear and give a definite reason why the tenant had to leave. I may state that in that case, when the friends of the landowner remonstrated with him, he wrote to the tenant and said it was with a view to taking the farm into his own hands. That showed a disposition to try to get out of the real cause, but as a matter of fact the farm was immediately let, and it is let to-day.

14,086. Does it not come round to this, that that would indirectly lead to the judicial rent?—No; I do not see what it has to do with the rent.

14,087. The landlord might give notice to the tenant to quit; the tenant would then go before this referee to complain of the capricious eviction; the question then would be whether the landlord was willing to allow the tenant to remain on at the reasonable rent?—If the landlord wanted to take the farm into his own hands, that could not be held to be capricious disturbances. He would give a reasonable ground for it, and therefore he would be liable to pay the ordinary compensation, which the Agricultural Holdings Act would give to the tenant.

14,088. I am supposing that instead of giving him notice to quit, the landlord should raise his rent, or ask a higher rent, and that if the tenant did not pay, then he would have to go: I presume that is a question that would go before the referee that you have suggested?—Yes.

14,089. As one which might involve a capricious eviction; then does it not come round to this, that it leads to the referee having to decide what is a reasonable rent?—No, I do not think so; it would come rather to the referee having to decide what is the reasonable compensation for disturbance.

14,090. I do not want to cross-examine you upon the point, I only want to know which is your view?—Our views are that where a tenant can prove that for such a frivolous reason as that notice has been given him to quit, though he has farmed well——

Mr. J. Kay and Mr. J. Barlow.
29 Mar. 1894.

14,091. I have been putting the case where instead of it being possible to connect immediately the eviction with some act of that kind, the landlord instead of adopting that course were to say: "I intend to raise your rent by 5*s.* an acre," would that be a matter for which the referee should be entitled to say, "That is a capricious eviction," and to give a higher rate of compensation?—I think it would be quite open to the official referee, to receive evidence on both sides.

14,092. I am suggesting now that the only evidence that is producible is the claim for the higher rent?—Yes, but surely the tenant would have his wits about him, and if he had got anything in his possession of the nature that I mentioned just now he would be able to recall the circumstances which would be bound to be within his own knowledge, of any little disagreement that had taken place between the landlord or agent and himself.

14,093. But, as I have said, it might be difficult to connect the one with the other?—I can quite imagine that it might be difficult. On the other hand I have shown you instances where there would be a very clear case.

14,094. I think probably if there were such a law passed as you suggest, the landlord would not be so unwise as to make his eviction immediately after a proceeding of that kind, but that he would bide his time?—Yes.

14,095. And make his claim for a higher rent; I am only now suggesting difficulties in your course as I want to see whether you are proposing what is likely to effect its purpose. I am certain we all sympathise with you in your wish to put an end to such cases as you have referred to, but it may be perhaps open to doubt whether your proposals would have that effect, may it not?—Yes.

14,096. (*Mr. Lambert.*) It would be left to reasonable men to decide whether or not the rent was being raised unnecessarily?—Yes.

14,097. Or upon the tenants' own improvements?—Yes

14,098. And reasonable men would therefore give a reasonable decision upon the matter, and if they thought that a tenant was being evicted for other reasons than bad cultivation, or such things as that, they would award him fair compensation?—Yes.

14,099. And no injustice would be done to the landlord?—We propose a definite scale in addition to the ordinary compensation; that means to say, that if I, as a tenant farmer, had got an award of 500*l.* in my favour, and if I had succeeded in showing that I had been compelled to go for a capricious reason in spite of my good farming, then there should also be a schedule under that heading which would enable the arbitrators to give a more substantial sum. We contend, and I am sure all practical agriculturists will agree with us, that a tenant cannot possibly effect the sale of his stock, or move from one place to another without incurring a very serious loss. If he voluntarily gives notice to leave his farm, that is his own look out; but, if on the other hand, he is compelled for such trifling reasons as we have named, to leave a farm where he is farming well, we consider that such a penalty should be attached to the landlord's action in that matter as would act as a deterrent against his pursuing it.

14,100. (*Chairman.*) And you look therefore in this direction to the means of deterring actions such as those you have adverted to in respect of the ground game?—Yes; in the last case that I mentioned I may say that the thing is practically left to the agent; to a very great extent he has supreme power, and if it had been possible to get substantial damages owing to that frivolous eviction, I think that that agent would have hesitated very much before he had given that notice.

Depression in the Blackburn district.

14,101. Has there been much agricultural depression in your district?—In the immediate district of my local association, that is around Blackburn, I may say that we have not felt the depression so acutely as they have in many other parts of Lancashire; but speaking for a wider district, that covered by the federation, there certainly has been great depression during the last three or four years.

14,102. Not till then?—Not on the dairy farms; on the outside farms many of whose tenants are members of our associations, where they are engaged either in the bringing up of young stock or in grazing pursuits,

Mr. J. Kay and Mr. J. Barlow.

29 Mar. 1894.

the depression has been going on more or less for 10 years.

14,103. But where there have been dairy farms in the neighbourhood, I presume, of the towns, they have not lost till the last two or three years?—That is so.

Cattle disease.

14,104. Has that loss been owing to the lower price of milk?—No. This is a point that we feel very strongly upon. One great source of the dairy farmers' troubles within the last three or four years has been the action of the medical officers of all the corporations throughout the county in condemning the carcases of really prime fed cattle which after slaughter have shown indications of suffering from tuberculosis. This was a thing which very rarely occurred up to within three or four years ago; but it seems to have been more largely discussed by medical men, and corporations have been acting in a very high-handed manner during the last three or four years.

14,105. That is to say, they have condemned cattle (on the supposition that the cattle had been suffering from tuberculosis) as unfit for food, I suppose?—Yes; but of course it is not a supposition, because they condemn the cattle after slaughter, and they can tell from the condition of the lungs distinctly that the cattle have been suffering, although prior to slaughter there is no judge in England can tell.

14,106. Then do you think they were right or wrong in condemning them?—If they are right it is in the interest of the public that they are right. But I say, and the federation say most strongly, that if it is for the protection of the public that our animals are confiscated to such an alarming extent, the public ought to bear the cost and the disease ought to be scheduled under the Contagious Diseases (Animals) Act. I may say truthfully that we are never a single week without suffering the loss of good animals in some of the towns covered by our federation. I would respectfully venture to draw the serious attention of this Commission to that, because we have got statistics which we could not have otherwise got, owing to the prevalence some three years ago of pleuro-pneumonia in our district, from which we are able to say with certainty, not selecting any particular district, but taking the county as a county, that, taking young stock, full grown stock, and all kinds of stock together, whether, dairy, grazing, or other sorts, we have grounds for saying that one out of every five of the animals in Lancashire is suffering from this disease. If those animals suffer in the slightest degree the medical officer thinks that makes them unfit for food, and that means an absolute confiscation of 20 per cent. of the entire value of cattle in Lancashire. We feel this very much, and it is one of the greatest causes of depression in Lancashire, more particularly in the dairying districts.

14,107. Do you think that they have drawn the line too tight, and that many of these cattle which they condemn are not unfit for food?—We say, and we say it with some degree of confidence, that if an animal has fed herself or himself so well as to render a disease beyond the power of detection of the local authorities when it is alive, it ought not to be condemned when dead. I may say that, in order to get this evidence on oath, two years ago we had a case in Blackburn where a cow was sold by a very honourable and straightforward farmer to a very straightforward and honourable butcher, and it was sold for a larger sum than any other cow killed in Blackburn fetched that week, and Blackburn is a town of 130,000 or 140,000 inhabitants, and a large number of cattle are slaughtered there. That cow was sold in the light of day to a practical man by a practical man for more money than any other cow that was carried into Blackburn that week. The veterinary surgeon accidently saw it; the meat inspector actually saw it when it was alive; and it was admittedly one of the best cows that we had had in Blackburn for some time; the cow was killed, the inspector's attention was drawn to it, and in the lungs the traces of tuberculosis were quite clear. The farmer at once admitted his responsibity although he had no need to do so, but being an honourable man he took the whole blame upon himself, if there was any; he said, "I sold the animal for a certain price to the "butcher, and after doing so my responsibility "ceased; but having fed that animal and having "grazed it all the summer I feel a moral liability "if there is anything wrong with it, and that "I ought to be the sufferer and not the butcher." Therefore he assumed the responsibility. In that case the farmer was summoned before the magistrates in Blackburn. I may say in passing that one of our great misfortunes in such cases is that we have no agricultural magistrates acting for the borough, the magistrates who are interested in agriculture or who understand agriculture are invariably county magistrates, and we suffer very seriously for the want of that knowledge which a county magistrate generally possesses, but which a borough magistrate knows nothing whatever about. The farmer was summoned; my association took this matter up, and we called in the best medical evidence we could get—we called in Dr. Dresfield, of Manchester, who is the head pathologist there. He at once said: "Gentlemen, "this is a very hard case, but the law is clear, it gives "absolute power to the medical officer to say whether "or not such cases are fit for food; the medical "officer has condemned it, and, therefore, you have "not a leg to stand upon." The local butchers joined us in fighting this matter; it cost us something like 60*l.*, and it cost the corporation about 100*l.* When we found out that we had no case we asked the permission of the magistrates to call the veterinary surgeon, and this is the evidence that he gave; that under the pleuro-pneumonia regulations a number of animals were affected on the outskirts of Blackburn, and that it was necessary to slaughter no less than 451 animals which were taken in one district just because the animals had been in contact over the hedge and taken right away without any selection at all; there were all kinds of stock; 451 animals were slaughtered, and it was his duty on behalf of the Government to report on the state of health of those animals, and out of the 451, 85 showed unmistakeable signs of tuberculosis, that is one out of every five. We have every reason to believe that that is a correct statement of the state of our herds in Lancashire, and not only in Lancashire, but it is very keenly felt in London, in the neighbourhood of London, in Scotland and in Ireland, I may say that our federation was the prime mover and the prime causer of the National Conference in St. James's Hall. Our federation having persuaded the business committee of the Central Chamber with which we are connected, to see the desirability of calling this conference it might be asked why if the Agricultural Holdings Act is of such primary importance we did not speak on that point. This Commission might ask me how it was we did not take up the matter of land tenure and speak about it through any of our representatives at the Conference, but devoted our attention to another subject. Although we thought and felt that the Agricultural Holdings Act was the first item on the programme, and that we ought to try to remedy it; yet we felt sure that other neighbourhoods would be taking up that question, and as this tuberculosis was a matter pressing so very severely upon us in Lancashire and we were not quite sure how far it affected other parts, we decided to confine ourselves to that question at the conference in St. James's Hall.

Mr. J. Kay and Mr. J. Barlow.

28 Mar. 1894.

14,108. Please state what you think ought to be done?—We say that what ought to be done is that compensation ought to be paid for these animals condemned in the interests of the public, and that the disease ought to be scheduled under the Contagious Diseases (Animals) Act.

14,109. That is the point of your contention, that when these animals are condemned by the inspectors at the markets in these towns, compensation should be given to the farmer?—Yes.

14,110. Do you also think that where animals on a farm are suffering from tuberculosis they should be slaughtered and that compensation should be given?—Yes. I think, and in fact I am sure, that the farmer is the first man to have his attention drawn to this. If there is an animal suffering the farmer is the first man who will find out that there is something wrong with it. We think that the same regulations ought to be adopted in this case as are adopted with regard to pleuro-pneumonia, namely, that the farmer ought to announce the existence of the disease to the authorities, and that the animal ought to be taken, and that the farmer ought to be paid for it.

14,111. Then you think that this difficulty about the condemnation of animals suffering from tuberculosis has been the cause of considerable loss to the farmers in your district?—Yes. I may say that there have been instances this week, last week—in fact I cannot say that there has been a single week in which in

some of the towns embraced in our federation some of our farmers have not been called upon to have a good animal confiscated.

14,112. (*Mr. Everett.*) Do I understand you to say that in most of the cases the farmer himself was quite unaware that his animal suffered from anything at all?—That is so. I may say further that when we put the veterinary surgeon on oath in the case that I have just spoken of in Blackburn—it was spoken about all over the country at the time—the veterinary surgeon on his oath said that neither he nor anyone else could detect any signs of disease in this animal when it was living, but the result was this: that the farmer not only lost his cow but—I forgot to name this—although he is one of the most respectable men in the district, he had the indignity of being fined 2*l.* and costs. We appealed to the chairman of the magistrates under the circumstances to give an expression of opinion which we could put before the Government to show that we were very unfairly treated. The chairman who of course had no sympathy whatever with farmers and knew nothing about farming simply replied in these words, which I think I remember: "There has been a "clear breach of the law. With regard to anything "else we have nothing whatever to do. If it occurs "again you will be more severely dealt with." That was all the sympathy we got.

14,113. (*Chariman.*) As I understood, your losses in these cases largely account for the difficulties of the farmers in the neighbourhood of the towns?—Yes; a man never knows when he is safe.

Price of milk.

14,114. Has there been a reduction in the price of milk?—There has not been an absolute reduction, but there has been increased competition, and I think the result has been that a great many more bad debts are made.

Letting of farms.

14,115. When farms are vacant in that district, are they easily let?—Generally speaking, I think I ought to say they are; there is not a great deal of difficulty, because they are close to large tows.

14,116. There are other people ready to come in?—Yes.

Reduction of rent.

14,117. Have the rents been much reduced?—I do not know, except in the case of the Fylde estate. I have reason to know, after going through the books, of a very prominent land agent there, who very kindly showed me what had been done on his estates, that there have been several reductions there during the last 10 or 12 years; but in the other districts I cannot say that there have been more than isolated cases of reduction. There have been a good many cases, I may say, of temporary abatements.

14,118. Temporary abatements, but not permanent reductions?—That is so.

Marking of foreign meat.

14,119. Then, I presume, you are ready to speak upon the subject of compulsory labelling of meat?—Yes.

14,120. And upon the subject of margarine?—Yes.

14,121. I do not think we need go into those matters, as they have been dealt with by other witnesses. I believe you are also prepared to speak on the subject of taxation of land?—Yes. I would say, in passing, that our federation have a strong feeling with regard to the labelling of foreign meat. We framed a Bill, or assisted in the framing of a Bill, which was taken charge of by Mr. Yerburgh. I think Mr. Yerburgh proposed a Bill some years ago, and we thought that, possibly, he was the best man to take this matter up for us. We did not approve of his Bill at all, and we suggested a good many improvements, and I think our suggestions have been mainly embodied in the Report of the Select Committee, except in one direction, that we strongly advocate the imposition of a very small licence on these people who are engaged in the trade—such a small amount that it could not possibly be supposed for a moment that there was anything in the nature of protection, but that it should be, say, half-a-sovereign per year, in order to enable the Excise Authorities to trace the men who are actually engaged in the business.

Fall in prices.

14,122. (*Mr. Everett.*) You say in the minutes of your evidence that you attribute the agricultural depression to foreign competition; might I ask you what you mean by that?—I am speaking of agriculture as a whole, and of course I am alluding mainly to the importation of cattle, the importation of beef and mutton and other fat stuff; we feel that in our district.

14,123. That is you have suffered from a fall in prices, which fall you attribute to foreign competition?—Undoubtedly.

The three F's.

14,124. (*Captain Owen Thomas.*) You said in your evidence in chief that the three F's have been frequently discussed in your association; were there many members for or against?—Mr. Barlow and I have been discussing that this morning. I do not think out of the 700 members we have that we have 20 in the whole of the association, we have not more certainly, who are favourable to the three F's policy. But I may say on the other hand that I know, and we all know that there are very large minorities in the federation that Mr. Smith represents who are strongly in favour of an improved Agricultural Holdings Act.

Scale of compensation for manures.

14,125. I think you also said that you believe a fixed scale for manures would satisfy all farmers?—Yes.

14,126. Are you not aware that manures last much longer in some parts of the country than in others?—Yes; we have considered that subject, and it is practically on all fours with the question that was put to me about the depreciation of certain kinds of buildings. On he uselessness of certain kinds of buildings as against the importance and the necessity of such buildings we say there the landlord ought to reap the benefit of any great advantage to the holding without giving extra compensation because he would have to take the risk of a loss; the same with regard to this question. I know that in some cases, lime, for instance, will last 20 years; I know that in other cases it will not last more than five years; but we take a wide view of the matter and put all our knowledge together, and we think that it is quite possible to put such a limit as shall be fairly reasonable all round.

Reductions in rent.

14,127. About the reduction in rent, you say it is not general in your neighbourhood nor in the district?—It is not.

14,128. May I ask what you would consider a fair reduction which really would satisfy the tenant if made by the landlord in your part of the country?—I think it is admitted on all hands, some of the more reasonable agents in our district are prepared to admit it, that the productive powers of the land have depreciated something like 25 to 30 per cent. We consider it would be fair if we got a reduction of 20 to 30 per cent. according to the circumstances. We wish to draw attention to this:—A man may get 30 per cent. reduction in one case and he may be no better treated than another who only gets 5 per cent. reduction, because the circumstances vary so greatly. Some lands are highly rented and some are reasonably rented, so that it is impossible to say that you can fix a hard and fast line on a given number of estates and say that they were entitled to 30 per cent. reduction all round; one man may be better entitled to 40 per cent. reduction than another who may be entitled to 10 per cent.

Impoverishment of soil.

14,129. You say the land has depreciated 25 per cent. in production; what do you mean by that; do you mean that prices have fallen?—No. I mean the land itself owing to the gradual process of impoverishment which has been going on. The tenants have not been able to do, perhaps, what they would like to do, and we have had a lot of bad seasons. Altogether, I do not think that the land produces as much as it did some time ago.

Low prices.

14,130. What would you say is the average reduction in the prices of farm produce at the present time?—It depends upon the period you take.

14,131. Say during the last five years?—Say the last 10 or 12 years; it amounts to something like 30 or 40 per cent. in the price of several articles, such as beef and mutton, but more particularly beef.

Rent and prices.

14,132. Do you think the rent ought to be reduced in proportion to the reduction in prices?—I think that it is a matter of supply and demand. When times are bad, of course farms become vacant, except in such cases as I am speaking of close to a town where the milk is the great support of the farm, but outside, in grazing districts, farmers cannot pay the rents they formerly paid, and if a farmer leaves his farm, of course, it is for another man to go, and he looks at the farm, and if he thinks he can give a certain price he offers it, and if he does not he leaves it.

14,133. You say they are paying nearly all round in your neighbourhood?—When I was saying that I meant close to the towns.

Mr. J. Kay and Mr. J. Barlow.

29 Mar. 1894.

14,134. Close to the towns?—Yes; further away in the grazing districts there is considerable difficulty in getting tenants at the same rent.

14,135. I think it is generally admitted that the rent is one-third of the liability of a farm; I mean to say that a farmer has to make his rent three times to clear a living, do you agree to that—is that your opinion?—I know that in the majority of cases the farmer is not making it once, let alone three times.

14,136. I mean not net; I mean the gross receipts?—That is the assumption, but I think it is rather high.

14,137. If prices have fallen say 30 per cent., how do you propose to reduce the two-thirds, if the rent is only one-third of the expenses on a farm?—In our case we say that the rents generally speaking are 25 per cent. too high.

14,138. Yes, that is one-third of the liability of a farm?—25 per cent. is a fourth.

14,139. I mean that of the amount a farmer must make up on a farm the rent is one-third?—Yes, I see what you mean. Then as we represent, as I said at first, more particularly a dairying district, we say distinctly that this question of tuberculosis is a matter which has come to the front during the last three or four years, and that means an absolute loss to us of from 10 to 20 per cent.

14,140. (*Mr. Lambert.*) Is there a great deal of land mortgaged in your district?—Yes.

Mortgages.

14,141. Then the owners have not the unrestricted liberty of doing as they please with it?—I believe that is so.

14,142. Presuming that such land were freed from these mortgages, would it conduce to improvements being more generally carried out?—Yes, I quite think so; in fact, I am sure that it would.

14,143. Do you think many owners, although they have the will to do it, have not the power?—I know some; I know others who have the means and will not do it.

Law of primogeniture.

14,144. Would you be in favour of the abolition of the law of primogeniture?—I may say that is a matter that does not arise in our district.

Mortgages.

14,145. Would you be in favour of the compulsory registration of mortgages, or have you not considered that question?—We have not; but I quite admit that some such scheme would be necessary in the case I have mentioned of having power to execute a prior mortgage to the Government for the drainage of land where the landlord was unable to do it; it would be absolutely necessary that a proposed mortgagee should be made aware of it.

Rent.

14,146. I think you say that the land is rented 25 per cent. too high in your district?—Not all round; there are some cases where the land is let fairly reasonably; there are other cases where it is let very unreasonably high.

14,147. Why is it let unreasonably high?—Because in some cases the depression has affected them more acutely than the others. For instance, take the outside farms where they have got to buy their grazing cattle in the spring, feed them all in the summer, and sell them off in the autumn; it is an absolute impossibility for those farms to produce anything like what they should produce.

14,148. Why are they paying such an unnecessarily high rent?—There is a gradual change of system going on in Lancashire; on one estate last year 40 notices were given.

14,149. From the landlord?—From the tenants to the landlord.

14,150. Would these men probably stay on if they had a fair reduction of rent?—Yes. I may say that in that case the agent took a very proper course, he went and saw every tenant, and I believe in every case gave in.

14,151. (*Chairman.*) That seems to show the advantage of combination?—Yes; they all went together. I may say that that particular agent told me himself that farmers' combinations were all very well, but he would never listen to anything that came from an organisation of tenant farmers, nor would he receive any deputation from one. His words to me were "I am prepared to deal with any tenant of mine singly;" and they gave him an opportunity. They went to him collectively, but he came to them and dealt with them singly.

14,152. (*Mr. Lambert.*) So that the tenants had to go to the extreme course of giving a notice to quit their farms in order to get a reduction of rent?—Yes, that is so, and it is frequently done.

Mr. J. Kay and Mr. J. Barlow.

29 Mar. 1894.

14,153. Of course in that case they often have to go out of their farms?—There are scores of cases occurring of that kind.

14,154. And they have to go to the expense of changing?—Yes.

14,155. How much would you estimate the cost upon a man's capital of changing into another farm?—20 per cent.

Judicial rents.

14,156. When there are such cases as this happening why are you opposed to an outside interference in the fixing of rents?—In the first place I, as a practical farmer, send my milk and butter into the market, and I fail to see, however much I may feel aggrieved at the particular action of my landlord, why I may go to him and say, "You shall be compelled to take a certain rent," when I go to the market the following day and I have got some cows to sell, or some bullocks to sell, or something else to sell, and I take the market price, and if I cannot get it I keep them. The landlord ought to be able to do the same with his land.

14,157. Then he has the right to do as he likes with his own?—Well, so long as he does not hurt anybody else. I fail to see that I ought to be a party to depriving the landlord of that liberty which I myself as a tenant farmer demand.

14,158. Now I want clearly to understand this point. Do you advocate the landlord doing exactly as he pleases with his own farm?—Provided he pays for any damage that he inflicts upon anybody else in doing so I certainly do.

14,159. How could you estimate the damage that he inflicts upon a tenant by charging 25 per cent. too much rent?—Simply because I should say that that is an attempt to capriciously cause the tenant to leave, and that is where my point comes in with regard to the 20 per cent.; in addition to the ordinary compensation which the Agricultural Holdings Act would give him I should give him 20 per cent. for frivolous eviction.

14,160. And would you place under that category of frivolous eviction a refusal to lower the rent to a reasonable amount?—No, I should not say that; I do not think that is a frivolous eviction.

14,161. You would not put charging an unnecessarily high rent under the category of vexatious disturbance?—I do not think I should do that, because I should leave it entirely to the official referee to look at the circumstances, to take into account the rent that was being paid by the neighbours for a similar class of land: to weigh how the farmer had farmed his land, and (of course after hearing both what the landlord had got to say and what the tenant had got to say), I think that a practical man would be able to decide whether it was a capricious disturbance or whether it was not.

14,162. Then you would in some instances place limitations upon the power of the landlord doing as he liked with his farm?—Certainly; provided he was doing an injury.

14,163. Would not charging an unnecessarily high rent be an injury?—If it was clearly proved that the landlord had some reason for which he wanted to part with the tenant—and it might be a case such as I have referred to—and in order to get at it he said that he would raise the rent. There would be a means found to prove that. I think I should not have any difficulty in proving that in any of those cases; if the rent had been simply advanced or offered to be advanced I should have no difficulty in tracing the effect to the cause.

14,164. But supposing a tenant was paying 25 per cent. more rent than the land was worth, and that he asked for a reduction, and the landlord refused to give it, would you give the tenant any compensation for being obliged to quit his holding?—We have not contemplated that at all; we do not propose to regard that as a case in point.

14,165. Does not stocking a man's farm with ground game by the landlord come to the same thing; does it not injure the tenant's rent producing facilities?—Yes.

14,166. Therefore are not the placing of too high a rent and the existence of too much ground game in the same category?—We regard it in this light; a tenancy is a free contract; a landlord has a certain quantity of land to let; a tenant requires a certain quantity of land; a free contract is made, and if the tenant improves his farm he has a ready means of getting paid for those improvements. The greater the improvements the more he will get paid. We say that that will be a deterrent against the landlord trying either to raise the man's rent or to part with him in any shape or form, because he will know at once that he will be met by a very large claim.

14,167. That is not the point of my question. My point is this: you allow, in the case of disturbing a tenant through exercising his right under the Ground Game Bill, compensation for vexatious disturbance; now for charging a tenant too much rent for a farm, would you not place that in the same category; if not, I want to know what is the difference between them?—The difference is this, because a tenant has made one part of the bargain, he knows that he has agreed to give a certain amount of rent and he has done it with his eyes open.

14,168. Take the case where agricultural produce has depreciated as it has now within the last 10 years?—Very well, then the tenant finds that he is no longer able to make the profit from the land that he contemplated when he took it, and he has the power of going to the landlord and saying: "I can no longer make "a profit from this land, and I am either going to "have it at a less rent or I leave. If I leave I shall "bring in such a claim as I feel I can substantiate."

14,169. Then if the landlord is charging the tenant too much rent the tenant has the opportunity of leaving?—Just exactly the same as if, when I am trying to sell a cow, I try to charge a purchaser too much for it; he has the option of going away and buying another.

14,170. Would that not apply the same in reference to ground game?—No, I think it is on another basis altogether; it is practically an attempt to take that which is absolutely the property of the tenant.

14,171. Would not paying too much rent be in the same category as taking that which absolutely belongs to the tenant?—I think not. I can see a great difference.

Restrictions on cultivation and on sale of produce.

14,172. I will not pursue that matter further, but it seems to me to be very much the same. You advocate less restrictive conditions of cultivation?—Yes.

14,173. How will you obtain them?—By simply striking out a number of those very extraordinary restrictions which, I think, prevent a tenant from farming with a view to really improving the land and improving his own circumstances without damaging the farm.

14,174. There you are again going to curtail the rights of the landlord?—Yes; provided the tenant does not do anything calculated to impoverish the land we say there are a lot of obnoxious restrictions which ought to be removed.

14,175. Who is to decide whether the tenant is doing anything detrimental to the land?—We propose that the landlord's claim for dilapidations shall be equally clear and explicit as a tenant's claim for improvements.

14,176. But supposing that during a tenancy the tenant wants those restrictions removed, he having entered into that agreement as you say with his eyes open, why should you want to take away the landlord's power?—I understand I am supposed to be giving evidence now with regard to the depression in agriculture and the means of improving it, and I say that if you remove some of those unreasonable restrictions which tenants are labouring under on all estates more or less in our district, you will be putting into the hands of the tenants a power to make money where they cannot make it now. I will give you a case in point. During the last year it was within the knowledge of every farmer—it was well known everywhere, that hay was going to be a serious item, and that hay was going to be at a very much improved value. My knowledge of the district is such that I can speak with confidence, although I have not looked at those documents that you have before you, that they will prevent the tenant from selling hay without the landlord's written consent. I may tell you that on one estate represented by those agreements this thing was carried to an absurdity. One farmer who had manured his meadows every year and kept a full stock, had so cultivated his meadow land that he had a surplus of hay. His next door neighbour—the next farmer on the same estate—ran short of hay. The large tenant and the small tenant met casually together and agreed for the sale of one load of hay, and it was taken to a village half a mile away to weigh. This was reported to the agent and before the hay was returned to the farm the agent had visited the farm, and had told the tenant that if this thing occurred again he would have to go, because he knew very well that he had not the power to sell hay.

Mr. J. Kay and Mr. J. Barlow.

29 Mar. 1894.

14,177. What authority would you allow to step in to prevent a tenant from impoverishing the farm?—I think that a very reasonable thing would be for the landlord to insist that where a tenant carted away hay in such a case as this off his holding he should bring back a corresponding portion of manure. This the tenants in my neighbourhood would be very willing and glad to do, but the landlords in those agreements, although I have not read them in every case, will not allow it.

14,178. That is quite true, but my point is this: during a tenancy a tenant sells off hay and straw and otherwise impoverishes the farm; what authority are you going to allow a landlord to appeal to to prevent that?—I should not allow him to appeal to any authority except this, that the tenant ought, and he can do it without any appeal to anybody, to give satisfactory evidence that he is going to bring back, or that he has brought back, an amount of manure corresponding to the manurial value of the produce that he is taking off. The tenant ought then to be master of the situation, and ought to be able to sell off what he likes.

14,179. But supposing he is impoverishing the farm?—He cannot be impoverishing the farm. How is it possible to impoverish the farm if I take a given quantity of hay, and I bring back a given quantity of manure which corresponds to the manure taken off the farm by reason of the hay being sold? How am I impoverishing my farm?

14,180. But supposing he does not bring back the manure?—I say he must bring back the manure.

14,181. But who is to be the judge as to whether he brings back the manure?—He has got the vouchers and produces them at the rent audit.

14,182. Supposing he does not produce the vouchers?—Then it is a debt which can be recovered the same as the rent.

14,183. Would you allow a landlord to step in during a tenancy, and say to the tenant, "You must pay me so "much more rent because you are impoverishing the "farm"?—No; he would have to prove that the tenant was impoverishing the farm.

14,184. I want to get at how the landlord would prove it?—He would prove it by this official referee that we propose the county council should appoint.

14,185. Now we are getting at it; that is my point. I want to know what authority you would allow to step in between the landlord and the tenant in this case to decide between them?—It is exactly like a case under the Agricultural Holdings Act.

14,186. Would you allow the official referee to decide as to whether restrictions were obvious and deterimental or not?—Yes.

14,187. Therefore you would in that instance, too, curtail the power of the landlord?—Yes, because he was trying to take away from the tenant his power of cultivating the soil.

14,188. Would that create a bad feeling between landlord and tenant?—I fail to see that it would, because there are many districts in Lancashire which I do not represent, where tenants have free powers of sale; there is no bad feeling there.

14,189. Then if that would create no bad feeling, why would the fixing of the rent by an outside tribunal create bad feeling?—I have not said that it would create bad feeling. I say that it is a costly, cumbrous process, which is unnecessary.

Land courts.

14,190. I thought you said that it would alienate the sympathy of a good landlord?—Undoubtedly, it would.

14,191. Do you think a good landlord would be brought into a land court?—I know frequent cases where good landlords, most estimable men themselves, have got very bad agents, and they are very loth to

interfere with the management of those agents. I know other cases where bad landlords have good agents, so that you cannot draw a hard and fast line.

14,192. Of course, that is not my point. You can only take the agent as an employé of the landlord, and you must take the landlord as represented by his agent. Do you think that a good landlord, charging a reasonable rent, would be taken by any tenant into a land court to have the rent fixed?—Very few landlords live on their property, they nearly all reside away, and the estate is left entirely to the management of the agent; and one strong grievance I have against agents is that they are not always practical men.

Fixing of rent.

14,193. Who fixes the rent of the farms?—The rent is already fixed; the tenant is already in possession, and pays a certain rent. If the tenant leaves, then somebody else applies; "What is the rent?" The rent is what the old tenant has paid. "Very well, I will not give it." If the landlord gets it, he gets it; if he does not, he has to take what he can get.

Land agents.

14,194. Then the tenant has to do with agents who are not practical men?—Yes, frequently; that accounts, to a great extent, for a good many south country landowners failing to grasp the difficulties that we have to contend with in Lancashire. One of those difficulties arises from the agent simply being a rent collector of house property. The landlords in many cases have become more or less impoverished. They have not been able to keep up the same efficiency of management, the same agency that they used to have when times were better, and there is a strong disposition to say, "I will do without a permanent agent, I will put "it into the hands of this man," who is simply a collector of cottage rents and a house agent in the town.

Absentee landlords.

14,195. So the landlord develops into merely a rent charger?—Where he lives absent from his locality, that is so.

14,196. Are there many instances of his living absent from his locality?—A great many.

14,197. With reference to the case you mentioned about the ground game, did the tenant have to leave the farm according to the notice?—Yes.

Capricious evictions.

14,198. Did he make many improvements on the farm?—When he went to that farm, as I said, he was in a large way as a dairy farmer, and required additional accommodation for some 30 beasts; both landlord and agent expressed their surprise that he should make such a demand, because they thought the place would not keep them; when he received the notice the place was keeping them, and he was also able to turn some meadow land into pasture. That shows on the face of it that he did improve it.

14,199. That the tenant did improve the farm?—Yes.

14,200. (*Mr. Everett.*) What do you mean by changing meadow land into pasture?—When this tenancy began the tenant knew that he would require more meadow land, that is to say, more mowing grass, hay grass—that is what we call meadows. I know there is frequently a difference of terms; we call meadows that land which we mow; the other land we call pasture land. In this case he knew that he would require more meadow land, more mowing land, and he got them to agree to it, and when he had been there two years he had so much improved the land that he was enabled to turn it back to pasture.

14,201. (*Mr. Lambert.*) You seem to know a good deal about the case; how much do you calculate that those improvements were worth?—The bulk of those improvements are improvements which are not as well provided for in the Agricultural Holdings Act as we think they ought to be.

14,202. How much do you think they are worth. I want your opinion on the subject?—I should think 200*l.* would be a very reasonable estimate.

14,203. How much did the tenant recover under the Agricultural Holdings Act?—Such cases never occur. The tenant simply went away.

14,204. So he practically lost 200*l.* through the landlord using his right of capriciously evicting him?—Yes.

14,205. And he has had also the expense of changing farms?—Yes.

Notice to quit.

14,206. Do you think that the six months' notice is a reasonable notice for a landlord to give his tenant?—I myself prefer the 12 months' notice. I think six months is scarcely reasonable.

14,207. You would make it compulsory?—I think it would be decidedly better. I am very glad that you have raised that point, because there is something of equal importance hanging on it. In Lancashire we have varying terms of entry and it is the cause of a great deal of evil. The general rule in our neighbourhood is that a tenancy commences with regard to the land on the 2nd February and with regard to the buildings on the 12th May. On some estates an agitation was got up some years ago, and a few agents agreed that on their estates they would make the 2nd of February operative in all cases both with regard to land and with regard to buildings. This is acting most unfairly, and in this way: supposing there are two tenants living next door neighbours to each other but under different landlords, one may have to give up land and buildings on the 2nd of February and the other may not give up his buildings and house till the 12th of May. Now, supposing the man who has to quit on the 2nd of February, wants to take a farm on another estate, he has to clear out of his own farm on the 2nd of February, but he has nowhere to go to till the 12th of May. That is a great evil and although there must be a difference with regard to purely grass land, which ours is, as apart from mixed farms and arable land—they would probably want to make a different arrangement—yet in grass farms it would be very much better if all tenancies commenced both with regard to land and with regard to buildings at the same date, say the 2nd of February.

14,208. In this agreement that you have produced the Agricultural Holdings Act is expressly evaded by giving a six months' notice, is it not?—That is so.

14,209. You think that in instances great injustice may be done to the tenant when the Act is so evaded?—Yes.

14,210. So you would make it compulsory on the landlord to give 12 months' notice?—Yes.

14,211. And that the Act should not be so evaded?—That is so.

14,212. Are such stringent restrictive leases as these general in your district?—Those are fairly average agreements drawn without any care on my part simply taken haphazard from the entire district, and they are fairly representative of the conditions which obtain in the whole district of East Lancashire.

Marking of foreign meat

14,213. How would you propose to distinguish foreign from British meat?—We have considered that matter. I should propose that all butchers dealing in foreign meat should pay the very small licence of 10*s.*

14,214. That is not my point. My point is: how will you differentiate between British and foreign meat. Supposing two joints of meat were put on the table, or you saw two joints of meat in a shop, one was foreign, and the other was British, how would you distinguish between the two?—I do not say that I could do in all cases, but in many cases I could on account of the difference in the fibre, just as I can tell the difference between cows' beef and bulls' beef.

14,215. If you could not do it in every instance would it be a sufficiently reliable test?—No, I do not think it would, and that is why we strongly advocate the point of all people who deal in it paying a small license: I do not care if it is only half-a-crown.

14,216. How are you to prove that they do deal in it?—How do you prove that a grocer is dealing in snuff and tobacco, and things of that kind?

14,217. I beg your pardon, I will not go into that; I want to ask you the question?—We put it precisely in the same way, that a grocer is dealing in these articles for which he has to pay a license.

14,218. How are you going to prove that a man is dealing in foreign meat when there is no test which distinguishes foreign from British meat?—There is this test: that you can go to the *abattoir*, you can go to Birkenhead, or you can go to Manchester, or wherever it is, and you can demand to see the books of the wholesale dealers, provided you pass an enactment to that effect; it is our contention that by that means the Excise Officer will be able to trace who are the customers, and if he is able to trace them he goes to Birkenhead; he finds that John Jones is dealing in this meat; John Jones' address is there; he goes to it, and he finds that he is dealing in foreign meat, and yet he is not announcing the fact.

14,219. Then, presuming that he does announce the fact, there are no means to prove that he could not sell

Mr. J. Kay and Mr. J. Barlow.

29 Mar. 1894.

foreign meat as British meat, the same as he ever did?—There is this fact, that, except in certain classes of foreign meat, it is decidedly inferior to the British meat.

14,220. That is not my point; my point is this: there is nothing to distinguish foreign meat from British meat, and if the man took out a license or was registered to deal in foreign meat he would have exactly the same power as now to sell foreign for British meat?—Unless it was made a penal offence, and that is what we propose.

14,221. How are you going to prove it?—As I say, from the books of the wholesale dealer. All meat comes from certain centres. We know in Blackburn, Preston, and various other towns where this meat comes from—it all comes from Birkenhead.

14,222. My point is this: you go into a shop, and the butcher presumably sells you British meat, and it is foreign meat, how can you prove the foreign meat to be British meat or the British meat to be foreign?—I cannot in all cases, nor can anyone else, except it has come over dead; if it has come over dead I should have no difficulty in proving it at all. I can take you through London and find you lots of it.

14,223. I perfectly well know that; but I am introducing a Bill on the subject, and I want to get at the best information?—You cannot possibly get at it, and you may as well give it up as try to get at it, unless you start at the fountain head, and go to the wholesale markets, and give an official the right to examine those books and trace the customers.

14,224. Very good; but then when you have traced the customer the man has exactly the same power of selling British meat as foreign and foreign meat as British as he had before?—Yes.

14,225. Because you have no test to distinguish between the two?—He is bound to announce the fact that he is selling it.

14,226. Supposing all butchers do announce the fact?—All butchers do not; that is the evil.

14,227. I had a conversation with a London butcher and he immediately said they would be bound to announce it because they all sell foreign meat, therefore, presuming that all butchers did announce the fact that they were dealers in foreign meat—which they are—how would you distinguish between British and foreign meat when it is sold by the butcher to the consumer?—In the first place I do not believe for a moment that all butchers deal in foreign meat, except you are referring to sweetbreads.

14,228. Of course that is foreign meat?—That is a point that we have considered and we have come to the conclusion that you cannot include sweetbreads, you cannot call that foreign meat.

14,229. There of course you go into exceptions?—I think that is the only exception. Might I be allowed to say what the butchers themselves say from the mouth of their own president, and the president is a member of Parliament. He expressly states that he is agreeable to this Act being passed.

Tuberculosis.

14,230. (*Mr. Whitehead.*) I only want to ask you one question about tuberculosis; you say that 20 per cent. of your cattle in Lancashire are affected with tuberculosis?—Yes.

14,231. Or were affected at a certain time; and I think you said you got it from statistics of animals slaughtered for pleuro-pneumonia?—Yes.

14,232. How is it possible to distinguish the tuberculosis affection from the pleuro-pneumonia affection; would not the symptoms be very similar?—There are no symptoms at all of tuberculosis in its preliminary stages.

14,233. But there are when the animal is slaughtered?—That is what the veterinary surgeon said.

14,234. Did the veterinary surgeons distictly say that they were affected with tuberculosis?—That 85 of them were distinctly affected with tuberculosis, and it was given on oath.

14,235. Independently of pleuro-pneumonia?—Yes.

14,236. Is tuberculosis so general throughout the country, do you think?—I have a list giving the extent in various centres of England.

14,237. You think that it is?—I think that it is very prevalent; in some places more, in some places less, and it is in Scotland and in Ireland as well.

14,238. You propose that it should be scheduled?—Yes.

Mr. J. Kay and Mr. J. Barlow.

29 Mar. 1894.

14,239. How do you propose to schedule a disease that is not apparent upon examination?—Of course, we suffer through those animals being taken, which we cannot tell are wrong, therefore, we say a farmer should be compensated for them. The anomaly of the present law is this, that although I am prevented from selling what every practical man would say is a prime fed animal, although that animal is confiscated, yet I am not prevented from selling the milk from an animal in the last stages of that disease, and that milk is consumed by the public; therefore, we say that from a public point of view, it is very important that this should be scheduled.

14,240. That would mean that a farmer should be compensated for every animal that was found affected with tuberculosis, and condemned for that?—Yes, because it is quite possible, and it is frequently done. I have seen scores and scores of cases—that an animal which is not worth a sovereign, may be yielding to the very day of her death six or seven quarts of milk a day, and that milk goes to the towns.

14,241. Are the medical officers of all authorities equally as stringent as those at Blackburn seem to be?—Yes.

14,242. Do they condemn the animals as universally?—Yes, at Blackburn, Darwen, Southport, Liverpool, Birkenhead, and all over the country. I know that in Scotland there was a case of two bullocks which some time ago were sold, I believe, for over 50*l.* each.

14,243. Do you know whether it has been decided absolutely that such meat is injurious to health?—It is left entirely to the option of the medical officer.

14,244. Of the individual medical officer?—Yes. A Commission have been sitting on this matter for four years, and the very fact of their taking such a long time to make their report is our strong ground for stating that there must be an element of uncertainty, which justifies us in demanding that the authorities should stay their hands until that report does come out.

14,245. Some authorities, as a fact, are very much more lenient than others?—Some authorities are, but in Lancashire one authority seems to be copying another, and I do not remember a week when one good animal is taken. One was taken this week; two were taken last week, and every week some good animal is taken.

14,246. Do you think that depends on the state of the disease, or what organs are affected?—No; if it is found at all in the lungs. Here is a strong point that I wish to draw the attention of the Commission to with regard to the importation of foreign meat. Foreign meat comes from abroad dead without any lungs. Now if you will give an average butcher three minutes' start of the sanitary inspector after opening the beast there is no sanitary inspector who can find that the animal has been suffering from tuberculosis.

14,247. It is only from examination of the lungs that it can be shown, then?—That is so. The dead meat comes from abroad without the lungs, and consequently we have no proof whatever but what we are allowing tuberculous meat to come in from abroad whilst we will not allow it in England.

14,248. Are you aware that in Denmark distinctions are made as to the meat?—Yes, I am aware of that.

14,249. Would you suggest that they should prevail in England?—We consider, as I said at first, that if an animal is sufficiently well to enable it to feed and to graze into a good carcase of meat, and to defy detection alive, the meat cannot possibly be injurious to the public. That is, in the absence of the Report of the Royal Commission.

14,250. (*Chairman to Mr. Barlow.*) I understand you come from the same district as Mr. Kay?—Yes.

14,251. And are a member of the same association?—Yes.

14,252. You have been deputed by that association to come here?—Yes.

14,253. You have heard Mr. Kay's evidence to-day?—Yes.

Compensation for improvements.

14,254. Have you anything to add to what Mr. Kay has said?—I should like to make the basis of compensation on the determination of the tenancy rather clearer.

Mr. J. Kay and Mr. J. Barlow. 29 Mar. 1894.

14,255. Will you add anything that you have to say upon that point?—So far as the tenancy being determined goes the 1883 Act from my experience of both working it and seeing its working is that it has become a dead letter in consequence of the latter part of the clause, as Mr. Kay has already told you. There are many points which are brought up which seem to some to point to a court having to be created in consequence of having to determine the value to the incoming tenant on the determination of the tenancy of any improvements that have been made by the quitting tenant. We say that the Act of Parliament whatever it is based upon ought to be made sufficiently clear and sufficiently definite, so that any child in the Third Standard can be able to tot up at the end of the tenancy the amount of compensation that is required to be given to the outgoing tenant, we say that that ought to be paid without litigation and without any doubt whatever to either the outgoing tenant or his successors or her successors whoever they may be. We say that the 1883 Act if made sufficiently clear upon that point would give so far as that goes a very good basis for a new Tenant Right Bill to be based upon. We say that schedules ought to be issued clearly defining three classes of improvements, first, second, and third class. With regard to first class improvements and Mr. Lambert's question as to whether the sitting tenant's paying too much rent and the consumption of the grass by rabbits or other things were not in the same category, we say that in that case what we have said about compulsory disturbance has not been considered by the association. When we are speaking here with regard to compulsory disturbance so far as our Bill has been gone into, we have never gone into that question of compulsory disturbance. Mr. Kay and I have had some conversations, but I must be candid, we speak and must only speak on behalf of ourselves so far as regards compulsory disturbance.

14,256. (*Mr. Lambert.*) Compensation for compulsory disturbance then is not a part of the programme of your association?—No, it has not been hitherto.

Compensation for compulsory disturbance.

14,257. Have you ever discussed it?—Not in the association—not that I am aware of. It may have been casually mentioned, but it has never been seriously discussed to my knowledge. In consequence of its having been discussed outside recently we have considered that it is a very serious question indeed, though we have no authority to-day to say what our opinions are except as speaking on behalf of ourselves. I think it is only fair to those whom we represent to say so. My opinion with regard to any disturbance, whether it be capricious or otherwise, is that if it be a compulsory disturbance of the sitting tenant, the sitting tenant ought from many points of view to be compensated whether he is going to quit in consequence of destroying rabbits that were devouring his fodder, or whether it is because he is paying too much money, or whatever it may be. Compensation for compulsory disturbance in my opinion ought to be inserted into our Bill; but we have not considered it hitherto; I think, if it was put in, that whatever the cause the tenant should have notice, for it should not be incumbent upon the tenant to show that it was in consequence of having shot a rabbit or whatever it was, he should only be required to show that the landlord had given him notice for compulsory disturbance, and that he had worked up a connection with regard to cheese-making, or to milk, or to anything of that sort, and then for that trade or that connection that he has worked up I think he is really entitled to some compensation.

14,258. (*Chairman.*) But it is a matter which has not been discussed by your association?—It has not been discussed.

14,259. And you are speaking your own individual view?—Yes, that is so.

14,260. Except on that point you agree with what Mr. Kay has said to-day?—Mainly so.

Dairying in Blackburn district.

14,261. (*Mr. Whitehead.*) With reference to the dairy farms near Blackburn, you know them equally with Mr. Kay, I suppose?—Yes.

14,262. Does dairy farming increase round about Blackburn, or does it decrease?—I never knew much ploughing there—there has been very little indeed. There has not been much increase.

14,263. In spite of an increasing population?—Dairying has increased, but it could not increase much owing to the fact that there was not much ploughing in that neighbourhood.

Mr. J. Kay and Mr J. Barlow. 29 Mar. 1894.

14,264. What size are these dairy farms?—They vary from 30 to over 100 acres in Mr. Kay's district; in our part of the district, in Rossendale, we have not very many large ones.

14,265. Thirty to 100 acres?—(*Mr. Kay.*) 100 acres is considered a large farm in Blackburn.

14,266. Would it be worked entirely by the tenant and his family?—Yes. We have no agricultural labourers in our district.

14,267. No agricultural labourers?—No; a man and his family are working a dairy farm from 4 o'clock in the morning till practically 8 o'clock at night. (*Mr. Barlow.*) I pay men, but I do not look upon them in the light of agricultural labourers the same as they are in the south.

14,268. Are they not actually hired?—They have wages paid them. (*Mr. Kay.*) But that is only a case where a man has a berth on the farm. (*Mr. Barlow.*) I pay 25*s.* a week to one, and to the other 15*s.*

14,269. In most of these cases are these tenants prospering with this dairy farming?—No. I cannot really say that they are in our district, so far as I know. The best proof of that is, that they are constantly leaving their farms.

14,270. Why is that; they work themselves, and they have a great demand for their milk, of course, in a town like Blackburn; can you explain it?—In the position that I have occupied for nearly 20 years, I have proved both by my experience and by going amongst them, that many are reduced to that position that they cannot carry on.

14,271. From want of capital?—Yes, the capital has been constantly going; it began in wet seasons about a dozen or 14 years ago, and it has kept gradually declining: the rates have increased in some districts, and the returns of produce have been less, and the rent has not gone down along with that. To my astonishment, though they have done, as far as my observation has gone, all they possibly could to avert the calamity that really seemed coming on them, they have not been able to persuade their landlord or agent to reduce their rents, and when the rents have been reduced they have been reduced generally to new tenants. I regret to find that that is rather the rule.

14,272. (*Mr. Everett to Mr. Kay.*) In regard to the hours, how long did you say the hours are accustomed to be on these dairy farms where they employ no labour; how long do the people themselves work?—They must be up at 4 o'clock in the morning in summer, and 5 o'clock in winter in order to get their cows milked, and their milk in the towns for breakfast. Then there are two kinds of "kitters," we call them "kitters" as an abbreviation because they take their milk in the kits. If they take the milk twice in the day they have got to be there again about 7 o'clock at night, deliver their milk round, and it is frequently 9 o'clock when they have got home, got their horse stabled and done their work.

14,273. So that it is a very hard life?—Yes; you will find the farmer, and you will find his wife and his sons and his daughters all turned out at 5 o'clock in the morning, and all milking the cows.

14,274. Do you suppose that the money that they earn in the year is equal to a very high wage?—I am sorry to say that that is where the trouble is coming, these young people have been expecting that their parents have been able to put something by for them in the way of wages, but I am very sorry to say that almost invariably the same tale is told to them, and that when they want to get married and to make a home for themselves, they find that their parents cannot afford to give them anything, and the consequence is that the younger generation are flocking into the towns, and the old people are having to work in their old days, when they ought to be doing something else.

14,275. The remuneration that they and their families are receiving off their farms is less than they would earn if they were working for wages for other people?—Undoubtedly. I may say that where I live there are scores of mill operatives who are living in houses at 3*s.* a week where they are bringing into the house from 2*l.* to 3*l.* 10*s.* per week; but there is nothing of that kind in farming.

14,276. So that the extension of this small occupier system would not look to have any gospel in it for

Mr. J. Kay and Mr. J. Barlow.

29 Mar. 1894.

working people?—I do not think that in our district it would be at all required or taken advantage of.

Decrease in fertility of soil.

14,277. You were saying that the productive capacity of the land in your opinion had decreased in the last few years?—Yes.

14,278. Do you think that the selling of milk continuously off the land has been a considerable element in that?—I do not think so at all. My experience is just to the contrary. Mr. Lambert asked me what I thought a tenant who had had to quit for the rabbit business had improved his farm, and I said about 200*l.*, that was altogether an improvement out of what we call white provender. The Act does not give very much compensation for the consumption of sack provender, the manurial value is not so great, but the majority of these farms are so small and the number of cattle kept is so large that they are practically kept upon sack provender alone, the consequence is that a man is able to manure not only the meadow land, the mowing land everywhere but a portion of his pasture; consequently he is bound to be improving it. I can give you instances. One farmer I have in my mind who has been at a farm 14 years and is leaving it now; when he came to the farm it would only keep eight cattle, but it is now keeping 22.

14,279. The productive capacity of that farm has increased?—Yes. I am speaking now of purely dairy farms, but outside, owing to the tenants becoming gradually impoverished, they have not been able to spend much in fertilisers, two seasons have been wet and against the land, and I am satisfied that the yield, the fertility of the land, in those cases has decreased very considerably.

14,280. I suppose the farmers in your district buy a good deal more feeding stuff than they grow to sell?—They do not grow any. I, myself, on my dairy farm, which is only 44 acres in extent, have 31 full-grown milking cows, and I am not able to grow sufficient hay for them, and the pasturage has to be helped out with the large amount of provender which I buy. I spend 400*l.* a year in provender.

14,281. The fall in the price of corn and cake has really benefited you on the one side of your holding?—It has.

14,282. But not so much as you have suffered from the fall in the value of stock, I think I understood you to say?—No; and this question of tuberculosis is now facing us, and it is a most serious matter.

The witnesses withdrew.

Adjourned to to-morrow at 12 o'clock.

Twenty-fifth Day.

Friday, 30th March 1894.

PRESENT:

The Right Hon. GEORGE JOHN SHAW-LEFEVRE, M.P., in the Chair.

The Right Hon. Henry Chaplin, M.P.
Captain Owen Thomas.
Francis Alston Channing, Esq., M.P.
John Clay, Esq.
Cornelius Neale Dalton, Esq., C.B.
Robert Lacey Everett, Esq., M.P.
George Lambert Esq., M.P.
Charles Whitehead, Esq., F.L.S.

Herbert Lyon, Esq., *Secretary.*
R. F. Crawford, Esq., *Assistant Secretary.*

Mr. E. Turnor.

30 Mar. 1894.

Mr. Edmund Turnor called and examined.

14,283. (*Chairman.*) You are tenant for life of an agricultural estate of 21,000 acres in Lincolnshire, are you not?—Yes.

14,284. And you act as your own agent?—Yes, I practically do. I have a couple of clerks, but I look after the whole thing myself.

Rental.

14,285. What is the present rental of the estate?—Last year it was 20,398*l.*; that was the nominal rental as it stood on the books, but then I returned 10 per cent., and then there were the arrears. The actual sum I received in that year was 16,549*l.*

14,286. Of that 2,240*l.* were arrears?—And the rest was returned in consequence of the bad season.

14,287. The rest was a temporary abatement?—Yes, a temporary abatement of 10 per cent.

Comparison between 1878 and 1893.

14,288. Will you compare that with the year 1878, before the reductions began?—That was 29,067*l.* gross rental, and there was an arrear of 1,253*l.*

14,289. I suppose your actual receipt in that year was the difference between the gross rental and the arrears; there were probably no abatements then?—There were no abatements; there was that amount of arrear.

14,290. Therefore your net income for 1893, as compared with 1878, was reduced from about, roughly, 28,000*l.* to 16,000*l.*?—Yes, it was.

Expenditure on improvements.

14,291. During that time had you expended large sums on improvement?—Yes, I think there is a statement here as far as I can make it out; it was not very easy to get out; I made it out in various years. Beginning in 1830 down to 1893 it is about 155,000, but I think that is below the real amount.

14,292. That would be at the rate of about 2,300*l.* a year?—Yes, that is excluding ordinary repairs of maintenance. It is simply for new repairs and drainage.

14,293. Has that amount been maintained during the last few years, since 1888?—I have got it here from 1842 to 1874 about 85,000*l.*; from 1874 to 1886 about 21,000*l.*; and from 1886 to 1893 about 11,000*l.*

14,294. You have not maintained that expenditure the last few years?—No, the income has fallen off, so that it is impossible to maintain it.

14,295. In many cases we have been told that the landlords have been compelled to spend more in consequence of the period of depression in order to keep their tenants?—I do not think that is the reason. The estate is in very good order from all this money having been spent there, and very few buildings and cottages are wanted.

14,296. You have evidently spent considerable sums of money upon it in the way of improvement?—Yes.

14,297. And you were able to do rather less during the last year in consequence of what you had done before?—In consequence of its being in such good order.

Reduction in rent.

14,298. The nominal reduction of rental has been about 30 per cent.?—Yes, if you take the larger farms alone it would come out nearly 40 per cent. I think, 35 to 40. Of course there are the smaller holdings, and then the cottages which are not reduced; they are let at a low rental.

Mr. E. Turnor.
30 Mar. 1894.

14,299. What would you put as the acreage of a large farm as compared with a small one?—I can hardly give you that; I have not worked it out.

14,300. Roughly speaking would a large farm be 400 acres or more?—Some 600 or 700; they vary; they are of all sizes.

14,301. How many farm tenants have you got?—I will fill that in later. I will give you the details and the rentals at different periods.

Land in hand.

14,302. Have you much land in hand which has been thrown up by tenants?—I am farming now about 4,200 acres, but that includes a park and the home farm; you may take off 700 acres for that perhaps.

14,303. Deducting that, then, you have 3,600 acres in your hand?—Yes.

14,304. Besides that had you many other farms thrown on your hands during the last few years?—Yes, an acreage of 4,277, I think. Altogether since I succeeded in 1886 I have had 5,427 acres vacant from deaths and tenants leaving, and I have let 4,277 out of that and about 1,150 I have kept in hand.

14,305. When were these 4,200 acres let—quite lately?—I have got all the details here—the dates and the acreages and the number of applications for them.

The letting of farms.

14,306. Have you let many farms within the last few years?—In 1894 I let 229 acres for which I had seven applications—that was not advertised; then 454 acres, two applications—that is a farm I had in hand since 1889: and for another small holding of 46 acres, which was not advertised I had three applications.

14,307. You say that you let a farm this year of 229 acres which I presume you would call a small farm?—Yes, it is a small holding.

14,308. You had seven applications for it?—Yes, seven.

14,309. Was that at any reduction of rent?—No, the same rent as the old tenant paid.

14,310. How much did it work out per acre?—About 15*s.*

Demand for farms.

14,311. Would you say there is still a demand for small farms in your district?—For small farms up to 200 or 250 acres there is a fair demand.

14,312. At a fair rent?—Yes, at a fair rent—of course nothing like the rents of 20 years ago.

14,313. A reduction probably of 30 per cent. as compared with then?—Yes, I should think quite 30 per cent.

Average rent.

14,314. What would be the average now per acre?—I should think I have not many over 1*l.*; they are under 1*l.* an acre.

14,315. About 1*l.*?—Yes.

Land laid down to grass.

14,316. Has much land been laid down to grass?—I have laid down about 927 acres since 1881—that is laid down with a view to its standing. Then the practice has grown up of letting the land lay down in what we call seeds three or four years besides.

14,317. Has there been a considerable reduction of arable land?—To that amount there would be, and of course the other is a fluctuating thing—it is impossible to say; the tenants leave it down as they like.

Labour.

14,318. Is less labour employed upon your estate?—Yes, I think there is less labour employed. I have got here if you like to have it (it is made out by one of my tenants) the labour cost on a large farm on the Wolds at three different periods, 1851, 1878, and 1894.

14,319. What are the figures?—It is not per acre, but it gives the prices paid (*handing in return*). That is made out by a man who keeps very accurate accounts; it shows the fluctuation in the rate of labour.

14,320. Apparently the day labourers were paid in 1851, 1*s.* 8*d.* per day; in 1878, 3*s.*; and in 1894, 2*s.* 3*d.*?—Yes, that is so.

14,321. Therefore there has been a reduction during the last 10 or 11 years, but in 1878 they had risen very considerably?—Yes, they had and for the last five or six years previous to 1878.

14,322. Apparently on this farm the same number of hands were employed as before?—I suppose so; about the same number. I might have got out per acre how it came out, but I have not.

14,323. The turnip hoeing apparently in 1851 was 3*s.* 6*d.*—done by piece-work, I suppose?—Yes, those are the rates for piece-work.

14,324. In 1851 it was 3*s.* 6*d.*, in 1878 it had risen to 5*s.*, and in 1894 it had come down to 4*s.*?—Yes.

Mr. E. Turnor.
30 Mar. 1894.

14,325. And corn weeding 1*s.* 6*d.* in 1851, 2*s.* 6*d.* to 4*s.* in 1878, and 1*s.* 6*d.* to 3*s.* in 1874?—Yes.

14,326. Therefore there has been a considerable reduction within the last few years?—Yes.

14,327. But not to the point to which it was in 1851?—Not to that point at which it was in 1851.

The season of 1893.

14,328. I suppose that the year 1893, last year, was one of the worst years you have ever had?—It was, I think, the worst since 1886 since I have been farming, and have had the management myself; the yield was so bad.

14,329. That was on account of the drought?—On account of the drought. I have here some figures relating to one of my own farms, the best barley farm; I have got worked out the yield per acre for five years, and 1893 comes out much the worst; the money yield is 5*l.* per acre, and before it has been over 7*l.* That was entirely owing to the drought not to price; the price was about the same.

Price of barley.

14,330. Apparently the price had rather improved?—It varies; the average price was 34*s.* 1*d.* in the first year I have taken, and the same last year.

14,331. In 1889 it was 34*s.* 1*d.*, in 1890 35*s.* 4*d.*, in 1891 32*s.* 11*d.*, in 1892 31*s.* 10*d.*, and in 1893 34*s.* 1*d.*?—Yes.

14,332. Therefore the price was distinctly better than in 1892 and 1891, but the yield per acre fell from 6*l.* 19*s.* 2*d.* in 1891 and 7*l.* 8*s.* 6*d.* in 1892, to 5*l.* in 1893?—Yes.

14,333. Therefore, 1893 was an exceptional year?—It was the worst year certainly.

14,334. Due to the badness of the yield?—Yes; and that is a farm which grows the best quality of barley for the Burton brewers.

Results of farming.

14,335. Apart from the year 1893, should you say that with the reduction of rents that have been effected, the farmers can hold their own?—The five years I have had that farm it has paid me the rent and the interest on the capital, and that is one of the farms I have now let.

14,336. Then you worked this farm which was in your own hands for five years?—Yes, without any loss at all.

14,337. Without a loss?—Yes.

14,338. Making interest upon your capital?—Yes.

14,339. And rent?—Yes.

14,340. What rent did you pay yourself?—I put it at the same rent as the old tenant, about 16*s.* I think it was.

14,341. 16*s.* an acre?—Yes.

14,342. What interest did you credit yourself with on your capital?—3½ per cent.

14,343. 3½ per cent.?—That is what I paid.

14,344. Beyond that did you make any profit?—Very slight I think. The only reason that farm did not let is because it was very steep, some of it—steep hillsides. It is rather a difficult farm to work with horses, and there is not much grass.

14,345. 3½ per cent. on the capital would hardly be enough for a farmer, I suppose?—I daresay not, but still it repaid me what I paid for it. I only paid 3½ per cent.

14,346. Did you employ a bailiff on it?—Yes, a foreman.

Prospects of farming.

14,347. Then I would ask you again, apart from the exceptional year of 1893, should you say that with the reduction of rent and with the reduction of wages, and, I suppose, some reduction of rates due to the lower assessments, that the farmers in your district could hold their own?—With 1892 and 1893 excepted you may. 1892 was a bad year generally speaking (except on that farm), on account of the cold, wet summer and the bad wheat harvest. There was a great deal of corn out almost in November which was worthless. But previously to 1892 I think they got on fairly well. Then, of course, the price of wheat has decreased.

14,348. You have had two exceptional years in succession?—Yes, we have had two bad seasons.

14,349. One due to a wet season and the other due to drought?—Yes.

Mr. E. Turnor.
30 Mar. 1894.

14,350. Therefore the net result was very unfavourable?—Yes.

14,351. You may say, I presume, that the prices did not rise in proportion to the deficiency of the two harvests?—No.

14,352. That, in fact, is what the farmers have got to meet, the possibility of bad years without a rise in price?—Yes, then the last two years not only the price of wheat, but the price of stock has diminished so very much. That is a good deal owing to the drought, and also to the quantities of foreign meat coming in, I think.

14,353. But largely due to drought; I presume there was no food for the cattle, or rather less food for the cattle, and they were thrown upon the market?—Yes, I have got the average price of hoggets, which are the yearling sheep in the great market at Lincoln April fair. From 1877 to 1893 it works out at 57*s*. 6*d*., and the lowest year was 1893, 45*s*. 7*d*.; that shows a reduction of 12*s*. and in cattle the reduction was almost larger.

14,354. That reduction, I suppose, was only mainly in the last year?—That was in the last year, and it still continues. They have not gone up to the present moment, but that is a good deal owing to the drought and partly also to the increased quantity coming in, I think.

14,355. Have the farmers generally got the benefit of the reduction of their rents in the reduced assessments?—Yes, I think they have taken care of that.

Rates.

14,356. Have the rates in the £ been increased or not?—In some places they have. In South Lincolnshire they have been increased.

14,357. In your own district?—They have increased about 1*s*. in the £; but I live in north Lincolnshire, and there they have not, they are about the same as they were. I think since the county council came into operation in some places they have increased.

14,358. What do the rates average, taking all the rates together, how much in the £?—Perhaps half-a crown to 3*s*. Of course, each parish varies.

14,359. Then if there has been no increase in the £, and if they have had a reduced assessment owing to the falling rents, the tenants have got a substantial relief in that direction?—Yes.

14,360. If they got their assessments reduced in proportion to their rent?—Yes, but the rates increase, and very often it is nearly as broad as it is long.

14,361. You have just told us that in north Lincolnshire the rate in the pound has not increased?—It has not increased there so much, but in south Lincolnshire, where I pay rates in the parish, it has increased something like a shilling.

14,362. Is that an exception, or is that a rule, do you think?—There are two different county councils, and it is different altogether.

14,363. One county council has been more economical than the other?—One county council spends more money than the other; I believe that is it.

Condition of labourers.

14,364. Now as regards the condition of the labourers, what have you to observe upon that?—I do not think that their condition has deteriorated at all. The employment may become more irregular, but of course they get a great advantage in the low price of food, bread and meat. In winter I daresay there may be more unemployed.

14,365. But on the whole, should you say there is no deterioration?—I do not think there is.

14,366. Has the low price of food made up, do you think, for the lower rate of wages?—I should think it had very nearly.

14,367. Are there any empty cottages on your estate?—None on mine; there are some here and there in Lincolnshire in the large open villages where the cottages belong to small owners and are high rented. I know three or four villages where there are empty cottages.

Uncultivated land.

14,368. Has any land gone out of cultivation in your district?—I think not. There were some two or three farms four or five years back. I do not know of any in Lincolnshire that you can say are out of cultivation at the present moment. One of these cases was a case of disputed ownership, and I think there were reasons for it in each case.

14,369. Have farms been subdivided at all?—Not much.

Mr. E. Turnor.
30 Mar. 1894.

14,370. You told us just now that there is a demand for small farms?—Yes.

Subdivision of farms.

14,371. Has that been met at all by cutting up or reducing the acreage of large farms?—Not much, I think. There is a standing difficulty in the way—the money to find for the building of the houses, and unfortunately during the last 40 or 50 years up to when the depression set in the tendency in Lincolnshire has been to throw all the farms together.

14,372. That was the tendency up to that time?—Yes, up to about 20 years ago.

14,373. That, you think, has been a misfortune?—As things are now it is. Of course when times were prosperous I daresay it may have been an advantage.

14,374. But lately the smaller farms have done better than the larger ones?—They are much easier to let. There are more people with sufficient capital to take a farm of 200 acres than a farm of 500.

The currency.

14,375. Now what do you suggest as a remedy?—I am in favour of bi-metallism. I think that the low price of silver acts as a premium on Indian wheat, but I do not think it would do any good unless you have some international agreement. One country doing it is no use at all.

14,376. We may take it that you consider the fall in price has been due to the appreciation of gold?—Yes.

14,377. And you think that that might be met by some provision in the direction of bi-metallism?—Yes.

Rates.

14,378. Then what further do you recommend?—Local rates should not be increased. The tendency of the present day no doubt is to increase them with all the different bodies levying rates. They ought to be reduced if possible.

The marking of foreign meat.

14,379. Then what further?—Then there is the marking of foreign meat. Foreign meat certainly does not compete against our best meat but it competes against the inferior varieties, and as it is now it is very difficult to tell which is which.

14,380. Do you think that it is possible that the consumers may appreciate New Zealand meat as much as the inferior English meat?—As it is now they cannot tell one from the other. It competes against the best class of meat now, simply because you cannot distinguish in the butcher's shop which is which.

Malt tax.

14,381. Then on the subject of the malt tax what have you to say?—I think that the substitution of the beer duty for the malt tax is a very great mistake. Certainly all the substitutes for malt—sugar and so on—have increased very much.

14,382. I think you must have been in Parliament when the agitations for the repeal of the malt tax took place?—I do not remember. I do not think I was. I forget what year it was in. No doubt it was a mistake.

14,383. You think what was done was a mistake?—It is a mistake now and every year shows it more clearly. It is more the inferior barleys that it tells against; the best barley goes to Burton and the Burton brewers buy it and it does not tell so much against that but certainly it has depressed the price of the second class barley.

14,384. I think you said your district grows the best quality of barley?—Yes, in part; that farm does and the district round Grantham does, and, of course, all the Lincoln heath does.

Price of barley.

14,385. Taking 15 or 20 years ago has the price of the best quality of barley been maintained?—I think it has diminished; it used to be at 40*s*.

14,386. It used to be at 40*s*.?—Yes, I should think you might take an average at 40*s*. 20 years ago for the best barley.

14,387. Now it has come down to 34*s*. apparently?—Yes, 34*s*., and sometimes less.

State loans.

14,388. Then do you think anything can be done for landowners by the Government lending money for improvements?—I do not see why the Irish peasants should have Government loans and not the English landowners—they want help almost as much now. With these reduced rentals it is impossible to execute any improvements in the way of new buildings or anything.

14,389. If loans were made on easy terms would it be possible to reduce the size of the farms in order to meet

Mr. E. Turnor. 30 Mar. 1894.

the demand?—You might do that, and that is what I had in view.

14,390. Have you borrowed any money yourself through the improvement companies?—Yes, I have. I have got something like 2,000*l.* a year running now in improvement rentcharges—terminable charges.

14,391. What average interest do you have to pay including repayment?—I think it is about 6*l.* 10s. from these improvement companies who have offices in this street.

14,392. Have you calculated what it might be if the loans were made by the Government?—I think the Irish loans were something like under 4 per cent.

14,393. Including the repayment?—Including the repayment over a term of years.

14,394. But I think those were for the purchase of their holdings where the repayment would be spread over a much longer term than would be possible for effecting improvements?—I do not know what the terms of the Irish loans are, what term of years it is, but most of the drainage and building loans are repayable within 25 years.

14,395. Of course it makes a great difference in the annual charge what the term of repayment is?—Yes, it does.

14,396. What in your opinion should be the term of repayment?—I think buildings you might well extend to 30 or 40 years; of course they continue good. But drainage does not; no doubt the life of drainage does not last above 25 years.

14,397. Is there much room for further drainage in your district?—There is always a certain amount that gives out every year, and wants renewing.

Value of land in Lincolnshire.

14,398. Have you anything else to suggest?—I have got a statement here showing the depreciated selling value of land in Lincolnshire—a certain number of cases in recent years which one of the leading solicitors gave me.

14,399. Will you state what they are?—Practically you may say the land market is dead in Lincolnshire now; you cannot sell any large estate. Those are all small ones.

14,400. The large estates are unsaleable, and apparently from those lists for the smaller estates the value of land has gone down 50 per cent.?—Yes, there is a certain demand for accommodation land and grass land; you can sell that in small lots.

14,401. Not quite 50 per cent.; I should say, looking roughly at it it is from 40 to 50 per cent.?—I have not worked it out at all. Those were only given me a day or two ago.

Leases and yearly agreements.

14,402. (*Mr. Whitehead.*) Do your tenants hold under a lease or under an agreement generally?—I have got an agreement with me here if you would like to see one. They are all yearly agreements with six months' notice.

14,403. Do you find that they object to leases?—I have never been asked for one. I think in Lincolnshire there is a strong feeling against leases, especially in the present time; they do not like to tie themselves for 14 or 21 years.

14,404. That applies to the whole of Lincolnshire?—That would apply to all Lincolnshire.

The Agricultural Holdings Act and the Lincolnshire custom.

14,405. Do you adopt the Agricultural Holdings Act with respect to your tenants?—No; in that agreement there is full compensation for tenant right and improvements.

14,406. Is the Agricultural Holdings Act adopted generally in your part of Lincolnshire?—There are very few estates under the Agricultural Holdings Act. We have got a custom in Lincolnshire which we consider quite as good as the Agricultural Holdings Act.

14,407. And your tenants consider that equally good?—Yes, and they pretty nearly all of them prefer a six months' notice instead of 12. I think I have only got one farm on 12 months' notice.

Compensation for land laid down to grass.

14,408. How do you assess the compensation with regard to grass land laid down by your tenants?—We do not have that. I have always given the seed myself and very often the manure at the end of three or four years to put on it.

14,409. Is the compensation for that provided for by the Lincolnshire custom?—No, I do not think it is. It is only in recent years that it has arisen.

Mr. E. Turnor. 30 Mar. 1894.

14,410. What would be the process then in case of compensation being necessary?—I suppose it would work out in this way, the tenant might plough up the grass as if he was going; he would come to you and say, "I will plough this up unless you give me compensation;" so it would be a question for agreement then. He would have power, under the custom and the agreement, to plough it up, so in that way he would get compensation.

Free sale.

14,411. Does your agreement allow sales of hay and straw?—No, it does not; but in one or two cases I have allowed the sale of straw. I have not got a strong opinion against it, provided the farm is properly managed, and the supply of artificial manure is sufficient. I do not see why they should not sell straw, but I have hardly ever been asked, none of them wish to sell it.

System of cultivation.

14,412-3. Might I ask what the principal cultivation is on your estate?—The soil varies; there is every description; sand and clay, a little fen land, and chalk and limestone. It is arable chiefly; I should say three-fourths of it is arable. I have no very large amount of grass and no very good grass.

Results of farming.

14,414. You told us that on one of your farms you had made a small profit and you had paid yourself the rent?—Yes.

14,415. Would that apply to all the land you have in hand?—No, certainly not, not the clay land. That was a turnip and barley farm.

14,416. What would be the state with regard to that?—On the rest of it if I can make the interest on my capital that is about all I can do now.

14,417. Without charging any rent?—Yes, with but little rent. I just keep it going in a good state without loss except the rent.

14,418. Would your estate consist chiefly of the heavy clay land or of the other land?—I hardly can tell you the proportion of the two, but I should think the clay land is the smaller half of it. I have a good deal of clay land.

14,419. Have your tenants, do you think, made a profit upon that clay land?—Of course it is all mixed up together, and there are very few purely clay farms except one or two that I have got in my own hands. The soil varies very much in the same farm.

14,420. But as a rule it seems that your tenantry have done well, because there have been few changes, and your rents are paid fairly well?—Yes, on the whole. There is always a certain amount of arrears which there used not to be, 20 or 25 years ago an arrear was unknown, but now there is always some every rent day.

Ground game.

14,421. With regard to rabbits, do you make any reservation?—They kill their own rabbits.

14,422. Yesterday we had evidence that in some agreements tenants were prohibited from killing rabbits under penalty of so much a rabbit?—That would be useless now under the Ground Game Act.

14,423. I know, but still it figured in an agreement. Do you know of any case of that sort in your district?—No, I do not think I do. They kill their own.

Results of farming.

14,424. (*Mr. Clay.*) The land you have in your own occupation would seem to be about 4,000 acres?—Yes, it is. That includes the park, and it is really about 3,600 that I am farming without the park and the home farm.

14,425. Have you drawn up a balance-sheet of profit and loss on those farms?—I do work it out every year I keep it in different accounts. I have five farm accounts all kept separate.

14,426. What is the general average of the percentage you are getting for profit?—I am afraid there is no profit to be made now in these days. That which I mentioned is the only farm which has paid the rent and the interest. That is a turnip and barley farm.

14,427. And the other farms are not paying interest?—They have paid the interest, but little rent. I think, taking the eight years one with another—the eight years since I have managed it—that is what I reckon they have done.

14,428. They have paid little rent, you say?—Little rent, but they have paid the interest on the capital, 3½ per cent. That is what I pay myself, so I do not charge myself any more.

14,429. Do you consider a tenant taking that farm and farming it would make ends meet at 3½ per cent.?

Mr. E. Turnor. 30 Mar. 1894.

—I suppose not: I suppose they would want more than that, but still 3½ per cent. is about as much as one can get now for any investment, I think. It is very difficult to get more.

14,430. There is more than the money invested in the farm—there is labour to be allowed for—so much per cent. for labour, for farmer's superintendence?—Yes, but I have not reckoned that in. Of course it includes the bailiff and everything of that sort.

14,431. But for a farmer's marketing and experience what per cent do you think that he should have over and above the general 3½ per cent.?—Of course that would be a separate thing; you can put that down that it comes into the profit.

14,432. May I ask you what that would leave as profit?—As far as I have worked it out there is nothing left for profit beyond paying the interest on the capital. I have only looked at it from that point of view myself, not from a tenant's point of view.

14,433. But is the tenant's point of view not a very important view in the matter?—It is, no doubt, from their point of view, but in the land which I have had myself I thought it was hardly necessary; as long as it paid the rent and the interest I was quite satisfied.

14,434. Do you not think in that condition of things you are as a landlord called to give a further reduction of rent to enable the tenant to have something gathered up for old age at all events?—Certainly they ought to have something in the land that is let beyond their interest and the rent.

Reduction of rent.

14,435. May I ask have you reduced your tenants' rents of late?—Yes, I have reduced them roughly speaking on the whole estate about 35 per cent. and then for two years, beginning Michaelmas 1892 and Lady Day 1893, in addition to that I returned 10 per cent., and the last half year I have returned 15—in addition to the 35 per cent. Of course it varies very much. Some farms work out over 50 per cent. reduction and others are less.

14,436. But if you are only making 3½ per cent. of profit do you know if your tenants are making any more?—Some might be doing better. Of course all the farms I have got on hand are the worst farms on the estate. The best are let.

14,437. Do you not think under those circumstances that you should make a further reduction to enable your tenants to have what they call now a living wage?—I think they do live, except these last two years; most of them have paid their rent before except a certain amount of arrears every year.

14,438. Have you given a special reduction for the last two years?—I have given a special reduction for the last two years.

14,439. Of 15 per cent.?—10 per cent. for two half years and 15 the last half year.

The Agricultural Holdings Act and the Lincolnshire custom.

14,440. Regarding the Agricultural Holdings Act you say you have a Lincolnshire custom that works quite as well as the Agricultural Holdings Act?—Yes, they always prefer in Lincolnshire to go under the custom instead of under the Agricultural Holdings Act.

14,441. I see by your agreement you give seven years only for lime?—Yes.

Compensation for limeing.

14,442. Do you consider that is sufficient?—Some people give ten, I think—perhaps ten might be better, but there is very little limeing done; in fact, I generally give the lime myself of recent years—there is hardly any done by the tenant.

14,443. So you must have thought even ten years is not sufficient for the tenant to get his compensation out?—I think seven is about the usual thing in Lincolnshire.

14,444. Do you consider you can take the whole of the compensation for the lime out in two rotations of a five-course rotation?—I think so. I do not think it lasts much beyond.

14,445. Have you not an experience of it lasting more?—I have not done very much limeing myself.

14,446. So you have not any experience?—We lay the worst clay land down in grass and then it does not want limeing.

14,447. Are you troubled at all with finger and toe turnips in Lincolnshire?—On some farms, but not very much. On Sandy land I have found that gas lime is the best remedy for that.

14,448. How long do you consider gas lime lasts?—Only one or two years, I think. You must put it on in a very small quantity. It is very dangerous stuff to deal with, and you have to be very careful with it.

Mr. E. Turnor. 30 Mar. 1894.

14,449. What quantity per acre?—I hardly can tell you that, but you must only just put it in with the drill; I do not sow it broadcast, but just use it instead of ashes.

14,450. What price do you pay for gas lime, may I ask you?—I have not bought any very lately, but it is only a low price, I hardly can answer the question. It is four or five years since I have had any.

Malt tax.

14,451. You say that the abolition of the malt tax had lowered the price of second class barley; is it not the case that it lowered the price of the good class barley more than the second?—It has lowered the second; I daresay it may have lowered the best class 5*s.* a quarter, but the second class barley that is grown on the clay land, and inferior land, it has lowered much more; you cannot get more than about 24*s.* or 25*s.* now for it.

14,452. Is it not within your memory that the farmers themselves of Lincolnshire were the principal advocates of the abolition of the malt tax?—I daresay they were but I should think most of them see their mistake undoubtedly.

14,453. And they have found it out; would they like to return to the malt tax again?—I think they would certainly.

Effect of the fall in prices.

14,454. (*Mr. Chaplin.*) With regard to those farms which you have in hand and which you say are just able to pay interest and no more on your capital, I suppose that if there was any further fall in prices they would not even be able to do that?—No, I do not think they will do that this year with the bad year we have had, but I have not made out the accounts for this year—not for 1893 terminating this Lady Day.

14,455. Then if there was to be any further appreciation of gold to which I understand you attribute the fall in prices, land in Lincolnshire would begin to go out of cultivation unless it was farmed at a loss?—Yes, it would.

Land in hand.

14,456. With regard to these farms in hand, which I understood you to tell Mr. Clay were some of the worst farms on the estate you took them I presume because you could not let them satisfactorily?—Yes, one or two that I have taken were left in a very bad state, and I have really not tried very much to let them. When I succeeded to the estate I think there were over 2,000 acres then in hand and I went on with it, so that really I have not made any very great attempt to let part of it.

14,457. They were left in very bad condition?—Some were left in a bad state. I have just taken a farm now which I have not tried to let; in 3 or 4 years I hope to get it round and then to let it.

14,458. I suppose if you attempted to let it in its present condition, you would be compelled to take hardly any rent at all?—Yes, I daresay, very likely, but it is naturally a good farm.

14,459. Has that been your experience recently in the case of farms that have been given up, that they have been often in a very bad condition?—Yes, some have been, not all. That farm to which that paper there refers was handed over to me in a very good state.

14,460. What were the circumstances under which that was handed over to you?—The last tenant had it, and grew a lot on it, and he said he could not make it pay. I have certainly managed to make it pay the rent and the interest on the capital. It was a hillside farm, and if there is anything against a farm now they will not take it.

14,461. I understand it was in good condition while he farmed it?—Yes, it was in very fair condition.

14,462. And he handed it over in good condition?—Yes.

14,463. And notwithstanding that, he could not make it pay?—So he said, but he got very old, and I think that had a good deal to do with it; he retired altogether.

Reduction in rent.

14,464. The reductions upon that class of farm I understand you to say, including the recent temporary remissions that you have made, amount to 55 per cent.?—The 15 per cent. would be in addition to the 35 per cent.

14,465. Then it amounts to 50 per cent.?—Yes, that is taking the average of the whole estate, not the large

Mr. E. Turnor.

30 Mar. 1894.

farms; the large farms alone would come out to something like 10 per cent. more.

14,466. The reductions on the large farms would come to something like 50 per cent. ?—They would with the 15 per cent.

14,467. Now with reference to the question put to you by Mr. Clay, that if the tenants were not making more than 3½ per cent. interest on their money should you, under those circumstances, make a further reduction. I assume that if the tenants were not making more than 3½ per cent. they would ask at once for a reduction ?—I do not think they would be backward at all in asking for a reduction, I have found that.

14,468. In that case supposing you refused a reduction, I presume they would give up the farm ?—Yes, very likely.

14,469. And you would be in the same position that you are with regard to those that you have in hand already ?—Yes.

14,470. Then I infer, if that is the case, that their position is not yet reduced to yours, that they can only just make 3½ per cent. interest ?—No, I suppose probably some of them make more.

14,471. The reason being, I understand, that the farms that they still retain are superior in character to those you have in hand ?—They are better of course, most of them, than what I have got myself.

14,472. (*Chairman.*) You have had the disadvantage of having to bring up the farm again to a good condition when it was thrown upon your hands ?—Some of them, yes.

14,473. (*Mr. Chaplin.*) And also, I understand, they are naturally not so good ?—That is so.

Labour.

14,474. Now one of the effects of the depression, I think you said, was that less labour was employed ?—Yes, I think there is on the whole.

14,475. Have the wages of the agricultural labourer fallen ?—They have. I put in a paper showing the wages paid on two large farms in the Wolds—one of my tenants gave it to me. It shows three different periods.

14,476. As far as labour is concerned the effect of the depression in Lincolnshire has been this: that there is less employment for the labourers and more difficulty in obtaining it, and wherever they obtain it it is at considerably less wages ?—Compared with 1878 it is, but not compared with 1851.

14,477. Compared with the middle period, for I observe that your table is divided into three periods ?—Yes, I think my own labour has increased a little bit since 1887 and 1894. I have the rates per acre here worked out on my farm.

14,478. (*Chairman.*) Taking this table that you have laid before us, it would seem that the labour wages have been reduced 20 per cent. since 1878 ?—Yes, it went down to 2*s.* one time, and then it has gone up again a little.

14,479. It is very much above the price at which it had been in 1851 ?—Yes.

Large and small farms compared.

14,480. (*Mr. Chaplin.*) With regard to the relative prosperity of the large and the small farms, what is the nature of large farms when there is a man in possession with plenty of capital still left, and able to do justice to the farm; are they in a worse condition, do you think, than the men holding 200 acres or not ?—We find instances of both almost; I do not know whether you can draw any general conclusion about that. Some are doing well; in fact I could produce two or three farmers—not my own tenants—I know one man especially, who would say this last year in Lincolnshire was one of the best years he has had.

14,481. How did he account for that ?—It is a very good farm, and he has sold a good deal of his straw: it is his own land; and he made a very high profit on it.

14,482. And he had some good barley, I suppose ?—Yes, very good barley, and it averaged 36*s.*

14,483. (*Chairman.*) Do you know what he sold his straw for ?—I think he sold some at 3*l.* 5*s.*; that is what he told me he got for oat straw, and wheat straw is about 4*l.*

14,484. (*Mr. Chaplin.*) Whereabouts is that farm situated; is it anywhere near a town, or has he had to transport his stuff ?—No, it is down near the fens.

14,485. It grows very heavy crops of straw ?—It grows heavy crops of straw.

Mr. E. Turnor.

30 Mar. 1894.

14,486. (*Chairman.*) How much would he grow to the acre ?—I think he told me that he sold two tons of oat straw off one field.

14,487. Per acre ?—Per acre, and made about 6*l.* 10*s.*

14,488. (*Mr. Lambert.*) That is a very exceptional crop ?—Yes, it is. Of course you must not take that as a test, only I mention it to show that even in a bad year like last, under exceptional circumstances a man has done well. I know of one or two cases of that sort, but you must not take them as a test at all.

14,489. (*Chairman.*) Then straw seems to be an exception to the rule of other agricultural produce; if there is scarcity it does rise in price; that would naturally arise from the difficulty of importing it ?—It has risen now.

14,490. (*Mr. Chaplin.*) I suppose that the reason for trying to restore small farms in a greater number is entirely due to the fact that it is so much easier to find tenants for them ?—It is; it is much easier to find men with a small capital than with a large capital.

Fall in prices.

14,491. Now, but for the great fall which has occurred in prices, is there anything within your knowledge to render agriculture at the present time less prosperous than it was in former days ?—Apart from the fall in prices ?

14,492. Apart from the fall in prices ?—No, I do not think there is. What has rendered the depression more acute the last two years has been the bad seasons of 1892 and 1893.

Changes in system of cultivation.

14,493. I know that you are a practical agriculturist; is there anything to be done in your opinion in a county for instance, like Lincolnshire, by changing the character of the cultivation in any way ?—I do not think there is much; you must agree it has changed to a certain extent, and of course there is a very large proportion of land that used to be sown with wheat which comes in for other crops now—oats and barley. In fact, I myself, have given up growing wheat except for the straw, but otherwise there is a good deal of land laid down in grass, though really that does not pay very much.

14,494. With the exception of a rise in prices is there anything that you can suggest from your practical knowledge that would be beneficial to agriculture ?—Nothing except what I have mentioned here; I think the substitution of a malt tax for the beer duty would help the barley land a great deal.

Malt tax.

Duty on barley.

14,495. A good many witnesses have suggested to us before this Commission that they would like to see part of the duty which is at present raised upon beer remitted, and an equivalent revenue raised by the imposition of a duty upon foreign barley; would that meet with your approval ?—I do not believe very much in putting duties upon foreign corn. I do not know whether it is practicable.

14,496. Assuming that it is practicable, do you think that it would be of any benefit to agriculture or to any portion of the agricultural interest ?—It might help the inferior barleys a bit, now that they brew from all kinds of barley. Russian barley costs 16*s.* or 18*s.* a quarter; and I believe a good deal of that has been used this last year.

14,497. Other witnessess have replied to a similar question that some classes of agriculturists would be injured by it because foreign barley is used now considerably for feeding ?—Yes; of course it would tell against them in that respect. I found it answer to sell my barley at 25*s.* this year and buy the Russian barley at about 18*s.*

14,498. What I want rather to arrive at is whether you have formed any opinion as to which side the balance of advantage lay on ?—I should rather say that it would lay against it perhaps.

14,499. It would lay against it; that is your view ?—Yes; I would sooner have the cheap foreign barley for feeding stock.

Cattle disease.

14,500. Have you ever considered the question of the Contagious Diseases (Animals) Acts, and whether anything further should be done in that direction ?—Lincolnshire now, I may say, is practically free from disease except swine fever, and I do not think there is anything more to be done if we go on as we are.

Mr. E. Turnor.
30 Mar. 1894.

14,501. Any return of these diseases I suppose you would regard with the greatest possible apprehension?—Of course I should.

Slaughter of foreign cattle.

14,502. Many witnesses have suggested that in order to ensure us against any re-introduction of that disease, the time has come when the orders for the slaughter of all animals at the port should be made obligatory?—I certainly should be in favour of that I think; in Lincolnshire we do not want any store cattle.

14,503. Would you go so far as to say this, then: that you approve of the view that animals should no longer be permitted under any circumstances to be sent into the interior of the country except for special purposes?—I certainly should like to see all cattle slaughtered at the port of entry. I think Lincolnshire practically breeds its own cattle; we do not import many.

Leases and yearly agreements.

14,504. I think you told us that your farms were all held on agreements based upon the custom of the county?—Yes.

14,505. And that the tenant farmers, as a rule, in Lincolnshire were entirely opposed to leases?—Yes, certainly. I have never once been asked for a lease.

14,506. That is not only the case at the present time, but I think I am right in saying, am I not, that it has always been the case?—It always has been the case, in Lincolnshire they prefer an annual agreement to a lease.

14,507. The reason for that, I think was two-fold, was it not; namely, that under the custom of the county they thought they had an equal or a better security than was given to them under a lease; and that at the same time they were encouraged to continue the high cultivation of the farm until the last moment?—Yes, I think that is the case.

14,508. In any of those changes of tenancy that you have had recently have you had any demands or applications for a modification of your agreements?—No, not at all.

14,509. Or for any changes in them?—No. My usual practice when anybody comes to enquire about a farm is that I give him a blank copy of the agreement, and ask him to take it home with him and read it over at his leisure. I do not think I have ever had anybody ask for a modification.

14,510. You have had very considerable changes in the rents of course?—In the rents of course, but not in the agreements.

14,511. In the terms of the agreements you have had no applications for changes at all?—No. That agreement has been in force upon the estate for, I think, 40 years or more. There may have been one or two slight modifications.

14,512. And that, I understand, is the case although they have every opportunity of studying the agreement or of coming to make applications for changes in it if they desire to do so?—Yes.

Land in hand.

14,513. (*Mr. Dalton.*) In the profit and loss accounts of the farms that you have in hand, how do you deal with the expenses of the bailiff?—It all goes into the labour.

14,514. What are his wages usually?—They vary, I think, from 60*l.* to 70*l.* I am only telling you from memory; I may not be quite right.

14,515. The farmer would save that if he had the farm?—He would save that certainly, although some of them keep a foreman.

14,516. The farmer would also get his residence on the farm?—He would get his residence and there is a certain advantage in keeping his establishment in what a man gets off his farm.

14,517. Therefore it would not be fair to suppose that he would only in those very bad farms that you have taken, get the 3½ per cent?—No; he would get other advantages.

14,518. He would get those two advantages?—He would get his house rent free, and he would get milk and poultry or whatever produce he chose to consume.

Price of straw.

14,519. Can you form any estimate to what extent the rise in the price of straw has compensated for the fall in the price of corn?—I think that you may take it that the rise in the price of straw is very exceptional it is only this year in consequence of the drought. I do not think you can draw any general deduction from that; next year it may vanish again.

14,520. But if so much less wheat is grown in the country do you not get less straw? Does not that send up the value of straw necessarily?—Yes, there is always in normal years a good deal of wheat straw going from the fen district of Lincolnshire into the towns now.

Mr. E. Turnor.
30 Mar. 1894.

Rates.

14,521. You think one of the remedies should be a reduction in the local rates?—Yes, certainly.

14,522. How do you propose to bring that about?—There ought to be more of the local expenses thrown upon the Imperial taxation.

14,523. Do you think that does reduce the rates always or does it conduce to extravagance in any way?—I do not think it conduces to extravagance. Take, for instance, those rates that we have in aid of the police which have been going on for some years.

14,524. You think that the difference in the rates between north Lincolnshire and south Lincolnshire is owing to the fact that in the one case you have a county council that spends more than the other?—I think so; that is my experience, but I have not worked the thing thoroughly out.

14,525. You have not seen how much the difference in the county rate is between the two?—No. It comes to me in this form; the county rate is levied in the poor rate and on these farms you cannot very well deduct the county rate, it is all paid together.

Slaughter of foreign cattle.

14,526. (*Mr. Lambert.*) You expressed an opinion that you were in favour of the slaughter of animals at the port of debarkation; for what reason do you favour that slaughter?—I think it would keep out foreign diseases.

14,527. And is that the only reason?—Yes.

14,528. So that presuming foreign countries were free from disease you would not advocate such a measure?—No; but then it is very difficult to know that they are free. Recently we have had several cases on the continent of Europe; it is very hard to say when a country is free from disease.

14,529 Presuming they were free?—If it is possible, yes.

Tenants' capital.

14,530. Have the tenants lost a good deal of capital in your district?—I have no doubt they have in Lincolnshire. I am afraid there is no doubt about that.

14,531. Can you give any estimate as to what proportion of capital the tenants have lost?—I have never gone into that question really.

Arrears of rent.

14,532. I see that your arrears in 1878 amounted upon the gross rentals to something like 4 per cent., but 25 years ago you said you had none?—There were practically none; there may occasionally have been a small one. In 1878 they were just beginning to feel the bad times.

14,533. In 1888 they amounted to about 13 per cent.?—Yes.

14,534. And in 1893 they were about 11 per cent.?—Yes.

14,535. Why is it that in 1888 the arrears should have increased?—My practice is not to keep them on the books for a very long time, I write them off. That may have been the reason. More may have been written off then. If I think they are utterly irrecoverable I write them off.

14,536. Then I suppose arrears of rent would mean, in some degree at all events, too much rent being charged?—No, I do not know that it would; there are other reasons: some men farm much better than others; some men always get into a chronic state of arrears of rent and others do not. On some farms you never have any arrears.

Condition of agriculture.

14,537. You said this last year 1893 was the worst year you have had; what was the state of agriculture say five years prior to 1893?—It has been going down hill no doubt more or less every year; but then the bad seasons of the last two years, 1892 and 1893, have made it much worse.

Reduction in rent.

14,538. As compared with 1888 were there many reductions in rent up to 1891?—Yes, there were; the reductions began in 1878 and they have been reduced ever since.

14,539. I know; take the period 1888–1891, were there many reductions in that period of three years?—From 1888 to 1891 they are not wholesale, but some farms were reduced. I have always tried to keep all the farms on the estate about level, so that they have no reason to complain, particularly in the case of a new letting.

Mr. E. Turnor. 30 Mar. 1894.

15,540. Have you had many changes upon your estate?—I have had these changes since 1886. I have had 5,427 acres left, and out of that I have let 4,277 acres.

14,541. Do you find that where newly let, the new tenants require a larger reduction of rent than the old tenants required?—No, I do not think so.

14,542. You said that the Lincolnshire system of tenant right encouraged high cultivation?—Yes.

Condition of farms at end of tenancy.

14,543. How do you reconcile that with the fact that when the farms are given up to your hands, they are in an impoverished condition?—Of course you may have a very good system on paper, and they do not carry it out; a man, if his capital diminishes, or for any other reason, if he takes to drink, or anything of that sort, lets his farm go to the bad.

14,544. Were all those farms that you had given up to you in an impoverished condition?—No, not all of them, I will not say that all were.

14,545. Would it be possible to frame a system of tenant right whereby it would pay a man quite as well to leave his farm in a high state of cultivation as in an impoverished condition?—We think we have got that system; but of course, as I say, you may have the best system on paper, but you cannot make every individual carry it out; that depends very much upon the tenant of each farm.

Length of notice to quit.

14,546. I see in your agreement that you stipulate that six months' notice shall be the length of notice to quit?—Yes.

14,547. Are the tenants generally in favour of that?—They are. When the Agricultural Holdings Act of 1883 came into force I asked them all, and there was only one man who wanted 12 months, and that was for a special reason. He sold milk. We gave him 12 months. The six months' notice is almost universal in Lincolnshire, I think.

14,548. Can it possibly conduce to high cultivation, that a man is liable to be disturbed at six months' notice?—I do not think it matters at all as to whether it is six months or 12; the only advantage of 12 months is that perhaps a man may have a whole year to take a little more out of the farm.

14,549. To recover what he put in possibly?—I do not think as to the cultivation whether it is six months or 12 months matters at all.

14,550. I am thinking of fairness to the tenant; do you think it is fair to the tenant, that the landlord should have the right of evicting him in six months without any previous notice?—It is the universal custom almost in Lincolnshire.

14,551. Is the custom based upon the tenant farmers' wishes?—Yes, I think so. If they wish to have 12 months, I should not at all object to their having it. In fact in the only case, as I have told you, where the man did ask for it, he got it. I do not think it is a material point between six and 12 months.

Size of farms.

14,552. What is the most lettable size of the farms?—I should say up to 250 acres.

14,553. What proportion of arable would that maintain, and what proportion of pasture?—It varies very much, perhaps one third grass.

14,554. What would a decent farm of 250 acres make per acre?—You must take the difference in the land into account there.

14,555. A fair average farm?—Now there is very little land in Lincolnshire let at 1*l.* per acre, they are all under 1*l.*, except in the fens.

Demand for farms.

14,556. Presuming you had such a farm as that to let, how many applicants would you get for it?—This paper shows all the farms I have let, and, except in the two first cases, the number of applicants in each case (*handing in a paper*). I happened to have kept the particulars in my book, and I have had them copied out.

14,557. I see that for one farm of 55 acres you had 39 applicants?—Yes, that was advertised; that was some four or five years ago. For these little farms under 100 acres you may get any number of applicants; of course I daresay they were not all good men.

14,558. I notice that even in 1893 you had a farm of 437 acres, for which you had two applicants?—Yes.

14,559. And this year you had a farm of 229 acres which was not advertised with seven applicants?—Yes.

14,560. And another farm of 454 acres with two applicants?—Yes, that is a farm I had in hand, and which I have let.

Mr. E. Turnor. 30 Mar. 1894.

14,561. Another not advertised, 46 acres, three applicants?—Yes.

14,562. So there is no difficulty in letting farms in Lincolnshire?—Well, not with small farms you may say; but if you get anything above 500 acres the case is different. Under 250 acres I should certainly say that unless there is any special reason against a farm, unless it is a difficult farm to work, or there is no grass on it, or it is all clay—certainly within the last year or two the demand for the smaller farms has improved.

Land laid down to grass.

14,563. I see in your paper you have laid down a good deal of land to permanent pasture?—Nearly 1,000 acres. I have given the tenants seed, or else paid them for what they have had.

14,564. That is about one-twentieth part of the estate?—Yes.

14,565. Have the rents been reduced on the grass land in the same proportion as on the arable?—I have no purely grass farms, they are all mixed; they are none of them even half-and-half, the arable predominates in all of them.

Restrictions in agreements.

14,566. I notice in your agreement that you charge 5*l.* a ton if the tenant removes straw, or roots, or hay?—Yes, but I never had a case where I enforced that.

14,567. You have never enforced it?—It has never been enforced; it is one of those stipulations which were put in 40 years ago.

14,568. You could enforce it if you liked?—We could, but I do not suppose they ever wish to sell straw.

14,569. You limit them to growing one acre of mangold?—Yes, that is for seed, because that runs the land out.

14,570. I presume you would not enforce such a condition as that, because I have known men who make very large sums of money by growing mangold seeds?—Practically speaking, I suppose no one has ever asked me for it, they do not grow it; it is a precarious thing. In some years you make a large sum of money by it, and the next year you lose by it.

Railway rates.

14,571. Do you think there is any difficulty as regards railway rates in your part of the country?—I have never gone much into the question of railway rates. We have got the Great Northern and the Great Eastern through Lincolnshire, and I have never looked very much into that question.

Expenditure on improvements.

14,572. (*Mr. Channing.*) You state that the expenditure for 60 years upon improvements has been about 155,000*l.* excluding the ordinary repairs?—Yes.

14,573. Have you any figures which would enable us to know what the average ordinary repairs would cost?—10 per cent. on the gross rental I believe used to be the most that a land agent reckoned them at.

14,574. The ordinary repairs?—Yes, the ordinary repairs, excluding new things. But I dare say now that I do not spend quite 10 per cent.

14,575. That would be about as much again as the average of the 155,000*l.* distributed over the years?—Yes. Of course when you get new buildings on a farm for some years there would be no ordinary repairs so that that would diminish it.

14,576. The average would be about 5,000*l.* a year, I suppose?—Yes, it would be.

Schedules of condition of farms.

14,577. We have had a number of witnesses who have stated their desire to have a schedule of the condition of the separate fields on the farm and of the buildings and fences and so on, entered upon the agreement at the time of taking the farm?—Stating the condition of each field?

14,578. Stating the condition of each field and also the condition of the buildings; do you approve of that?—It would be very difficult to work out in practice. My experience of a tenant quitting is that the landlord gets very little for dilapidations if the farm is left in a bad state or the buildings are left unpainted, or the hedges are bad, or there is anything like that.

14,579. If the whole state of the farm, including the buildings, was passed through an inventory in that way at entry, it would strengthen the claim of the landlord in the case of a bad tenant, would it not?—It might cut both ways, I daresay; but still I always reckon dilapidations at a very small sum indeed. I have had one of

Mr. E. Turnor.
30 Mar. 1894.

two cases where I tried to get them. I had an umpire in, but practically one got very little. It was not worth the trouble.

Tenants' capital.

14,580. You have said that farmers are taking farms more suited to a reduced capital; what is your idea of an average capital per acre that farmers working these 250-acre farms in Lincolnshire should have?—I believe formerly the rate allowed was about 10*l.* an acre, but now I generally take a man with from 6*l.* to 7*l.* That is what I reckon. If a man has 6*l.* I generally take him. Of course the cost of entry is less and the price of stock is less.

Farmers and money lenders.

14,581. Have you any opinion as to the power of farmers now for borrowing money on reasonable terms if they require it?—I am afraid the banks will not lend them any money now. In former years they lent them a little too much, they were rather too free, but now they hold a very tight hand over them.

14,582. I will not ask you about your own estate; but do you think that many farmers are falling into the hands of money lenders as apart from the banks?—I do not think so. I daresay some of them have overdrawn accounts and that sort of thing. I am not a banker myself, so I do not know their secrets. I do not know whether they have fallen into the hands of money lenders; if you mean by that the Jews, I do not think they have.

14,583. You are aware that in all the county newspapers, there is an immense number of advertisements of money lenders?—Yes.

14,584. Do they not get a good many customers?—I have not heard of cases of that sort, I know that all the local papers have a great many of such advertisements, but I have had no case come under my own notice where the farmers have gone to those people.

Beer.

14,585. Have you any opinion as to the changing of the law about the substitutes for malt and hops in beer; do you think that would help the farmers on the barley land?—I think it would if you could ensure all beer being brewed from barley instead of sugar and maize.

Swine fever.

14,586. You said that Lincolnshire was free from cattle disease, and all other disease except swine fever?—Yes.

14,587. Do you care to give any evidence as to the carrying out of the present Act?—I think it has been very successful. We have had a good deal of swine fever, but the diseases of cattle have almost ceased in Lincolnshire during the last two or three years.

14,588. Has the operation of the Swine Fever Act of last year done any good as yet?—Not yet, I think; it has hardly had time enough to work.

14,589. Is it being worked satisfactorily in Lincolnshire?—It is being worked; a good many of the Lincolnshire markets are shut up; but there has hardly been time to see what the effect is.

Reduction in rent.

14,590. (*Mr. Everett.*) You told us of the reductions which you have already made in rents; if the prices of this year continue, and especially if they get lower, do you imagine that those reductions which you have had to make, will have ended?—I am afraid not, if things go on as they are.

Fall in prices.

14,591. Then in regard to the question of the malt tax, all the products on a farm have fallen in value, have they not—wool, live stock, and wheat?—It has all fallen more or less, but of course wheat has fallen most of all. But really wheat has almost gone out of our calculations now, we only grow it for the sake of the straw.

14,592. Has not wool fallen very largely, too?—Yes, it has; but it recovered a little bit; it recovered a couple of shillings compared with what it was two years ago.

14,593. But it has fallen 100 per cent.?—It has fallen from what it was in the days of the cotton famine.

14,594. Stock has fallen a good deal, has it not?—Stock has. I think if we get a good fair season this year stock would recover a good deal because the numbers have decreased.

Price of barley and the malt tax.

14,595. Is it not the case that of all our principal agricultural products, barley has really fallen the least?—That is so with the best barleys, but I do not think that it is so with the inferior barleys, they have fallen considerably.

14,596. The point I was coming to is this: is it not probably due to some other cause than the repeal of the malt tax that barley has fallen as it has, and is it not really the fact that something has stayed the fall of barley so that it has not fallen to so great an extent as our other produce?—Good barley is a very difficult thing to grow; it is the most delicate grain there is, and there is very little of it grown and that keeps the price up. If you can grow really good barley there are very few countries that will compete against you except the Saale barley from Germany, and a little Canadian; I believe they sent over a year or two ago some very good Canadian barley. Practically speaking, we can hold our own in growing the best barley, but not the second class and third class barley.

Mr. E. Turnor.
30 Mar. 1894.

14,597. It struck me that you had imputed the fall in barley to the change in the malt tax, while our other products, concerning which no such change has been made, have all fallen really more than barley has?—Yes, I think they have; for the reason that it is difficult to produce there is less competition in the case of the best barley.

The currency.

14,598. Then coming to the question of bi-metallism, by bi-metallism I presume you mean open mints for the two precious metals, gold and silver?—Yes.

14,599. And that each should be full legal tender?—Yes, put them as far as possible on a level.

14,600. Treat them equally. That system prevailed, did it not, until 1873?—Yes, when the Latin Union changed their policy.

14,601. Practically through the world gold and silver were one money at a fixed ratio and were coinable without check or limit in the mints of certain great nations?—Yes.

14,602. Generally speaking you have formed the opinion that the departure from bi-metallism has been injurious to agriculture?—I think that prices have shown a tendency to decrease since 1873, since the change was made in foreign countries.

14,603. In your mind you connect that continual decrease of price with the change that was then made?—Yes, and also the fact that wheat has reached its lowest, and silver, almost at the same time as wheat, has reached the lowest price known.

14,604. Your opinion is that it would be advantageous to return to the former state of things?—Yes.

Lincolnshire, agricultural statistics of.

14,605. (*Chairman.*) I do not know whether you have examined the agricultural statistics with regard to Lincolnshire for the last year as compared with previous years?—I do not know that I have.

14,606. They seem to me to bring out some rather striking facts; for instance, I find that the decrease in the number of labourers was very much greater between 1871 and 1881 than between 1881 and 1891. The reduction beween 1871 and 1881 was 3,700 ——?—Is that the rural population, or labourers alone?

14,607. Agricultural labourers alone; it was reduced from 1871 to 1881 by 3,700, and from 1881 to 1891 by a further 1,400; therefore the reduction in the last 10 years, taking the last year for which we have got figures, was very much less than in the previous 10 years. Then with regard to the farmers the case is even stronger. From 1871 to 1881 there was a reduction in the number of farmers of 1,330, and between 1881 and 1891, of only 170. Do you know what could account for that large reduction in the number of labourers and the number of farmers between 1871 and 1881?—No, I have not looked at those statistics.

14,608. From your knowledge of what has happened in Lincolnshire, you cannot explain why it was that between 1871 and 1881 there was such a large reduction both in the number of farmers and in the number of labourers?—No, I do not know of any cause that should have made it more in those 10 years than in the last 10

14,609. It is a striking thing that the number of farmers should have been so largely decreased in the one decennial period, and only to a very small extent in the second period—the later years?—Yes.

14,610 (*Mr. Dalton.*) Were the small farms between 1871 and 1881 being turned into large ones?—No, I think it was the other way. That might operate a little. You would get four or five good years in the first 10 years. I think, practically speaking, they were all thrown together before.

14,611. (*Mr. Everett.*) Were not a good many farms thrown into the landowners' hands in that decade?—That began about 1878 and 1879. I think the first farm we had was in 1879.

Mr. E. Turnor. 30 Mar. 1894.

14,612. (*Chairman.*) That would only give two years for any operation of that kind in the decennial period that I speak of. Then taking the number of cattle and comparing 1877 with 1892, I find that there has been an increase in Lincolnshire of 61,000?—You have not got 1893. I think 1893 will tell a different tale, will it not?

14,613. That will be due to its being an exceptional year?—Yes.

14,614. But 1892 would show what the average state of the county would be, would it not?—I daresay it might. They did increase, I know, when the country became free from disease; but this last year, if you take 1892 and 1893, both sheep and cattle will show a decrease. I think there are something like 60,000 fewer sheep in Lincolnshire alone in the two years.

14,615. I have not got the figures for 1893, but that would be due to the special drought; whereas the other increase has been apparently a progressive one year by year, from 1870 to 1892, showing that there has really been an increase in the quantity of cattle in Lincolnshire?—The price of store stock got out of proportion to the price of fat stock about five years ago, and people took more to breeding.

14,616. Then I find that, curiously enough, in the number of horses used for agriculture only there has been an increase between 1877 and 1892, from 48,500 to 52,000—an increase of 3,500. That seems rather difficult to understand?—I think people have taken to the only thing there is a profit in now.

14,617. I am not now talking of breeding, I will go to that presently—I am now taking according to the agricultural return the horses used in agriculture; the number has increased from 48,500 in 1877 to 50,000 in 1882 and 52,000 in 1892. Then horses not broken and mares for breeding purposes have increased from 14,500 in 1877 to 19,400 in 1892, an increase of 5,000, which is more than 33 per cent. Have you those figures at all?—No, I have not; but I should think generally speaking that agricultural horses have increased on account of their being such good things to sell. There is a very good demand for town horses.

Mr. E. Turnor. 30 Mar. 1894.

14,618. Those figures tend to show that after all whatever may be the state of the agriculture of the county farmers have increased their stock?—They have certainly increased the sheep and cattle because they found that it was better to breed than to buy. They gave such a high price for young store stock that there was no profit left to feed them. That was the case four or five years ago.

14,619. The figures would also tend to show that there has been no very large decrease in the number of labourers during the last 10 years nor in the number of farmers, but that there was a very considerable decrease in their numbers in the previous decennial period?—I do not think there are any very large number of houses about unlet; there are a few in some of the big villages.

14,620. You cannot account for those facts?—No, not comparing one 10 years with another 10 years.

14,621. (*Mr. Chaplin.*) You told us of a case in which a great quantity of straw has been sold from some fen farm apparently with great advantage to the tenant; do you know what was brought back in its place and if its place was sufficiently supplied with foreign manure?—I think he farmed his own land and that it was not let. I believe he is a very good farmer. It is only just recently sold, so probably there is nothing brought back yet.

Cattle disease.

14,622. Then with regard to this question about the increase of stock in Lincolnshire during the last ten years, that would be very largely accounted for, would it not, by the diminution and latterly the complete absence of disease?—Yes, it would. We had considerable losses amongst the sheep from fluke after 1879 in one or two years, and that has all ceased now.

The witness withdrew.

Mr. Henry Butler Bomford called and examined.

Mr. H. B. Bomford.

14,623. (*Chairman.*) You are a tenant farmer in Warwickshire, I believe?—Yes.

14,624. In what part of Warwickshire?—Very near the centre; it would be to the right side a little.

Particulars of farms.

14,625. What size farm do you hold?—I have three farms; one is 582 acres, that belongs to the Marquis of Hertford. Then the Exhall Court farm is 375 acres, that belongs to the Dudley Trust Fund; they advanced a mortgage upon it, and had to take to the land for the mortgage; and then the Rectory Farm at Exhall, which is 345 acres.

14,626. How long have you held those farms?—The first, the Dunnington Court farm, my father has been in possession of for 59 or 60 years; I have only had it in my occupation for six years. The Exhall Court Farm, was originally my father's; he bought it. I was his tenant for about 20 years, and for the last five or six years, I have had it from the Dudley Trust people. The Rectory Farm I took on a lease on September 29th 1873, at a rent of 510*l.* In the year 1887, on September 29th, the lease was broken. I do not know that it is necessary for me to say why it was broken, I will if you like, and it was retaken at 210*l.* and reduced on September 29th, 1892, to 170*l.*

Reduction of rent.

14,627. What has been the reduction in rent in the other two farms?—The Dunnington Court farm when I took it six years ago, was 700*l.*; then in the years 1891 and 1892 we had 10 per cent. reduction, and last year, on the 29th September, it was reduced to 1*l.* an acre, 582*l.*

14,628. That is now the permanent rent?—Yes.

14,629. Is 700*l.* the maximum rent that your father paid?—No; he paid considerably more than that.

14,630. How much?—He gave evidence before the Duke of Richmond and Gordon's Commission. I do not know whether you have that evidence, but you would get it from that I expect. He was giving, I know, about 34*s.* or 35*s.* an acre at that time, so that really there have been two or three reductions on that farm. It has been reduced from about 34*s.*, we will say to about 20*s.* The Exhall Court farm I used to pay my father 2*l.* an acre for, and now it is reduced down to 24*s.*, but that I have taken on a 7 years' lease, which expires next Michaelmas twelve months. I have had a 5 per cent. reduction off the lease, and so it points to the fact that I am paying more than I ought to pay for that, having taken it on a lease, and that it will inevitably come down at the expiration of the lease.

14,631. You expect a further reduction?—Yes.

14,632. Are these about the average reductions in the neighbourhood?—On the Marquis of Hertford's estate I should think that he has reduced it nearly all within the last 12 months from 10 to 15 per cent. in some cases it may go to 20 per cent. Sir William Throckmorton has a large estate in our neighbourhood, and he has reduced his about 10 per cent.

14,633. Is that within the last two or three years?—Yes, just recently.

14,634. Those reductions, I suppose, follow upon certain previous reductions?—Yes, I should say the reductions have been about the same as my father's that is from 34*s.* to 20*s.*

Average rent.

14,635. Is 20*s.* an acre about the average rent now in your neighbourhood?—Yes, it is about that. That would be rather excessive—it would be from 15*s.* to 20*s.*

14,636. For average land?—Yes; there are some that would be over 20*s.* some of the very best farms even now, but they are exceptional and there would be more under 1*l.*

14,637. Taking the average farms of the district they still let at from 15*s.* to 20*s.*?—I should say so. This Rectory farm I am only giving 10*s.* an acre for 345 acres.

14,638. Is that rather inferior land as compared with others?—Yes, it is a purely wheat-growing land and is not suitable for barley at all.

14,639. Is it heavy land?—It is a marl land, a very poor land; in fact, it is not worth cultivating a great deal. We lay it down in seeds and allow it to lay in two to three years then we cultivate it and break it up and plant it with wheat again.

Demand for farms.

14,640. Do these reductions in rent lead to a demand for farms in the neighbourhood?—I do not think there has been any change for ever so many years. There are

Mr. H. B. Bomford.

30 Mar. 1894.

about the same in the landlord's hands to-day as there have been now for the last ten years.

14,641. If a farm is vacant can it be let at these rents?—It has been up to now, but of course the season has been a very trying one in our neighbourhood.

The season of 1893, and falling prices.

14,642. Your district of Warwickshire has suffered very much from the drought has it not?—Very much for the want of rain. You have been talking about the question of straw for instance. We should not have a third of the straw so the price is really against us. At this Dunnington Court Farm we usually reckon to sell straw—perhaps 50*l.* to 100*l.* worth; but this year we have had to cut nearly every bit of it up into chaff for the cattle and had not any to sell.

14,643. But last year was rather an exceptional year?—Yes, but still the price of straw is against us rather than in our favour.

14,644. Apart from the question of straw, the year was a very exceptional one?—Yes.

14,645. And is therefore hardly to be considered as a fair illustration of the average condition. What I was trying to ascertain was whether apart from last year the farms have been letting at the rents you name?—I think they would. Of course there is this drawback, that the price of wheat has gone down from about 11*s.* to 9*s.* 6*d.* a bag; that might tell if the farms were in the market to-day. These prices have really come down since last September and the farmers have been building their hopes upon the fact that the prices would get better; instead of that they go the other way.

System of cultivation.

14,646. Has there been much change in cultivation in the district?—No. We observe pretty well the same rotation of cropping, or nearly so. We have grown a few potatoes and a few cabbages, and we have grown more peas for picking for marketing than we did years back, because we found them to pay better than wheat growing.

Land laid down to grass.

14,647. Has much land been laid down in grass or not?—No. On the Dunnington Court farm there have been about 40 acres laid down, but that was laid down because it was not very good land, and it was immediately under a wood where they keep a good few rabbits, and the corn was considerably damaged. On my own farm at Exhall Court, I have laid about 20 acres down. I have laid that down myself, but of course, if I am not compensated at the end of my lease, I could break it up and have a crop off it. I have no doubt the landlord will compensate.

14,648. Have other tenant farmers done the same—have they laid down a certain proportion of their farms in grass?—Yes, they have; but not to a very large extent.

14,649. Not to a large extent?—No, I think not.

Acreage under wheat.

14,650. Has there been a reduced acreage in wheat cultivation?—Yes, but not very much. I have the quantity of acreage grown for the last six years on the one farm which I have taken. Last year we were very short; we had only 71½ acres of wheat against 133 in 1888, but this year we have about the same as that—I think it is 120 acres this year, so there is not really very much difference now.

Results of farming.

14,651. Have you suffered losses yourself on the three farms that you speak of?—More especially on the Marquis of Hertford's farm; this year it would come out quite 400*l.* to the bad.

14,652. Apart from this last year, which was, as you state, a very exceptional one, what has been the general result for the last few years?—For the last six years, to take an average of the years, there is not much reason to complain.

14,653. Not much reason to complain?—No; but then of course there is not the prospect before us now of making the money on the produce that we have made during the past six years; taking the next six years it is not at all likely that we are going to make the price for anything that we have done during the past six years.

14,654. That is rather in the direction of prophecy?—Yes.

14,655. What one wishes to arrive at is what your experience has been?—That is quite my opinion.

16,656. We want what your experience has been, apart from the very exceptional year that you speak of; of course, taking the average of the last six years, the prices have fallen considerably as compared with the previous years?—Yes.

14,657. But instead of that apparently you have not done badly, having regard, I presume, to the reduction of rent and the reduction of your assessments?—No; of course the reduction of rent now will tell very much. On this one farm the reduction last Michaelmas would amount to from 15 to 20 per cent. Of course we have that to set against the low price, but whether it will meet it entirely is a question.

Mr. H. B. Bomford.

30 Mar. 1894.

14,658. I wish especially to direct your attention to the six years previous to the last one; you said that the average of those was that you had not done badly?—No, one or two years were very good years; but there is a very great difference in the years. I have some papers that will show it. The value of the stock and corn sold in the year 1889 was 2,293—that is off one farm. Then last year, in 1893, it would be 1,819*l.*—that is a difference, you see, of nearly 400*l.*; and this year, 1894, it will be still less.

14,659. What I was rather trying to eliminate was this last year, which was an exceptionally bad one, due to the seasons; and to ascertain from you whether the reductions of rent which you had obtained had made up for the previous fall of prices, and whether you had done fairly well on the average of years?—I think the reductions may meet it for the future, but they will not meet it if the price of corn keeps, we will say, at the present figure. For instance, I think that we could manage if we made something like 28*s.* a quarter on barley and 3*s.* 10*d.* to 4*s.* on wheat, and about 8*d.* per lb. on mutton and 7*d.* per lb. on beef—I think that that would about meet it.

Rates.

14,660. Have you obtained reductions in your assessment for rates in proportion to your rents?—Yes, they were all reduced immediately.

14,661. Immediately?—Yes, they were all reduced from this very date.

14,662. Are the rates in the pound about the same?—I have taken the rateable value of Exhall parish in 1870, which was 1,191*l.*, in 1894 it is reduced to 921*l.* 15*s.* 6*d.* It required a rate for the half year to pay all the rates in 1870 of 1*s.* 3*d.* in the pound, and now it takes a rate of 1*s.* 5*d.*

14,663. But were the reductions of rent on your own farms in greater proportion than the reductions in the assessment of the whole parish?—I am paying less money for rates.

14,664. Then you have had some advantage in that?—Yes; but I should like to say in reference to the rates that we are in rather an exceptional case, because in many places they have an 8*d.* and 9*d.* rate for school boards, and in some places they have heavy rates for sanitary arrangements, either for making provisions for water or for a sewage scheme. We have nothing of that sort in our parish.

14,665. Yours is a purely rural parish where there is a voluntary school, I suppose?—Yes, there is a voluntary school.

Wages.

14,666. Then as regards the labour, have the wages fallen somewhat, or what?—The wages have fallen from what they were. We are low for wages in our county.

14,667. What are your wages now?—From 10*s.* 6*d.* to 12*s.*, they would be.

14,668. When did the fall begin?—It has been a gradual fall, but there has been a fall of 1*s.* within this last year; we have never been above 12*s.* for a long while.

14,669. Comparing the wages of to-day with those of 10 or 12 years ago, what is the fall?—I daresay it would be about that period that they went up to 2*s.* 6*d.* a day, that would be 15*s.* a week, but that was just for the very best men.

14,670. Then the wages have fallen again to 12*s.*?—Yes, on the one farm for which I have given you the figures the labour has been practically about the same, and there is very little difference during the six years that I have taken. This is the table that I have prepared (*handing in a table*).

14,671. (*Mr. Dalton.*) Does that show the profit and loss for the year for the whole farm?—There are items which I have not put in there; for instance, the hay and straw that we sell, and management, I have not put in. That paper conveys enough for the purpose, I think.

Causes of depression. Rent.

14,672. (*Chairman.*) What in your opinion are the causes of depression?—I say the landlords are reducing

Mr. H. B. Bomford.
30 Mar. 1894.

rents; but we say that the rents practically never came down as soon as they should have done, and that the tenants as a class were losing their capital in paying more rent than they really could afford to pay, and of course that has helped to make things worse.

14,673. With falling prices the rents did not come down quickly enough?—No, we should have had to give a 12 months' notice—still I believe in a 12 months' notice—and so it is a difficult thing to get a reduction; and farmers have been living on expectancy, as it were; they have been thinking that we must have touched the lowest and yet it keeps getting lower. If they had given the notice they would be at the mercy of the landlord about the reduction of rent. Many of the farmers were satisfied for a long time with the landlords giving abatements; but those abatements were very unsatisfactory because you did not know how soon they might cease, and you could not get your assessment reduced, and that was against the farmer, too.

14,674. I think you said you held under lease in one case?—Yes, a seven years' lease.

14,675. Did you get abatements in that case?—I have had 5 per cent. abatements on that.

14,676. Five per cent.?—Yes, for two years.

14,677. Then what proposal do you make in that respect; have you any recommendation to make?—I do not see anything to be done in that way; but of course it might be well to have some Court of Appeal to settle rents; in some cases I believe it would be a good thing, not that I believe it would be brought much into requisition, but it might have a beneficial effect indirectly if not directly.

14,678. Has there been any discussion on that question among the farmers in your neighbourhood?—No, I have not heard them say much about it.

14,679. Is there a Farmers' Association in your neighbourhood?—No, we have nothing of the sort.

14,680. And there has been no general discussion?—No. I think the landlords in our immediate neighbourhood have met their tenants pretty well as they have wished.

14,681. They have made reductions, then?—Yes, they have all made reductions, I should think.

14,682. When you say they were not made soon enough do you apply that to your own neighbourhood?—I think in all our cases we ought to have had them reduced sooner. I think we ought to have been where we are now two or three years ago; that is what I mean.

14,683. It seems to me from your evidence that it was partly your own fault, that the farmers were rather expecting better times, and therefore that they did not give notice to quit when they might have done with a view to getting reductions?—Yes; but I am in rather a peculiar position as regards that. For instance, the Exhall Court Farm was my father's for a time——

14,684. I am not talking only of your own case, but you said the farmers generally had not not got the reductions as soon as they ought to have done, and I think you also said that the farmers were expecting better times?—Yes.

14,685. And having been only able to give 12 months' notice they had not given their notices sufficiently early in order to get reductions of rent?—That is so.

14,686. (*Mr. Lambert.*) It is a very serious thing, I presume, for a farmer to give a landlord notice to quit?—Yes, it certainly is.

Bad seasons.

14,687. (*Chairman*). What is the next question that you wish to bring before the Commission as to the causes of the depression, and as to the remedies?—In our division one cause was the very exceptionally bad crops last year in consequence of the excessive dryness of the weather. On the Dunnington Court Farm the yield would not be much more than half what it had been.

14,688. Was the previous year a bad one, too, in point of yield?—Nothing approaching what it was.

14,689. I mean below the average?—It would be below the average.

14,690. But not so bad?—Nothing like so bad as the last one.

14,691. I presume the best remedy for last year's bad season is a favourable season?—No doubt; I quite agree with you there.

Mr. H. B. Bomford.
30 Mar. 1894.

Prices of cattle.

14,692. Now go to other matters?—There are, no doubt, a great many farmers who would lose on the great deterioration in the price of store stock. Many farmers would be obliged to sell their stock because they had no hay, and very little straw to keep them during the winter, and they would naturally want to get rid of them, and would have to take a ruinous price for them.

14,693. That would throw many cattle on the market and would reduce the price for them?—Yes, no doubt. It was a ruinous price for the farmer to take, but he was almost compelled to sell where he was overstocked. It was not so in my case, because we have not been overstocked, and therefore we did not feel the pinch of it as many neighbouring farmers did.

14,694. How did you tide over the difficulty—by buying in food?—No; we have not bought anything except flour. I have a grist mill, so we use mostly flour. We do not go in for cake very much; we buy foreign barley and maize, and use that largely.

14,695. But your neighbours sold out because many of them were overstocked?—Yes.

14,696. And they had to sell out their cattle?—Yes.

14,697. And they got smaller prices in consequence of other people doing the same?—Yes; in fact, I bought some of my neighbour's stock.

14,698. At a low price?—At about 4*l.* when they were nearly two years old.

14,699. You hope to do well by them, I suppose?—They are all gone now, but still they were not of much account to us because everything we had to give them in the way of hay and straw was so very dear that if you take that into consideration there was not much in it even if you bought in at a low price.

Allotments.

14,699*a*. What else have you to speak of?—I do not know whether you want to know anything about allotments. I have laid out about 80 acres in allotments, and 50 acres of that would be held by men in my employ; some of them occupy four acres of land.

14,700. Are they doing well?—They have been doing very well up till now. I, of course, have had to give them an abatement in rent.

14,701. What do you charge them in the way of rent?—I have here a report prepared some time ago. I see from it that there would be 38 acres at 36*s*. an acre, 13 acres at 1*l*. 11*s*. 6*d*., 11 acres at 20*s*., 2 acres in small garden plots at 60*s*., and 22 acres at 27*s*.

14,702. I suppose you pay the rates and taxes?—Yes. I pay all outgoings.

14,703. What do they cultivate on these larger allotments?—It is all wheat, beans, peas, and potatoes, and a few plots of cabbage now and then.

14,704. Still last year they were doing well?—Yes.

14,705. I suppose they had suffered like other farmers?—Yes, but they did fairly well this time. They had 30 bushels to the acre of wheat nearly all round. Practically, I always buy their corn and sell it for them, and we grind it for them. We do their ploughing. We make a point of charging for everything we do.

14,706. How was it that they did better than the larger farmers?—I did not suffer so much in my own neighbourhood because it is a different sort of farm—it is the Dunnington Court Farm where we suffered so much, because it is on the gravel, and it burns up in the hot season. Ours has a stronger, heavier soil, with a marly subsoil, and it did not suffer to the same extent; if you obtain a good plant of corn you get a very fair crop, but it was owing to a very bad plant and the weather drying it up that really made the one farm turn out so badly and the other one where I am living would not turn out so badly, though it would, of course, be at a loss at present prices. That is how I account for their's. If they kept a debtors' and creditors' account their's would show a balance on the wrong side, I have no doubt whatever. They put a lot of overtime in that they do not charge for.

14,707. And they produced large crops in consequence?—We should not call them large crops, but I call them very good crops for the season—above the average for the season.

Depression in 1880 and

14,708. (*Mr. Whitehead.*) I see in your father's evidence before the Duke of Richmond's Commission

Mr. H. B. Bomford.
30 Mar. 1894.

in 1880, he stated that on Lord Hertford's estate there were 2,000 acres unlet; could you say how much is unlet now on the same estate?—I expect there is very nearly the same amount now.

The present compared.

14,709. He said also on Sir William Throckmorton's estate adjoining there were more?—There would not be so much on Sir William's at the present time.

14,710. So that may we say the depression is about the same as at that time—1880?—I should say that the depression is worse, only it is not really felt as yet; I think we have the worst to come.

Reduction of rent.

14,711. You think so?—Yes, I think so decidedly. Of course if the landlord will meet the case in the way of reductions of rents it may in a measure be averted.

14,712. Was there any great reduction in the way of rents immediately after 1880?—I do not remember. I should think there would be an equivalent of 40 per cent. reduction since then including both the later reduction and a former one.

14,713. A gradual reduction, would you say?—Two reductions we have really had—I should think it would amount to 40 per cent. in the two decades.

Fruit growing.

14,714. I think you grow a good deal of fruit in your district, do you not?—We grow currants and plums and apples and pears.

14,715. Has that been profitable latterly?—The currants and plums have done very well, and the apples fairly well last year, but the pears were almost a failure.

14,716. Is that industry increasing?—Yes, it is considerably increasing with us.

14,717. In your district?—Yes.

14,718. Is there room for increase, do you think?—I think so.

14,719. What is necessary—markets at certain points?—It is capital that is really required. In my own case I should plant more, but there is a difficulty in getting the landlords to assist. It is not sufficient, you know, to find fruit trees; it is too expensive a thing to cultivate trees, though I am planting three or four acres out this year. I have found the trees and done everything, and of course I am depending if I give it up upon getting compensation for it.

14,720. Will your landlords not help you in planting trees?—I do not think these would, because they had to take to the property for a mortgage, and therefore it is rather difficult to deal with. They of course want to sell really, and they would be glad to sell.

14,721. Do you think fruit cultivation might be extended profitably to the farmer?—Yes, it is the most profitable thing I have to deal with.

14,722. If facilities were given by the financial gentlemen?—Yes, or if money could be advanced by the landlords to help their tenants; in some cases I believe it would be desirable. The Exhall Court Farm, I should say, is really owned by two owners; that is, the Capital and Counties Bank have about 50 acres, which they want to sell. That would be very suitable for fruit growing, and if anyone could help to advance money for a tenant to buy and he was to plant the trees it would make a valuable property.

Market gardening.

14,723. As to vegetable growing and market cultivation. I think you said that you grow a great many peas?—Yes, we grow about 40 to 50 acres of peas in a year. We send them in the green state to all the various markets, and then I buy 50 or 60 acres as well, so that I generally pick about 100 acres in the course of the year.

14,724. Is that generally profitable?—It did not answer last year as it did the previous year; it did very well the previous year.

14,725. Might market garden cultivation be attended with advantage, do you think?—I should think so; it is being considerably extended. We live not so very far from Evesham, and the farmers competing with the Evesham gardeners, the Evesham gardeners find that they do not get so much profit out of their things. We have 15 acres of cabbage this time; that is a crop that competes with them, and we can grow it much cheaper than they can, and if it is not marketable we can consume it with the sheep, whereas they can do nothing with their cabbage if they do not sell it.

14,726. Would you think that fruit-growing and vegetable-growing might be in some degree remedies for the agricultural depression?—No doubt it meets it to a certain extent.

14,727. And would not be likely to be much overdone?—I think it may be overdone.

Mr. H. B. Bomford.
30 Mar. 1894.

14,728. That is the danger, is it?—Yes, that is the danger, I think.

Railway rates.

14,729. With regard to railway rates, do they affect you injuriously?—I think not. I do not think that you can expect much alteration in these. They give us very fair rates, I think, if we are sending stuff a distance, and we can make up a fair quantity to send. It is on the small lots where you get handicapped, but if you can make up a two-ton lot to Manchester or Leeds, or Liverpool, or any of those places they take it at a very fair rate. It is in the smaller lots that the difficulty is, but I do not think you can expect them.

14,730. To take them at lower rates?—No. I do not think you can expect the companies to take these smaller lots at lower rates.

Landlords and tenants.

14,731. (*Mr. Clay.*) I think you said the landlords have met their tenants fairly in the depression?—I think they are doing so in our neighbourhood, so far as I can speak locally.

14,732. As a rule did they realise the depression soon enough to save the tenants?—No. I do not think that it was realised soon enough for the farmers.

14,733. Have they realised it fully yet?—I think they are beginning to realise it now; I think they are forced to realise it because they are farming land themselves, the land that they have in their own occupation, and I believe they get nothing out of it, so that they must see the necessity of reducing it to the tenants, and they do it, no doubt, in a great measure to avoid having land thrown on their hands.

14,734. As far as you see, is it your opinion that the land will be decreased in value?—I am afraid it will.

Notice to quit.

14,735. You were asked about a tenant giving notice: it is rather a serious thing to give notice to quit a farm, is it not?—Very; I think so.

14,736. From your knowledge and experience have you known that a landlord will often give a new man a deal more than he will give the old one?—No; I have never known it done.

14,737. (*Chairman*). I understood you to say that the notice to quit in your neighbourhood generally being 12 months, there was a long interval within which they could not give notice, and therefore claim reductions of rent?—Take it from the last September; the moment the 29th of September has gone you cannot give up that farm for two years. Last September we might have thought "Well, there "is a very short crop of wheat, we shall surely have a better price before next harvest comes round," and therefore we say we will wait and see, but then in waiting to see you allow the day to go by and you are tied to that farm for two years, so you are quite at the mercy of the landlord.

14,738. Of course the notice to quit is the engine you have for getting a reduction of rent?—Yes, that is it; if you cannot put the screw on in that way you are handicapped.

14,739. If all the tenancies require 12 months' notice to quit in your neighbourhood you are at a certain disadvantage, I understand you to say?—Yes; for instance, I have one farm on which I have only six months' notice to quit, but then I did it at my own choice. The former lease I had on that farm was for 12 months' notice. It was a glebe farm, and there is this difficulty in a glebe holding: if I were to give notice to give up a glebe farm, and there was no successor, no occupier, and the rector was not in a position to take to the farm, the consequence is that I have no one to pay me for my valuation; it is very awkward holding under a rector.

14,740. (*Mr. Lambert.*) But that is not a usual case at all?—It is an exceptional case, but it is a case that might be, and I thought it was very probable in this instance.

14,741. (*Mr. Clay.*) Is it your opinion that six months would be better than 12 months' notice to quit?—No, I would rather have 12 months' notice in spite of that.

14,742. Then what is your objection to the 12 months?—It depends whether you are very fascinated with your farm or not, and do not want to give it up. I did not want to give it up, but that one farm I should very much prefer at a six months' notice, because in the case of a rector resigning a living I have got to treat with a new landlord, and therefore I

should rather be in a position at a shorter notice whether I would quit it.

14,743. This is a very exceptional case?—Yes, that is a very exceptional case, and that is why I prefer six months' notice.

Farm accounts.

14,744. (*Mr. Dalton.*) Have you kept profit and loss accounts on your farms regularly?—I have on one farm and not on the others, for the simple reason that I have two sets of steam tackle that are always out at work, and a grist mill where we grind for other people, and dealing in fruit and vegetables and peas I could not present an account of my own farm.

14,745. You have not kept an account of the one that is most profitable, I suppose?—Yes, I have.

14,746. Is the one of which you have kept an account the best?—That is the best farm.

14,747. Would that show a profit?—Yes, it would show a profit on the six years.

14,748. A considerable profit?—A very fair profit. It shows a loss on the last year of quite 400*l.*, but taking the six years it would show a profit.

14,749. With reference to this land that was taken on allotments, do you rent that?—I rent it, and sublet it.

Allotments.

14,750. There is a profit, I suppose, on the subletting of that?—The rents are considerably higher than the average.

14,751. Is it better land than the rest of the farm?—Yes, they picked the best of the land. I should be paying about 24*s.* for that, and they have to pay 36*s.*, but then I have all the charges to pay on it.

14,752. You do not consider that you lose by it, I suppose?—No, I think it is about a fair thing between us, and the men are satisfied, and I think I am satisfied.

14,753. Is it worked by the men entirely as overtime?—No, we let them off when they want to go to do their work. The allotments work very well, but the system will only work when the master and the men work together.

Markets.

14,754. (*Mr. Lambert.*) You are pretty near good markets, are you not?—I do not know which you would consider good markets; Birmingham is not often a very good one.

14,755. I mean to say for the sale of milk, fruit, and suchlike small produce?—We sent a lot of our fruit last year to Glasgow and Manchester.

14,756. Why, what was the cause—that it would fetch better prices in Glasgow than it would in Birmingham?—We sent fruit to Glasgow last year that made 12*s.* a pot, and plenty of the same sort sold in Birmingham at 6*s.*

14,757. What was the cause?—I do not know; one market is so much better than the other; that is the only reason I have had 3*l.* or 4*l.* extra on one consignment of goods sent to Glasgow over any other market.

14,758. But you cannot give any reason for that discrepancy?—No, I cannot give any reason.

Wages.

14,759. You said the wages in your district were 12*s.* a week?—Now they would not be; they would be 10*s.* 6*d.* up to 12*s.*, or 13*s.* for the stock men.

14,760. Would there be any privileges for the men in addition?—No.

14,761. They would only have 10*s.* 6*d.* to 12*s.* or 13*s.* clear?—The cowmen and the carters would get their cottage; of course they all get cottages; I have a dozen cottages in the village.

14,762. Do you charge them rent for those cottages?—Those that do not see to the stock.

14,763. I want to know what is the clear wages that your men get, irrespective of all those things?—The carters would get 13*s.* a week and their cottage.

14,764. And the ordinary labourer?—10*s.* 6*d.* and 11*s.*

14,765. And his cottage?—No, not his cottage, not the ordinary labourer.

14,766. So the ordinary labourer has to work for 10*s.* or 11*s.* a week?—Yes, and he has a cottage at four guineas a year, with a good garden to it in every case; he gets his rent out of his garden, as near as possible, every year.

14,767. How large would the garden be?—A quarter of an acre nearly, I should think.

14,768. Are those the allotments that you were talking about?—No, that is independent of the allotments altogether.

Allotments.

14,769. Do you find that the allotments are appreciated by the men?—Yes, you may know that by this: I have 80 acres, and there is not an acre void, and I have two or three ready to take land now.

14,770. You said just now that you had some allotments of the size of four acres; do you find that the men cultivate those allotments properly?—Yes.

14,771. What do they usually grow on them?—Wheat, peas, beans, and potatoes.

14,772. How do they manage the cultivation?—They get it ploughed at so much an acre; they get it planted at so much an acre, and then they hoe it themselves.

14,773. And you find that that adds considerably to their means of livelihood?—Yes, it does, no doubt.

Wages.

14,774. I suppose men could not live on 10*s.* 6*d.* or 11*s.* a week, if they had not some other resources to fall back upon?—I do not know. There are plenty that have to.

14,775. What is the reason that wages are so very low in that district?—I do not really know, unless it is that labour is plentiful; but they are not worse off now than they were when they were receiving two or three shillings a week more money.

14,776. My point is this: in a great many districts men are getting 18*s.* a week?—I know they are.

Land courts.

14,777. Just now you suggested conciliation courts to settle rents; have you formed any idea as to how that could be carried into effect?—No, I do not know how it could be, unless there was someone appointed as a referee to settle disputes. I think the very fact of there being a court of that sort would make the landlord and tenants practically agree to some compromise, and to settle their own affairs.

14,778. You think that the moral effect of such a court would be very beneficial?—Yes, I think so.

14,779. Have you any instances in which farmers in order to get reductions of rent have been obliged to give a notice to quit?—Yes, I know of one case.

Notice to quit.

14,780. And have farmers been obliged to quit owing to excessive rent?—I do not know of a case in which they have actually quitted.

14,781. But they have had to give notice in order to get their reduction?—Yes

14,782. And to give notice to quit a farm with a great probability that he will have to quit is, I presume, a very serious matter for the tenant?—Very, I think.

14,783. How much would you say it would cost a tenant to change from one farm into another, putting it at an estimated per-centage upon his capital?—I have never really gone into that question so as to be able to answer it. It involves so much because it altogether depends upon what sort of farm you are going into. For instance, if you gave up one farm of a certain class and you were obliged to take another which was a totally distinct class of farm.

14,784. There would be a considerable loss?—Yes, there must be a loss.

Demand for farms.

14,785. Is there a good competition for farms in your district?—For just the very best farms there are plenty of tenants to be found, but not for the second-class farms.

14,786. What is the most lettable size for a farm?—I think a small farm would be more likely to let now.

14,787. About what size?—I should say anything from 50 up to 200 acres.

14,788. How many applicants would you probably get for such a farm?—I do not know about that at all.

14,789. What would be the rent of such a farm?—You would have to take about 1*l.* an acre, I expect.

14,790. What would be the proportion of arable or pasture?—They generally average, as near as possible, about one-third grass and two-thirds arable.

Local taxation. Highway rate.

14,791. I notice that you have not put down any remedies for agricultural depression; what should you suggest as a remedy? Have you thought the matter over at all?—I think the question of taxation is one thing that might be dealt with, though I have already stated that our rates are not more than they were, and I am not paying more; still, it does not seem to me to

Mr. H. B. Bomford.
30 Mar. 1894.

be fair that, for instance, when the turnpikes were abolished they should be immediately thrust upon the rates, and I think some means should be devised whereby those who employ the roads should pay part of the expenses in connexion with them.

14,792. You may be aware that there is a large Imperial subvention at the present time?—Yes, but it does not come to save our pockets; for instance, in my own parish of Exhall, we have not a foot of main road in the parish, yet we have to pay towards all these main roads in the county rate.

14,793. Yes, but then yours would be an isolated instance?—There are plenty of cases where it is the same.

14,794. Why have you not main roads?—Because we do not happen to be on the main road; we have to pay the whole of our own rates—at least I am not correct in saying that, because in the last two years we have had a subsidy from the county council towards our roads, but up to then we were doing so.

Tax on horses.

14,795. Have you any other suggestions?—The wheel tax did not go down, but I cannot see why there should not be a tax put upon horses, or rather upon those that use them.

14,796. Do you mean all kinds of horses?—Yes.

14,797. Agricultural horses?—Yes; it is a tax that would be easily collected—collected in the same way as you collect your other taxes, such as the dog tax.

Sanitary rate.

14,798. Have you any other suggestions?—There is the question of the sanitary rate and those rates that may be thrown upon lands; there is a very heavy burden in many places in that direction.

14,799. Are you aware that the land bears one quarter?—Yes, I am vice-chairman of the board of guardians, and we have two or three cases now before us. For instance, there is quite a rural parish called Wincot, where we have before us estimates now for a drainage scheme of 1,100*l.* to 1,300*l.* That will be a very heavy thing on the land, even if they only pay one-fourth, because there is very little building property in that parish.

14,800. What do you propose?—I have not made a proposition as to how it should be raised, but I do not think it seems right that the land should bear it all, unless it is born equally between the landlord and the tenant.

Protection.

14,801. Except the local taxation have you any other remedies to suggest?—Many of the farmers—I suppose I should speak for them—indeed, I may say nine-tenths of the farmers believe in Protection. Many of them go in for Protection pure and simple, many of them believe that all foreign manufactured goods should be taxed, and some believe that foreign flour should be taxed, and some believe in the duty being put on the malt again.

14,802. What is your own opinion upon that subject?—My own opinion is that it would be beneficial to the farmers as a class, but on principle I should object to it. I do not think it is a correct principle.

14,803. Would the state of the agriculturists generally during the times of Protection be an incentive for Protection?—No; they, of course, only think that it is going to send up the prices; that is their argument, and their only reason for wishing it.

Rates.

14,804. You said just now that rates sometimes have a tendency to increase owing to sanitary improvements being made?—Yes, they do increase.

14,805. Would you advocate a division of the rates between landlord and tenant?—Yes, I think it would be only fair.

The Agricultural Holdings Act.

14,806. Have you any opinions upon the Agricultural Holdings Act, or for further compensation to the tenant on quitting his farm?—No, the agreements that I have are very liberal indeed; we get full compensation for everything. There is only one clause in the agreement that I object to, and that is the one clause that mentions that we are to bring back an equivalent for everything that we grow in the shape of hay, straw, roots, and it goes on to mention potatoes. Under the new system of farming which is in vogue now we plant a considerable quantity of potatoes, and it would be a very heavy thing for a tenant to have to bring two-thirds of what he makes on his potatoes back on to his land.

Mr. H. B. Bomford.
30 Mar. 1894.

14,807. Do you think that the compensatory clauses of the Agricultural Holdings Act are sufficient to meet the present case?—I really do not know enough about the Agricultural Holdings Act to be able to answer that question.

Ground game.

14,808. Upon the question of the ground game have you any difficulty in that respect in your district?—Only immediately under the woods we have permission to kill rabbits. On the Exhall Court farm I have the right of shooting all the game. I take it with the farm.

14,809. Do you regard the right of shooting as being beneficial to the tenant?—Yes; we shoot hares and rabbits both.

Reduction of rent.

14,810. (*Mr. Channing.*) Do I understand you to say that reductions of rent cannot be got, in your experience, without giving notice to quit?—No, I do not say they cannot, because they have been, you know, lately got; but I say there has been this difficulty of getting reductions of rent, and that reductions of rent were not got soon enough. I think it was mentioned by some one that it was our own fault that we did not get these reductions, but we cannot get them. Our only alternative way of getting the reductions sooner was to have given notice sooner, and to have brought pressure to bear upon the landlords in that way. I think the landlords are meeting the tenants fairly well.

14,811. Your main point, I understand, is that the reductions were not made soon enough?—No, the reductions were not made soon enough, and thus the farmers as a class lost their capital in a great measure.

14,812. They have been paying away their capital in the form of rent very largely?—Yes; it is a very serious matter in going to a farm that you have a heavy valuation to pay; that takes a lot of the farmers' capital. If in any way the landlord would say he would let it be, it would be a great help to many of the farmers.

Allotments.

14,813. I will ask you one question about these allotments. You said they had the best of the farm; how is that? Is it by your own choice, or by the landlord's choice or how?—It was in my own hands entirely in letting this land; it was immediately adjoining the village, and of course they had it there—that is, the main portion of it.

14,814. Was that a serious detriment to your own farm?—No; I should not have let them have it if I had had any objection to it, because it was my own doing quite.

Low prices.

14,815. (*Mr. Everett.*) I understand you to say that the low prices are the main cause of such agricultural trouble as there is with you?—Yes, and of course the bad season combined with it last year helped. The low prices, I think, is the question that really stares us in the face, and that is the serious question for us to deal with.

14,816. You are under the impression, I think, that the farmers have not worked out the evil effects that are yet to come even if they stand where they are?—I do not see how they can have done so. The second half year's rents are paid in July generally, and the question is how the farmer is to get the money to pay this next half year's rent. If they have not the money do you not think it is very likely that the landlords will meet them and let the rents run on?

14,817. You expect to see great losses in the next 12 months' for instance?—Yes; I think it is a mistake for the landlords to allow tenants to go on when they cannot pay their rents; that is my impression about it, but I know they do do so.

14,818. In your view a better price is the remedy that would most meet the circumstances?—I think with better prices the difficulty would be met.

Notice to quit.

14,819. (*Mr. Chaplin.*) You were asked just now how much it would cost to change from one farm to another; does not that depend entirely upon the circumstances under which the change is carried out?—Entirely it does.

14,820. Under favourable circumstances, would it necessarily entail any cost at all?—Well, it is possible that it might not.

Tax upon horses.

14,821. With regard to your proposal for a tax upon horses, I think you said it was to be a tax upon all horses, including agricultural horses?—Yes.

Mr. H. B. Bomford. Mar. 1894.

14,822. Do you know that the farmers in your district breed horses; is that not part of their business?—Not as a rule; they only breed enough to keep their stock up and so that they can sell one or two off a year.

14,823. Do you not think that a tax upon any part of their stock would be very much resented by the great generality of the farmers?—Not if they had the money back again in the way of relief of taxation. I do not know; of course if they do not have the money back again it might be.

14,824. If you tax a farmer's horses which he breeds is there any reason or principle why you should not tax his beasts or his sheep?—I should only tax those which work. I should not tax horses until they get to work.

14,825. Then you do not mean to tax all horses?—No, only those who use the roads.

14,826. You modify your statement as far as that?—I did not mean it in that sense.

Mr. H. B Bomford. 30 Mar. 1894.

14,827. I thought there must be some mistake. What you want then, as I gather, is rather to revert to the principle that was carried out under the turnpike system, that those horses who use the roads should pay for them?—Yes.

14,828. That is what you mean by a tax upon horses?—Quite so.

Notice to quit.

14,829. (*Chairman.*) I suppose that if there is an expense on the part of the tenant on changing his tenancy there is also expense thrown upon the landlord?—In all probability there would be, because he would have to do the buildings up a bit, and spend a little extra money. Of course one man going out of the farm house and another coming in it would necessarily follow that the landlord would have to paint and paper and do up the house, so that it would necessarily mean an expense.

14,830. Therefore it would be better for both sides to remain as they are if they can?—Yes.

The witness withdrew.

Adjourned to Thursday next at 12 o'clock.

Twenty-sixth Day.

Thursday, 5th April 1894.

PRESENT:

The Right Hon. GEORGE JOHN SHAW-LEFEVRE, M.P., in the Chair.

Viscount Cobham.
The Right Hon. Henry Chaplin, M.P.
Sir Robert Nigel Fitzhardinge Kingscote, K.C.B.
Robert Giffen, Esq., C.B.
Charles Isaac Elton, Esq., Q.C.
Captain Owen Thomas.
Francis Allston Channing, Esq., M.P.
John Clay, Esq.
Cornelius Neale Dalton, Esq., C.B.
Robert Lacey Everett, Esq., M.P.
John Gilmour, Esq.
George Lambert, Esq., M.P.
William Cutlack Little, Esq.

Herbert Lyon, Esq., *Secretary.*
R. F. Crawford, Esq., Freeman Thomas, Esq., *Assistant Secretaries.*

Mr. Frederick Punchard called and examined.

Mr. F. Punchard. 5 Apr. 1894.

14,831. (*Chairman.*) You have been for 28 years agent of the Underley estate in the south of Westmoreland and in the adjoining parts of Yorkshire and Lancashire?—Yes.

14,832. You have also held agencies in the counties of Oxford, Warwick and Northamptonshire?—Yes.

14,833. Are you also trustee for a small estate in Essex?—Yes.

14,834. You have acted in various capacities under the Agricultural Holdings Act?—Yes.

The Underley Estate.

14,835. What is the size of The Underley estate in Westmoreland?—It is about 24,350 acres—that is in the three counties.

14,836. How much of that is in hand?—About 600 to 700 acres are in hand, exclusive of the woods.

14,837. How much is actually let, about 22,400 acres?—Yes.

Depression in Westmoreland.

14,838. Has that part of Westmoreland suffered from the depression of agriculture?—Only recently.

Reduction of rent.

14,839. When did it date from?—We reckon that the depression began about 1876, but it was not appreciated in the shape of reduction of rents until about 1882. From 1876 to 1882 the depression took rather the form of checking the rise in rents rather than leading to any reduction; they had been going up steadily up to that time; then they were checked; then in 1882 the first reductions began.

14,840. Have they continued since then?—They continued more or less. In 1883 there was a still further reduction. Then, for a couple of years, in 1888 and 1889, if there were any farms to relet that had been reduced in 1882, they were let at a trifling increase—the times were slightly better.

Mr. F. Punchard. 5 Apr. 1894.

14,841. In 1886?—In 1886 and in 1882 there was a general reduction all round.

14,842. In 1882 there was a general reduction, but since then?—In 1892 there was a general reduction.

14,843. 1892, not 1882?—1892 was the most general and the largest reduction.

14,844. Up to 1892 were things stationary from 1883 and 1884?—Hardly that, because in 1886 there was a reduction. Then they went up again slightly.

14,845. When you say they went up again do you mean that the farms which were relet let at a somewhat increased rent?—Yes. I have instances of farms which were reduced in 1886 and came to be relet in 1888 and 1889, and they were relet at 5 or 10 per cent. more.

14,846. You mean on reletting?—Yes.

14,847. I presume on those that had tenants in possession the rents were maintained as they were?—Yes.

14,848. It was only on reletting that it showed itself?—That was all.

14,849. I observe from this return that you have put into my hands that in 1879 20,600 acres were let at 23,400*l.*?—Yes.

14,850. In 1882 21,000 acres were let at 24,000*l.*; then apparently in 1886 there was a reduction when 22,000 acres were let at 21,000*l.*?—Yes.

Mr. F. Punchard.

5 Apr. 1894.

14,851. In 1890 22,500 acres were let at 22,000*l.*, and in 1892 22,400 acres were let at 20,000*l.*?—Yes.

14,852. So that there has been a reduction in the last year, 1892?—In 1892 there was a material reduction.

14,853. Now was that a reduction made all round?—On this estate it was, and I might say generally throughout the county.

14,854. Was that an abatement of rent, or was it a permanent reduction?—In our case it was a permanent reduction for three years.

14,855. Not a permanent one?—It is a reduction for three years with every chance of its being permanent, of course.

14,856. What was the per-centage?—It varied very much. Our farms have been unequally let. Some of them had remained unaltered from 1865, and others again that we had bought had been put up to their highest letting value for the purposes of sale, and you can understand that in those cases there was a difierent rating or letting rate. And so in 1892 when there was a general application for a reduction of rent, I asked each tenant to come to me separately. I said, "Come " to me and I will trace the history of your rent, and I " will deal with you according to what the landlord's " outlay has been, the condition of your farm," and so on. So I dealt with each man, and the per-centages varied very much.

14,857. Has the tithe rent-charge been always paid by the owner?—Yes, since 1865.

Expenditure on improvements.

14,858. Has there also been much expenditure on improvements?—Yes, there has been a continual expenditure during the whole period.

14,859. What is the average?—I believe that taking the whole period, that is the 28 years, our expenditure has been 174,000*l.* altogether, made up in this way: buildings and repairs, 130,000*l.*; draining and fencing, 32,000*l.*; then there were allowances and compensation for unexhausted improvements, 12,000*l.*; that was a total of 174,000*l.* in the 28 years.

14,860. 130,000*l.* I think you said was for buildings and repairs?—Yes.

14,861. Can you separate the new buildings from repairs?—No, I tried to, but I am afraid I cannot at all.

14,862. Does it include a large annual amount of repairs on individual farms, or have you only repaired them when you relet the farms?—There is a certain per-centage of annual repairs, and then in addition there have been a considerable extent of new buildings.

14,863. Then the rents now have declined to the level of 1865, except in some instances where the landlords' improvements have raised the letting value permanently?—In some instances they are about 10 per cent. below 1865.

The Underley Estate.

14,864. The Underley Estate was formed out of the purchase since 1831 of numerous local statesmen or yoemen, was it not?—Yes.

14,865. Is that process of aggregation in the district still being carried on?—Still going on, though not to the same extent as it was. One reason is that there are not so many properties to offer: another reason is that the larger landowners are getting tired of it. They find such a poor return from their investment that they are not giving the same prices that they did.

14,866. Is the Underley estate being extended in that way?—Only where there is a gap to fill up, that is all.

14,867. Then the present rental may be taken at about 20 per cent. less than in 1884?—Yes.

Prices of cattle and dairy produce.

14,868. How has the depression shown itself; has it been in the low price of cattle?—Yes; it is chiefly the low price of stock of all kinds, and also in the lower price of dairy produce.

14,869. I suppose it is mainly a dairy district?—Ours is a dairy and a breeding district, and any stock that we have to go off goes off not to the butcher but to the dealer.

Present position of tenants.

14,870. With the reduction of rents, are the tenants now able to hold their own?—Yes, they are doing very well; they paid much better this last rent day than they did the rent day before.

14,871. Have there been considerable arrears on the property or not?—Not very much.

14,872. Not much?—No.

Mr. F. Punchard.

5 Apr. 1894.

14,873 When farms are to let do you find applicants for them?—Plenty.

Demand for farms.

14,874. No lack of them?—No lack at all. Of course, the larger the farm the less the number of applicants, and the smaller the farm the more the applicants; but we have had no difficulty at all. We have never been without half a dozen applicants for any farm that has been to let.

14,875. Men with sufficient capital?—Yes.

14,876. What amount of capital do you generally look for?—We do not expect more than about 6*l.* or 8*l.* per acre.

Number and size of holdings.

14,877. What size do the farms generally run there?—Ours vary very much, and they vary very much in the districts. If you get near to the mountain or Fell districts the farms are larger in area, because they have a large portion of the mountain land let with them, but in lower districts the case is different. I have a return here of the number of holdings we have. You will see we have the largest proportion, between 100 and 300 acres, and we have only 14 farms above 300 acres.

14,878. Have the sizes of the farms been increased since the purchase of the property by the aggregation of yeomen statesmen?—To a certain extent. We have tried to avoid it as far as we could. We have tried to maintain the small holdings, and whenever the house and the buildings would allow of it, we have done so, but whenever we have come to the time when a house requires considerable outlay we have been obliged to give it up and throw the land to the adjoining farms.

14,879. In that way has there been a considerable reduction in the number of farms on the estate?—Not a considerable reduction; there has been a reduction, but I would not say a considerable reduction, because we have aimed at keeping the small holdings as long as we possibly could. Still, there has been a gradual reduction of number.

Small holdings.

14,880. It was Lord Bective's policy to maintain the small holdings?—Yes, he always wished that.

14,881. There is more competition for the small farms than for the larger ones?—Yes.

14,882. Are they generally let at a higher rent?—Yes, they are let at a higher rate per acre.

14,883. Having regard to the landlord's extra outlay in repairs for maintenance, I presume that the return in respect of those small holdings is not equal to the return of the larger ones?—I do not think it is equal to the return on the larger ones.

14,884. Not equal?—No.

14,885. If you take into account the landlord's outlay, that is?—Yes. In the case of small farms the landlord has to do a much greater proportion of the repairs than he does on the larger ones. The little men cannot afford to do very much, and therefore the landlord has practically to maintain the whole of the buildings.

Large and small farms compared.

14,886, Have the smaller farmers stood the depression better than the larger ones?—They have stood it fairly well, and they have paid their rents quite as freely as the larger men, but it has been a question of capital with them. Those that have had sufficient capital have done quite as well as the larger men, but you can understand that the men of smaller capital have, of course, suffered very much more. One can see that the farms are gradually getting poorer, and that is the case almost throughout the whole district.

Yeomen farmers.

14,887. Are there a certain number of yeomen farmers in the neighbourhood still—men owning their own land?—Few.

14,888. Few?—Yes, they have disappeared rapidly of late years. A great many of them went out in the seventies up to 1880, when land was selling so well—they were tempted by the high price that land was producing, and they sold out.

14,889. Did they remain as tenants in their former holdings?—In many cases they did, and in many cases we have still the descendants of the original owners on the property. I believe, myself, that they are doing better as tenant farmers than they were as statesmen or owners, especially when the time came that their properties were mortgaged for family purposes and so on.

Mr. F. Punchard.

5 Apr. 1894.

Yeomen and tenants compared.

14,890. Do you consider that those who are still owners of their holdings have suffered equally with those who have been tenants?—Quite as much.

14,891. I presume in some respects more so if they are mortgaged?—Yes, they have; certainly quite as much.

14,892. I presume they continue to pay the same interest on their mortgages?—They are paying more on the mortgage than they would pay to the large landowner. You see they borrowed upon mortgage at 4 per cent., and these larger landowners cannot buy at more than about 2½ or 3, which is the outside that the land now produces. I say that a man can rent somebody else's land at a lower rate than he can own it.

14,893. Mortgaging three-fourths of its value, I presume?—Yes.

14,894. The interest on the mortgage at three-fourths of its value represents more than the rent?—Yes.

14,895. Has the depression affected those people equally with the tenants?—Quite as much.

The Agricultural Holdings Act.

14,896. What is your experience of the Agricultural Holdings Act?—We have found it work fairly well in our district. It has been generally adopted—or if it has not been adopted, it has led to fixed scales being arranged and acted up to. A great many cases now are settled under those fixed scales, and the public hear nothing at all about them.

14,897. Without litigation?—Without litigation.

14,898. And not under the Act?—Notice is given generally under the Act, and then the parties have agreed to refer it to some one or other, who is looked upon as an authority on the scale, and in many cases they are now left to a single referee.

Tenants' improvements.

14,899. Do the tenants on the estate do much in the way of improvement on the land themselves?—Not in permanent improvement; they do in the way of artificial manures and purchase of feeding stuffs, but not in the way of permanent improvement in the shape of draining or building, or anything of that sort.

Drainage.

14,900. They have never effected any draining?—No, very little indeed.

14,901. Occasionally?—Occasionally they have.

14,902. If a tenant requires the land to be drained, and gives notice under the Act, would the tenant be allowed to drain, or would the landlord do it himself?—I think he would do it himself, but we have never had notice under the Act at all. Men have come to me and said to me they would like a field drained, or something of that sort, and I have had to consider the circumstances of the farm, and have decided as to whether I will do it or not, and whether I charge him interest or not. Since 1882 we have not charged a penny interest for drainage at all, but in some cases where we thought the man has been rather low rented I have said, "I will give you the pipes if you will pay for the labour," and that has been done. In other cases, again, I have drained the fields by way of maintaining rent rather than anything else. A man has said: "Now I want my rent reduced or I want the field drained," and I have preferred to drain the field to reducing his rent.

Notice of claim under the Act.

14,903. Is there any alteration in the Act that you would recommend?—I think it would be an advantage if the time for giving the notice of claim was extended to two or three months beyond the determination of the tenancy for this reason. I think that that would enable both parties to know what their claims would be, and it would give them both an opportunity of settling the matter without any reference to the Act at all. I believe myself that that would work very favourably. Of course, the landlord would still have to have an extended time for giving his notice of claim, or else he must have the right to set the Act in motion—I do not care very much which it is. I think, in that respect, an extension of time would be an advantage.

Arbitration.

14,904. Can anything be done to lessen the cost of arbitration?—I think if farmers would agree to refer to a single referee it would be better, and I think they might do that now, because the rate of compensation is generally fixed or adopted throughout the district. All the valuers know what the rate is, and I think that now farmers might very well leave their case in the hands of a single referee, and that would considerably reduce the expense.

14,905. I presume, generally in the past they have each selected an arbitrator, and that then the two arbitrators have chosen an umpire?—Yes.

14,906. And that introduces three persons into the inquiry?—Yes, it does; it adds very much to the expense.

Mr. F. Punchard.

5 Apr. 1894.

14,907. And I suppose each of the three requires payment?—Yes.

14,908. That, in fact, is one of the main causes of the expense?—Yes, it is.

14,909. You think that by employing a single referee that saving would be effected?—I believe it might. I believe that Act has a good effect in the majority of cases. I will not say that where it comes to a question of legal definition of a clause in the Act, or anything of that sort, it might then be necessary to have the advice of two or three, but in 99 cases out of 100 I am quite sure that a single referee would give quite as fair an award as the three now do, and at considerably less expense.

14,910. Would you go so far as to lay down under the Act of Parliament that a single referee should be selected?—No, I think you must leave that to the people's own wish. If people are disposed to go to law and to quarrel, I am afraid we cannot stop them. I quite admit that it has been the practice on the part of some landlords to run up the expense with a view to checking claims, but that has not been general.

Landlord's consent to permanent improvements.

14,911. What is your view as to the proposal to abolish the landlord's consent for the permanent improvements?—I think that would do a great deal more harm than good, for this reason: that it would take away the landlord's interest and the control over his property, and he will then begin to think, "Well, I "might as well have all I can get out of it while I "have it." I believe that in that respect it will do a lot of harm.

14,912. Do you think the landlords would be unwilling to effect improvements generally upon their properties?—I do not think they would object to do the improvements on the terms laid down in Mr. Channing's Bill; in fact, I believe that they are ready now at any time to carry out improvements upon those terms, but the difficulty is to find the tenant who will agree to those terms. No tenant will come to you now and say, "I will give you 4 per cent. if you will put me "up a new building," or, "I will pay the rent-charge "upon either a new building or drainage." They cannot afford to do it. As I understand it under the scheme of Mr. Channing's Bill that is the course. The tenant is to give notice to the landlord that he requires to do these buildings or the drainage—the drainage is under the Act at present—at any rate, to do the buildings and the other permanent improvements. Then the landlord can decide for himself whether he executes those improvements or not; if he executes them the tenant is bound to pay this interest of 4 per cent., or an annual rent-charge on the basis of the Improvement Companies' rent-charges. I do not think you will find the tenant at the present day that will give you notice to that effect, so that, so far as that portion of the Bill is concerned, I am quite sure that if it became an Act of Parliament it would be a dead letter. Then, still further, I think that the tenant would find that the cost of the improvements is so much greater than the returns that in the end he would be out of pocket, and he would very soon get sick of making the improvements.

Compensation for improvements.

14,913. Then with regard to the proposal for compensation to the sitting tenant in the event of a rise of rent, I think you fix the standard of his farming at the time that you first compensate him?—If he has got his farm up to a very high state and condition and he is compensated for it, that fixes the standard for the rest of his tenancy. If he does not farm up to that standard he ought in justice to repay the landlord for the deterioration. Of course if the plan is followed which is adopted now in the majority of cases, that is, I mean the incoming tenant paying the compensation for manurial improvements, I do not see where the benefit to the sitting tenant is going to be, because he would have to pay it himself. But if the landlord paid it I say that that fixes the standard of farming, and that the landlord must be entitled to compensation if the farm is deteriorated at the time that the tenant gives it up.

Free sale of improvements.

14,914. Then with regard to the proposal for the free sale of improvements, what is your view?—I think that would convert the landlord into a rent charger at once, and it puts an end to his improvement of the estate, because you cannot separate the tenant's improvement

Mr. F. Punchard. 5 Apr. 1894.

from the landlord's, and you cannot sell the one without selling the other. I think the moment you convert the landlord into a rent charger you destroy his interest in the estate and he does nothing for it.

14,915. The tenants in your view then, I presume, would have to bear the cost of maintenance of the farm? —Undoubtedly they would in that case, which at present, in our case, the landlord pays.

14,916. And he would find the investment is not a much better one than it has proved in the past?—He would find it not so good.

Freedom of cropping.

14,917. Then with regard to the freedom of cropping, what is the practice on the estate?—Anybody who can be trusted with it can have it; in fact it is practically provided for in the lease that if they do sell their crop off they return a certain quantity of manure or make an allowance for it. But any man who can be trusted with it can have it at any time. It would be a very dangerous thing to put into the hands of many farmers—a very dangerous thing.

14,918. Is it the habit to give freedom to many of the tenants? — Yes, a good many of them, but generally they do not want the freedom of sale, because they consume nearly all that they produce. It is only when they are thinking of leaving that they ask for permission. During the last two or three years of a tenancy a man begins to want to sell, but except at those times they do not care to sell. Of course we are not near a large town or not sufficiently near a railway station to make it worth while to sell the hay or the straw off.

14,919. I suppose there is not a great deal of straw grown in the district?—No, we buy a great deal more than we grow.

Law of distress.

14,920. Then with regard to the law of distress what have you to say?—I do not see how the abolition of that would be a benefit to the tenant. It would be a benefit to his creditors I have no doubt, but how it is to benefit the tenant I do not understand. At present it enables the landlord to give him credit at times when credit is of value, which he perhaps would not do if it were not for the law of distraint. But beyond that I do not see what advantage it is going to be to the tenant to abolish the law at all.

Protection.

14,921. Then with regard to the remedies for the depression, what is your view?—I am afraid that there is no general remedy that can be suggested. We know that protection, which is hardly to be mentioned, might raise the price of agricultural produce, but then it is entirely out of the question. I do not think any member of Parliament dare get up now and move that protection be reinstated. It is just possible that if the working classes will go in for protecting every manufactured article then they might with it allow a protective duty on corn and so on. With that exception I do not think that we can expect anything from protection.

Rates.

14,922. Then with regard to the rates?—There is a strong feeling with us that land bears more than its proper share of local rates, and that it is much higher assessed in proportion to the profits than commercial premises are. If you take the case of a farm which is rented at 50*l.* a year, and compare the profits from that with a house and shop which is rated at 50*l.*, there is a very considerable difference, in favour of the shop of course, but they both pay the same rates.

14,923. Do you consider that ultimately the rate falls upon the landowner?—Ultimately it may do so.

14,924. It is considered that the amount of rates is taken into consideration when the farm is let?—If the local rates have been high there has been a trifling reduction of rent, but the value of the farm is generally taken on the assumption that a certain proportion of the rates must be paid, that is all. No doubt it is a landlord's question.

14,925. Have the rates increased in your district or no?—No; I should say on the whole that the gross amount is reduced.

14,926. What do they average in the £?—The poor rates will average about 1*s.* 2*d.* in the £ and the highway rates have been about 4*d.*

14,927. Is that the total?—Yes.

14,928. 1*s.* 6*d.* in the £?—Yes, that has been about it.

14,929. They have been maintained at that rate?—Yes, after the Local Government Act came into operation they went down for two years, now they are getting up again because the County Council is spending rather more money, and is demanding more rate.

Mr. F. Punchard. 5 Apr. 1894.

14,930. How much did they go down?—They went down something like 2½*d.*

14,931. Then the amount is not heavy in your district?—No, the amount is not heavy.

14,932. Have the tenant farmers whose rents have been reduced got the full benefit of the reduction in the assessments?—Where the rents have been reduced for a definite period the assessment has been reduced, but where they have got a per-centage returned they have not been reduced.

14,933. In the case you mentioned just now on the Underley Estate where the reductions have been for three years?—They have all got their rating reduced.

14,934. They have got their rating reduced?—All of them.

Sanitary rates.

14,935. There the tenants have got the full benefit of the reduction of rent in the reduction of rates?—Yes. Then there is a strong feeling again with regard to the unfairness of the sanitary rate. Our districts are rather large. I can refer to one where there is a small town, and the district comprises some four or six miles all round that town, it is all one rating area. The town at the present moment is being sewered at a cost of about 4,000*l.* The whole of the land within that district four and six miles away, is paying towards that sewer rate, and will have to pay for the next 30 years.

14,936. That is rather a special case, I think?—Yes, but the same objection is felt in nearly every case, because where you get a cluster of houses together the local authority will do any drainage, or do any water supply, and charge it upon the whole township; but in the case of an individual farm they will do nothing. They say they are not called upon to deal with an individual house.

Tenants on the Underley Estate.

14,937. I observe that there are 247 tenancies in this estate, on which 20,700 acres are let?—Yes.

14,938. Therefore the average is something under 100 acres?—Yes, it would be.

14,939. Do the tenants, as a rule, work themselves?—Yes, they do all the work on the farm themselves.

14,940. Do they employ many labourers or any?—Only the larger farmers; the smaller men do not employ any except in hay time, they may have an extra man in hay time.

14,941. At what acreage do the tenants begin to employ labour?—It depends on the size of the family rather more than the size of the farm. If a man has got a large family he takes the larger farm, and then, as his family begin to go on, he, perhaps, begins to hire outside labour.

14,942. But supposing a man has got no family, at what acreage would he begin to employ labour?—If he has no family he would have to begin at about from 40 to 50 acres.

14,943. And if he gets to 100 acres would he employ two men?—That is about it.

Wages.

14,944. Do the wages of labourers remain about the same?—They have gone down since 1882, but I think that was quite as much in consequence of the public works that were going on in the neighbourhood as anything else.

14,945. You mean that they had risen before 1882 in consequence of public works?—Yes, and also there was the general advance in wages in the towns.

14,946. What has been the fall since 1882?—They have gone down, I should say, from 24*s.* to 18*s.* a week.

14,947. That is a heavy reduction?—Yes.

14,948. That is nearly 25 per cent.?—Yes, it is.

14,949. I presume the labourers have had some benefit in the reduction of prices?—Yes.

14,950. Cheaper meat—a lower rate for meat?—Yes; but you must understand that a great many of the farm servants board in the houses.

14,951. And are fed by the farmer?—And are fed by the farmer, so that the servant himself does not buy the meat.

14,952. When you speak of 24*s.* you do not mean in that case?—No, I mean its equivalent to that. If you hire a day labourer, and he has to find his own board, you would have to give him 24*s.*; but, of course, if you

Mr. F. Punchard.
5 Apr. 1894.

have him in the farmhouse you take his board at about 12*s.* a week.

Reduced outgoings to tenants.

14,953. Has there been a reduction in that as well as in the other case, or no?—Not in the board—there has been a reduction.

14,954. I do not mean in the board, but in the wages?—Yes, in the half-yearly wages. Half-yearly wages have come down quite to an equal extent.

14,955. Then the tenants in your district appear to have had the benefit of the reduction of the rent, of the reduction of labour, and of the reduction of rates?—Yes, but they have felt the reduction in prices more.

14,956. The reduction in prices has been more?—Yes.

14,957. Did your district suffer from the drought of last year, or no?—To a certain extent; we had rather light hay crops, but we had extra good turnip crops, and extra good corn and straw, so that I think our position now is better than it was a year ago.

Low prices.

14,958. I suppose the drought has had something to do with the fall in price of cattle?—Yes. For instance, I was at Carlisle in the autumn, and I found then in one week there was something like 10,000 cattle came from Warwickshire and the midland counties, for sale in Scotland. The result was that any store stock in our own neighbourhood which were for sale then felt the effects. It led to a great drop in prices then.

The hay crop.

14,959. I presume that now the winter is over, you may expect a rise in prices?—We are looking forward to it, but on the other hand, of course, the midland counties' farmers may say we have no hay crop, we will save this year's grass for hay, in order to get up a hay crop, and another year may sell stock.

14,960. In other words the drought last year may have its effect this year in the necessity of economising the hay?—Yes.

14,961. In order to get a better stock again?—Yes, I am sure it will.

14,962. (*Mr. Elton.*) I suppose the price has already gone up a little?—Not very much. Early in the autumn it went up, but I think that was as much owing to the dealers speculating as to anything else.

14,963. I meant quite recently, you have not noticed any recent rise?—No.

The Agricultural Holdings Act.

14,964. About the Agricultural Holdings Act you say the out-going tenants' period for notice might be extended for two or three months; would that not be rather inconvenient, having regard to the incoming tenant?—No, I do not see what inconvenience it would be to him, except deferring the time for settlement.

Notice of claim.

14,965. The incoming tenant would be in a little uncertainty about what he would have to pay?—But then he is in the same position now, because the tenant's claim is never gone into until the man has actually quitted, and you must allow a fortnight for the landlord to put in his counter-claim, so that it really gets to be quite two or three months before any claim is settled now. I do not think it would make any difference in effect.

14,966. You do not think it would have any practical effect?—No.

Arbitration.

14,967. I quite understood what you said about the single arbitrator. The proceeding for arbitration under the Agricultural Holdings Act appears to be somewhat old-fashioned, having regard to the changes that have taken place with regard to arbitration in general, because you are aware that arbitration now is much simpler. The last Arbitration Act passed in 1889 makes the reference, unless two are specified, to a single arbitrator, does it not?—Yes.

14,968. That principle you would like to see extended to the Agricultural Holdings Act?—Yes, I think it might be extended with safety.

14,969. I have got the general Act in my hand, and I see that it very much simplifies all the Acts of Parliament relating to arbitration; that it cheapens the expenses; that it makes the submission irrevocable; that it makes the arbitrator a single one unless an umpire is required, and that if there are two arbitrators they are allowed to nominate an umpire, but that an umpire is not to be a necessary thing, but of course arbitrators under the Agricultural Holdings Act are not included. If they are not included in the scope of this Act, do you think this Act might be well extended to the case of agriculture?—I think it might, certainly.

14,970. The principle is admitted by the Legislature having already simplified all other arbitrations?—Yes, and I think now that the basis of compensation is generally fixed in the various districts, it is very simple work for a single referee.

14,971. There is no object in keeping up the old-fashioned intricate way of arbitrating?—Not at all; that is if the respective parties have faith in the single referee.

14,972. Of course by the general law if they have not got faith in the single referee they can have their wish to have two arbitrators?—Yes.

14,973. That is a very practicable suggestion of yours; the law being in other cases simplified in that way you would wish it to be extended to this particular case?—Yes. I see no objection to that at all.

Small holdings.

14,974. I want to ask you now about the small holdings; what sort of size did you say the small holdings were, 40 or 50 acres?—They vary from 20 and 25 up to 50 acres.

14,975. Were those holdings of 40 or 50 acres generally the old statesmen's holdings?—Yes, a good many of them.

14,976. Were those statesmen the copyholders of the manors?—Yes.

14,977. They were the Westmoreland Tenant Right Manors, that we have heard of?—We have called them the Customary Right Manors—it is the same thing.

14,978. They are held under the ancient law of customary right?—Yes.

14,979. That is to say they got their rights confirmed by law in some way in old times?—Yes.

14,980. A great many of them you say have given up?—Yes.

14,981. What sort of houses are those that are maintained, are they the old houses, or have new houses been built?—They are very poor houses as a rule.

14,982. I suppose they are the old tenements?—Yes.

14,983. Stone cottages 200 years old?—Stone and slate, and in a good many instances the divisions between the bedrooms only go up to about head height.

14,984. That is only a matter of putting up a few boards, I suppose?—Yes, but it shows that they do not spend any more money over the houses than they can help.

14,985. Anything structural like that would be the landlord's part in those places would it not?—Yes, but I was referring to the statesmen.

14,986. I was referring to the statesmen who have been turned into holders under you?—In those cases in many instances we have built new houses, but not on the smaller holdings because we could not afford it.

14,987. In fact in the case of a small copyhold turned into a yearly tenancy as a rule if you find an ancient house on it you must keep it, because you cannot afford to build another?—No, we cannot, and as soon as that house gets past being habitable we must do away with the holding.

14,988. Or else the expense of building a new farmhouse will eat the whole rent?—Yes, it would be beyond all equity or reason.

14,989. Supposing you were to build it under one of the Land Improvement Companies, that is supposing there were funds of that kind available, your house might cost you 500*l.*?—Yes, thati s a rent of 35*l.* say for 30 years; there is no small farm of 20 or 25 acres that can bear that additional rent.

14,990. You are aware that I, of course, have facts in my head, and that I am thinking of a particular holding and of a particular house?—Yes, I understand.

14,991. That is so, is it not, that you might have to expend the whole value on a new house if you borrowed the money?—Certainly, in the case of a small holding.

14,992. Do the small holders find very great difficulty in competing in their agriculture because they have to pay large retail prices instead of wholesale prices for the things they would buy, like manures?—No; we do not find that, because many of them are dealing through the Farmers' Club and the small man gets the same benefit that the larger one does.

14,993. You have farmers' clubs then that meet that difficulty?—Yes.

Mr. F. Punchard.

5 Apr. 1894.

14,994. It does exist in some parts, I think?—We do not find it so with us at all.

14,995. Are you near a railway?—We have the main line of the London and North-Western running through the district.

14,996. The question of railway rates, that is the tonnage rates, and whether you pay more for parcels under a ton does not arise in connexion with these small holdings?—No, we do not find it so.

14,997. Are there many squatters who have turned into tenants?—No, none at all.

14,998. You say that the descendants of some of the statesmen hold as lessees, and that probably a person holding as lessee would be in greater comfort than his ancestor, the statesman?—I am quite sure he is better off.

14,999. He is only one out of the family though?—No; but as a rule the one that did worst was the man who stopped at home; the others have done better. As a rule the second son went into the Church and the others went into commerce.

15,000. One of them would become the schoolmaster in that part, would he not?—Yes; it was the younger sons who did best because they were driven away from home and went into trade; they always did better than those who stopped at home.

15,001. I suppose the one who got the living did not get very much?—No.

15,002. Then they get their profit by getting a market for their personal labour in these small farms?—Yes.

15,003. By getting it turned into produce and money?—Yes.

15,004. But you say their food or social comforts are probably inferior to those of the artizan or small tradesman; do you mean a person living in the same part as they do, or is it the town artizan and town tradesman of whom you are speaking?—I am comparing them with the town artizan.

15,005. But then, of course, life in the country and life in town are under different conditions?—There may be more freedom in the country, but the social attractions are nothing like near to those of the town life.

15,006. Climatic in the country, social in the town?—Yes.

Tenants' improvements.

15,007. About the improvements, you say that to make a property of that dual kind to divide one undivisible piece of land into two properties, one belonging to the tenant under the name of improvements, and one to the landlord under the name of the soil, would be unworkable in your idea?—It is not possible, I think.

15,008. Very likely, but it is proposed very freely?—Yes, I understand so; but I do not see how it is going to work.

15,009. It would be an inconvenient form of dual ownership?—Yes, and it would be prejudicial also to the occupier of the land.

15,010. Because it would naturally be destructive to the position of the landlord?—Just so: it drives away all the landlord's interest in improving his property, in maintaining it even, and I think that is a greater consideration than any benefit that the tenant would get from the sale.

15,011. The landlord would have a sort of fee farm interest in it with no casual profits and no luck, no chance of getting anything?—No, the rental would not improve, but it would gradually dwindle.

Low prices.

15,012. (*Captain Owen Thomas.*) What is your opinion of the reduction in the price of farm produce as compared with 15 or 20 years ago?—Prices have gone down quite a third.

Reduction in rent.

15,013. What has been the general reduction of rents in your district?—It varies very much according to the terms upon which the farms have been let, the larger landowners have been in the habit of having their farms valued periodically, and let upon that valuation. On the other hand, the small or the middle-class owner has been in the habit of letting his farms upon a seven years' lease by tender. Of course, where farms have been let by tender the rents have gone up very much more than where they have been let upon a valuation, and therefore our farms do not all compare. I think you may take it that where the farms have been let by tender the reduction of rent is from 30 to 50 per cent., but in the case of farms let upon valuation it is from 15 to 25 per cent.

15,014. Do you approve of the principle of letting farms by tender?—No, I have only adopted it in the case of accommodation land near a town, but I have never adopted it in the case of an agricultural holding.

Mr. F. Punchard.

5 Apr. 1894.

Letting by tender.

15,015. Have the other liabilities of the farmer such as rates, wages and other expenses been reduced in any way?—They have cut down the labour very much, they are not employing as much labour, I mentioned I think that the gross rates are less than they were; they have cut down the expenses where they could, and they have cut down the housekeeping.

Tenants outgoings.

Interest on capital.

15,016. What interest do you think the farmer made on his capital previous to the fall in prices?—We used to reckon that a man must make three rents, that is, one for himself, one for the landlord, and one to pay expenses; but the local custom of valuing a farm is this, I am speaking of when a farmer goes over a farm to value it with a view to taking it, he estimates what produce he can sell will realise over what he has to pay, and he divides that excess by two, and treats it as rent, he does not take into account the expenses at all, he merely divides the surplus produce.

15,017. What do you say would be the per-centage on his capital, 5, 6, or 10 per cent., or what—before the fall in prices, I mean?—I should think he would be making 6 or 7 per cent. on his capital before the fall in prices.

15,018. What is he making now?—He is making a living, that is all; he is keeping his household, and, perhaps, paying for his clothes, and so on; there is all his profit.

15,019. He was making his living before, and the 6 per cent., I suppose?—Yes.

15,020. Now he is not making the 6 per cent., but he is making his living?—He is making his living, and that is all he is doing.

Present position of tenants.

15,021. You said in your evidence-in-chief that the farms in your neighbourhood are getting poorer, is that for want of capital by the farmers to work them?—Yes; it is in consequence of their not having the profits that they used to have; in the old times, when they made any profit, they spent it on the farm in improving it, and so they gradually got their farms up to a higher condition.

15,022. If these farms continue to be of a deteriorating quality do you think you will have a difficulty in maintaining the present rents even if the prices of farm products remain about the same?—No, I think we can maintain the present rents if present prices continue.

15,023. And the land getting poorer?—It has got as poor, perhaps, as it can be.

Ground game.

15,024. Are your tenants allowed to avail themselves of the Ground Game Act?—Yes, nominally so; but there is not one in 20 who does; it is only when a tenant is going to leave a farm that he thinks of doing it; but, of course, they have the right, and we have never attempted to stop them. At the same time, we have reared a large head of game every year.

15,025. Has there been any damage done to the crops?—Whenever there has been any complaint of damage I have always gone and seen what the damage has been, and compensated them for it; only I would not compensate unless they gave me notice at the time the damage was being done; if a man came to me three months after the damage was done and said, "Now, I had so much damage done," then I refused to pay him. I said, "If you notice any damage being "done and come to me I will come and see the crop, "and I will pay you," and I have done that.

15,026. (*Mr. Channing.*) Have there been many changes of tenancy on the Underley Estate?—No, very few on the whole.

Unexhausted improvements.

15,027. What does the 12,000*l.* compensation for unexhausted improvements mean; has that gone mainly in allowances, or has it gone to the quitting tenants?—It was mainly in allowances; it was in the years when the drop began, in 1882 and 1883, in order to meet the drop in prices the landlord then allowed a very large quantity of bones and lime, and a good deal of that 12,000*l.* has gone there.

Notice of claim.

15,028. You expressed an opinion in favour of the notice of claim on either side, giving a limit of two or three months after the termination of the tenancy?—Yes.

Mr. F. Punchard.
5 Apr. 1894.

15,029. And you are aware, of course, that it is suggested that the claims should be sent in on the same day, and that there should be no revision of the claim on either side; do you approve of that suggestion, or do you think it unworkable?—How are you to know the day when the tenant sends in his claim? If you give the landlord power to set the Act in motion ——

15,030. Let me put my question in another form; do you approve of the suggestion that claims should be sent in on the same day so that neither party should see the claim made by the other party, giving the landlord the right to make a claim? Of course that would have to be given in such a change of the law?—Yes, that would have to be given. Then you must fix a day definitely.

15,031. Do you think it would be workable; that is my question?—I do not see any advantage in sending in the notice on the same day. If you give both parties the right to send in a notice it does not seem to me to matter which day they send it in.

Claims and counter-claims.

15,032. You are aware, I think you stated it in your evidence, that many farmers are deterred from making claims because of the fear of counter-claims?—No, I have never stated that.

15,033. I thought you said that?—It is not the case in our district, I know it is in some districts, it is said to be, rather.

15,034. Do you think it would be a fair plan to the landlord and also to the tenant to have the notices sent in on the same day?—I should not object to it. I think it is rather more to the benefit of the landlord than of the tenant, because it gives the landlord power to set the Act in motion.

Arbitration.

15,035. I understood you to say in answer to the Chairman that you approved of arbitration before a single referee; but you did not think that it could be made compulsory—if it were made compulsory in general with power to both parties to appoint a referee and an umpire if they preferred by agreement, would you approve of that?—Yes, I see no objection to that.

15,036. That would leave the parties free to adopt the present procedure if they prefer it?—If they prefer it, yes.

15,037. Do you think that would be a workable scheme?—I think so. I should prefer myself seeing the single referee in all cases. You cannot satisfy all parties. Some people would feel a grievance, I daresay.

Compensation for improvements.

15,038. You say that the proposal to compensate the sitting tenant would lead to a fixed standard of cultivation. I want to ask you whether it would not be good for the landlord, and good also for the interests of agriculture, if you keep up the standard of reasonably good cultivation of land?—Yes, but that standard must be kept up at a profit. I have a doubt myself whether a high standard can be maintained at a profit, I think in these present times you may say 25*s.* for a pound of improvement, and there I am afraid it might be a clog on the tenant's neck, which he would not thank you for.

15,039. On that point you are aware, are you not, that the opinion has been expressed by several Chambers of Agriculture that the best amendment of the Agricultural Holdings Act would be simply to give the right to the tenant to claim for any increase in the agricultural value of the holding, and the right to the landlord to claim for any deterioration in the agricultural value of the holding, and to get rid of the schedules—to give full right to the landlord to claim for deterioration; would that meet your views?—Where are you going to get your standard to start from? That appears to me to be the difficulty. Who is there that can fix the standard on a farm which he has never seen? If you are going to adopt a standard someone must inspect the farm, and after there is that standard determined the same man must come again 10 or 12 years afterwards and say whether that standard has been deteriorated or not.

15,040. Then your opinion is that it is impossible to schedule the condition of the farm at entry, that it is impracticable in working to schedule the condition of the farm at entry, and then to determine the increase or decrease in the agricultural value of the holding at the end of the tenancy?—Yes, that is my opinion.

15,041. Owing to the difficulty of getting the same man to conduct both operations?—Yes.

15,042. You think one man will take a different view from another, as a rule?—Yes.

Mr. F. Punchard.
5 Apr. 1894.

15,043. Now, as to the proposal to compensate the sitting tenant, you are aware, of course, that that has been put forward in order to prevent a tenant being rented on his own improvements?—Yes, so I understand. I think the case of renting a man upon his improvements is very rare nowadays.

15,044. But supposing a man has carried out a number of improvements which last several years; for instance, limeing or marling, or undissolved bones on pasture, or things of that kind which last more than six years, then if his rent is raised to the full market value of the land, which has partly been created by those improvements, he will be rented on his improvements, will he not?—He will in that way, but I think those cases are very rare. I have never dealt with them myself. We have never raised a man's rent, except for improvements which the landlord has made.

15,045. A good and reasonable agent and landlord would, of course, make allowances for the good cultivation of the tenant?—Yes.

15,046. But the state of the law enables another type of agent and landlord to charge the full value of the land to a tenant under those circumstances, does it not?—It does enable them to do so, no doubt, but I do not think it is very often applied now. A landlord will not part with a good tenant now if he can help it.

The Law of Distress.

15,047. Now about the law of distress, are you aware that in cases where by agreement rents are paid in advance the law of distress can be held to operate so as to enable the landlord to recover by distress nearly two years' rent?—Yes; the Agricultural Holdings Act itself provides that.

15,048. The intention of the Agricultural Holdings Act is to limit it to one year?—Yes, one year back, and then the agreements provide for a year forward.

15,049. In cases of that kind, it would be an injustice, would it not, to the tenant, as he has agreed to pay in advance?—I do not think it is an injustice to the tenant; it may be to his creditors, but not to the tenant. I do not think it hurts the tenant.

15,050. It is prejudicial to the creditors in any case?—Only to the creditors, and it only applies when the man has got into difficulties.

Compensation for improvements.

15,051. Do you approve of compensation being given under the Schedule for the consumption of home-grown corn?—The difficulty I see in that case is the evidence. If I were acting as umpire I should find a very grave difficulty about the evidence. I could not take a man's word for the crop that he had produced.

15,052. You do not think it would be practicable?—No. I do not think it is practicable myself.

15,053. You are aware that compensation for increased fertility by continuous high farming has been advocated by many witnesses, are you not?—Yes.

15,054. What is your opinion on that?—Does not the tenant get that benefit until he leaves the farm? So long as he is on the farm he gets the benefit by the continuous improvement.

15,055. I am talking of compensation on quitting?—Then does he not get that under the present Act?

15,056. There has been one arbitration carried out in that spirit?—In Scotland?

15,057. In Durham?—Yes, I believe so.

15,058. But it might have been appealed against, might it not?—We have a practice amongst the local valuers of varying the rate of compensation according to the system which has been adopted. If we find a man has been in the habit of continuously farming high we allow him a higher rate of compensation than when it has been only partial or casual.

15,059. You classify the improvements in that way?—Yes.

15,060. Then how does that agree with what you said about a single referee, and that the scale was so settled?—Because our scales are, as it were, elastic. In our own scale, for instance, I have power to allow 20 per cent. or to deduct 20 per cent.

15,061. You have a time scale for the exhaustion of improvements?—Yes.

15,062. Should you also make additions in valuation for cultivation above the usual standard?—Yes, we try to make it as fair as we can.

Mr. F. Punchard.
5 Apr. 1894.

15,063. You have referred to a clause in my Bill with regard to the right of the tenant to obtain or carry out first class improvements; are you aware that it was not proposed to give the tenant this right to obtain them unless a reference under the Agricultural Holdings Act showed that the improvement would add to the agricultural value of the holding?—Yes, I understand all that; but my point was this: that I do not think there is one tenant in a hundred who would put that Bill into operation.

15,064. Still it will enable the tenant to have his farm properly equipped by giving notice, and by a reference under the Agricultural Holdings Act?—Yes, but will it not prejudice his position in another way? Supposing that Bill is in general operation, a tenant goes to a landlord and says: "Now I want you to build "me a new building," or "I want a field drained," or "I want some improvement made"; the landlord immediately turns round and says: "Give me notice under "the Act and I will do it according to the terms of the "Act and I will not do it otherwise."

15,065. The terms are reasonable, are they not?—In a great many cases now, the landlord does those things without charging any interest at all, and I think the tenant's position would be worse under that Act than it is now.

Ground game.

15,066. As to the use of the Ground Game Act; do you know of any cases in which tenants have had notice to quit owing to their free use of the Ground Game Act?—No, I do not know of any case at all. We had one case on the estate where the tenant quarrelled with the shooting tenant, but it was not on the question of the ground game at all; it was a question of charges for accommodation. The shooting tenant had lodged in the tenant's house, and they quarrelled about prices; but I have not heard of a single instance in our neighbourhood of a tenant receiving notice to quit because of his using the Ground Game Act.

15,067. In a case of that kind—I will not ask you whether this case was of that nature—do you think a tenant would be entitled to some compensation for disturbance in addition to compensation for his improvements?—No, I do not think so; he has got the Act and he can use his powers under the Act if he likes; he gets all that he is entitled to.

15,068. (*Mr. Lambert.*) What are the main productions in your part of the world?—Dairy produce and young stock.

15,069. Do you graze the stock or sell it fat?—No, we keep all the heifer calves and bring them up till they become dairy cows, but the bull calves are sold at about 6 months or a year.

15,070. Do you grow any wheat at all?—No, there is not a field of wheat within 20 miles of our house.

Fall in prices.

15,071. How much do you think the produce or the commodities that you produce have depreciated in price?—Stock itself has depreciated quite 30 per cent. but dairy produce has not come down to that extent.

15,072. Have beef and mutton depreciated 30 per cent.?—Yes, quite, in the carcase, not in the butchers' price, but in the carcase.

15,073. Why is it that it has not depreciated in the butchers' price?—The butchers tell me that it is this: that the importation of foreign meat has led to a reduction in the consumption of the inferior parts of the English carcase, and so the butcher is not able to make as good a price of the secondary parts as he used to do and therefore he is obliged to maintain the high price of the best joints because he is making less of the rest of the carcase; that is what the butchers tell me.

15,074. Do you think it is reasonable yourself?—I believe so. I have noticed that after a great strike in any of the northern districts there has been immediately a drop in the carcase price of beef or mutton, and I believe it is purely for the reason that the miners or the mill hands when they have been in constant work have lived fairly well, and have consumed the secondary parts of the carcase, but the moment they get on strike of course they have to drop their consumption of meat and so on, and that has led to the reduction in the price of the carcase.

15,075. You spoke just now of farmers' clubs; that is farmers' co-operation, I presume, you mean?—It is a farmers' club, and you may call it a co-operative club, but they do not work at a profit.

15,076. No, but I mean to say that it is co-operation?—Yes, it is.

Mr. F. Punchard.
5 Apr. 1894.
Co-operation.

15,077. That is, a number of farmers join together, and that is an advantage to them, is it not?—Yes.

15,078. If such an arrangement is of advantage in buying articles that they require, may it not be of an advantage in selling articles that they have to sell?—We have tried to induce them to join in the selling part, but they will not; each man thinks he can do better for himself than by selling through a co-operative interest.

15,079. Then you think that there is a lack of unanimity among the farmers in that respect?—On that side of the question there is.

Letting by tender.

15,080. To what do you attribute the fact that when farms are let by tender they are let at a higher rent than they are by valuation?—It may be the wish of the intending farmer to get the farm, or it may be that he really does not know how to value the land.

15,081. That would mean that there are a good many farmers who are not judges of their own business?—I think it is very likely so far as the renting of the farm goes.

15,082. They do not actually know what a farm is worth to rent?—No, I am afraid not. They do not employ anybody to value for them, and they have over estimated the produce probably.

15,083. I presume there being several applicants for every farm, farmers are desirous of getting into a farm, and therefore they offer sometimes a higher rent than even the farm can be made to produce?—Yes, especially if it is under a good landlord.

Reduction in rent.

15,084. What is the average reduction of rents since 1865?—They went up from 1865 all through the seventies from 20 to 30 per cent., and even up to 50 per cent. in some cases where they were let by tender, and they have now come down to about 10 per cent. below the prices of 1865, except where a landlord has spent a good deal of money in improvements.

15,085. Practically, I presume the rent is just the same as it was in 1865?—No, rather lower. If the farm is in the same state now that it was in 1865 it is 10 per cent. lower.

15,086. Do you think that the landlords know the value of their estates?—I do not know whether they do themselves—they have to leave it very much to the agent, of course.

15,087. Do you think the agent does?—Well, he thinks so. But of course they are not all of the same opinion, and they have not all the same instructions from the landlord. One landlord may say: "I do not "want the farms put up to the full value; I am con-"tent to take 10 or 15 per cent. less than the top "market price," whereas another man, whose money affairs we know nothing about, but who may from necessity be obliged to get the last penny he can, will naturally say: "You must let the farm by tender, and "get as much money as you can." It depends upon the landlord and the landlord's requirements.

15,088. So that the landlord really does not scruple to take even a higher rent than the farm can produce?—I will not say produce; he will take what is offered in many cases.

15,089. Although he may know, or the agent may know, that it is more than the farm can produce?—You cannot help that; it is human nature; and also you must bear in mind that a landlord who is dependent entirely upon the income of his land is a poor man now. If he has got an income from other quarters he can manage to do very well, but if he is dependent entirely upon his land he is a poor man.

15,090. How much is the Underley estate let for?—About 20,500*l.*

The Underley Estate.

15,091. You can hardly call a man a poor man with 20,000*l.* a year?—He would be at the rate he has spent money if he had not had an income from other sources. If you will look at that sheet of expenditure you will see that in 1873 and 1874 he was out of pocket upon a rental of 18,000*l.*

15,092. Of course I will not pursue that subject further. You say the depression began in 1876, but that rents only began to be reduced in 1882?—That is so.

15,093. Was that because the farms were not rented up to their full value although they were let by tender

Mr. F. Punchard.
5 Apr. 1894.

in 1876?—They were up to their value, but the landlords in many cases gave them some bones, or something—anything rather than reduce the rent.

Tenants' capital.

15,094. Do you think in many cases the farmers paid their rent out of their capital?—Not then; they have done since, I believe.

15,095. Can you estimate in what proportion the farmers have paid rent out of capital?—I do not know, I am sure. I should be inclined to think myself that their capital has gone down from 20 to 30 per cent.

15,096. That the farmers' capital has gone down a third?—Yes, quite, I should think.

15,097. Of course that means in at any rate some instances that that has been paid in too much rent?—Yes, no doubt it has been so.

Yeomen and tenants.

15,098. You said just now that the yeomen had suffered as much as the tenants, or more, I think you said?—Quite as much, I think I said, as the tenants.

15,099. That is, I presume, where they are mortgaged?—Yes; I am afraid that nearly all the yeomen's estates are mortgaged.

Mortgage.

15,100. Why are they mortgaged?—For family purposes.

15,101. A legacy is left out of the farm, and the owner has to pay, and he raises money by mortgage, is that so?—That is it.

15,102. Do you approve of this system of mortgaging farms?—You cannot help it; but it is not a good thing for the estate.

15,103. It is not beneficial for the land?—No, I do not think it is.

15,104. Or for all those who are engaged on it?—No, I do not think it is. If the income is free it would be very much better.

Arbitration.

15,105. You think that in an arbitration a single referee would be no injustice to either side, and that his valuation would be practically fair?—I think so.

Ground game.

15,106. With reference to the Ground Game Act—I do not wish you to answer this if you would rather not do so—in how many cases have you allowed compensation for the depredations of game?—I cannot speak offhand; there have been two or three claims a year sometimes, and then, perhaps, there have been two or three years without any claim at all.

15,107. What is the damage done by, winged game or ground game mostly?—Winged game chiefly.

The Law of Distress.

15,108. You have expressed yourself as unfavourable to the abolition of the law of distraint?—Yes, I do not think it will benefit the tenant at all.

15,109. Would it have any effect in this way: that the landlord, knowing he has a first charge on the tenants' property, would be inclined to accept, especially when farms are let by tender, a higher rent knowing that he is secure?—He will always inquire into the tenants' security, you know. There is no landlord with us who ever takes a strange tenant without inquiring as to his means, and he would not let a farm to a man who is short of capital any the more because of the law of distraint, not at all.

15,110. He would not?—No. I do not think it makes any difference in that respect at all.

15,111. Then why would you put the landlord upon a different footing from the other creditors?—Because he has to wait longer for his return, and his rent is not collected day by day; he cannot stop it at any moment, I mean. A tradesman, if he finds that his creditor is getting into arrears, or doing badly, can stop his debt at once; the landlord cannot stop his debt, the rent goes on growing until the end of the year.

15,112. But if a tenant does not pay the rent the landlord surely has the right of giving him notice to quit?—Yes, and generally does when he does not pay his rent within six months.

15,113. In six months?—I mean six months after the ordinary time for payment.

15,114. Then he practically has the remedy in his own hands on the stoppage of the payment?—Yes, but there is a year to run after the notice, you know, in the majority of cases.

15,115. In answer to a question of Mr. Channing, I think you said that in some cases the landlords could distrain for two years' rent?—That is where the rent is reserved in advance, and where there is a power to distrain in advance.

15,116. Would you be in favour of that?—We have it in our leases.

Mr. F. Punchard.
5 Apr. 1894.

15,117. You have?—Yes, for protection.

Remedies for the depression.

15,118. What remedies do you suggest for agricultural depression, or are you pretty contented as you are with the present reduction of rents?—I am afraid there is not any general remedy for the depression; what is wanted is an improvement in the prices of stock and produce, but how that improvement is to arise I cannot say. I am sure. I have great faith myself that if the trade of the country improves prices will improve with it.

Sanitary rate.

15,119. (*Mr. Dalton.*) I think you say that the sanitary rates press hardly on the farmers?—I will not say that they press hardly, but that they are a source of grievance.

15,120. What do they average in your district?—It depends very much upon whether the local authority has done any drainage or not. Where they have done the drainage the money is borrowed upon a rent-charge for 30 years, and it becomes rather a heavy burden.

15,121. Do you know of any high sanitary rate in your district? I see from a return here that taking the whole of the county of Westmoreland the rural sanitary rate is very low indeed?—Yes, it is.

15,122. Do you know of any particular case in which it is high, and what is the extent of it in the highest one that you know of?—They are growing; the local authorities are just in the way now of doing all this sewerage and water supply. It has not got into actual operation and so one cannot say what the rate will be.

15,123. You do not know of any at present?—No, I have not any in my own mind.

15,124. You spoke of one case where land was rated for sewers carried out four or six miles away?—Yes.

15,125. That must be one enormous parish, I suppose?—Yes.

15,126. Because in a rural district the cost of the sewers falls on each parish and not on the whole district?—Just so; but then this happened to be rather a large parish.

15,127. A very large parish?—A large rating area.

15,128. If the cost was spread over the whole of that area I suppose it would become a very light charge?—It becomes a very light charge, but those who are living four or six miles away do not see any reason why they should pay any portion of it.

15,129. Then I think you said that it was a grievance because, taking the case of a farmer with a rent of 50*l.*, and a house and shop at another rent of 50*l.*, they were rated in the same way although the tenant made a different profit in each case?—Yes; the shopkeeper makes a much larger profit from his 50*l.* shop than the farmer does from his 50*l.* farm.

15,130. Can you assess according to profits; supposing you had two farms side by side exactly the same, and one made a larger profit than the other, would you rate them differently?—You should do where you can, but, of course, you take the rent as a criterion of profit.

15,131. Must you not take the rent as a criterion everywhere, in a town as well? You may have a shop carried on at a loss, but you would not say that that shop was to escape being rated because a man made a loss in it in a particular year?—No, but I say that shops make a greater profit than land, and therefore the shops ought to be rated at a higher rate.

15,132. How would you rate a house in which there is no question of profit, which is a residence?—I would make the urban rating general for all rates, that is, let a house and buildings pay upon the full value and the land upon a fourth. I would like to see that general for every rate.

15,133. For every rate of every kind?—Yes.

Agreements.

15,134. (*Mr. Chaplin.*) I was not here, I am sorry to say, when your examination began, and so if you have answered this question, do not answer it again: under what kind of agreements or under what tenure are the farms on your estate held?—They are all yearly tenancies.

15,135. Under the Agricultural Holdings Act or under agreements?—Under agreements with a schedule of compensation.

15,136. I suppose you have had a considerable number of farms change hands in the last 10 years?—Not on

Mr. F. Punchard.
5 Apr. 1894.

the estate; we have had very few changes, but in the district there have been a good many.

15,137. In the changes that have occurred on your estate, I suppose you have had to reduce the rents?—Since 1886.

15,138. Have you had any applications for any modification of the agreements?—No; they have always accepted the printed agreement I have put before them.

15,139. Although they have required a reduction in rents they have been quite satisfied with the agreement?—Quite; they have never raised any question upon it at all.

15,140. Is that generally the case in your district?—Yes; we do not find any objection to the agreements at all.

15,141. Although there have been repeated changes in the rents they are satisfied, so far as you can judge, with the terms on which the farms are held in other respects?—Yes, they always sign the agreements, and, as far as I can make out, without any question.

15,142. And they have the opportunity of carefully studying them?—Yes.

15,143. In fact, I suppose, the agreements on your estate are perfectly well known?—Of course.

15,144. Before they take the farms at all?—Yes. A copy is always handed to a man when he applies for a farm, and he takes it home and reads it over.

Notice of claim.

15,145. I observe that you say that you think an extension of the time for giving notices of claims to one, two, or three months after the expiration of the tenancy would be an improvement in the Agricultural Holdings Act. What I want to ask you is this: Provided that care is taken that the Act shall be set in motion, is there any absolute necessity for any periods of claim at all?—No, except that there must be some limit to the time when a man must put in a claim. It would never do to let the thing hang over for a year or two and then to put in a claim; there must be some limit to the time.

15,146. After which he cannot make any fresh claim?—Yes.

15,147. That I can quite understand, but subject to that is there any other necessity for giving notice?—No; in my own schedule I do not require notice at all.

15,148. Exactly; neither landlord nor tenant is required to give notice?—No.

15,149. But the tenant makes his claim as a matter of course?—Yes.

15,150. Then, subject to the limit of time, after which claims cannot be made, you think there is no necessity for a claim at all?—No, there need not be.

15,151. Would you recommend an alteration in the Act to that effect?—I think the most satisfactory alteration would be, as I suggested, to put a limit of, say, three months after the determination of the tenancy.

15,152. And after that no further claim is to be made?—Yes. I want to give the parties the opportunity of coming together and settling their difference without notice.

Compensation for improvements.

15,153. You were asked just now whether tenants were not sometimes rented on their own improvements; now, I apprehend that you have had a very wide experience; do you know of any cases in which this has occurred?—I know of very few indeed in our own neighbourhood—very few.

15,154. Then you were asked whether it was not the fact that the state of the law would enable such an addition to the rents to be made; if it did happen in one of those rare cases, which, I understand, may have occurred, the tenant would get full compensation for all his improvements, would he not?—Not until he quitted.

15,155. But if he chose to give up his farm he would get full compensation for everything he had laid out?—If he left them he would, of course.

15,156. If it was attempted by the landlord, I suppose in most cases he would run the risk of losing his tenant, and would probably lose him?—Yes; he would get a bad name in the district, and his tenants would not farm as well under him as they would under a man whom they had confidence in.

15,157. The object of every landlord nowadays necessarily being to keep a good tenant, he would run great risk of losing him?—I think so; they all try to keep their good tenants if they can.

15,158. As far as your experience is concerned, throughout the whole of your own district, can it be suggested that the case suggested to you is in any way whatever a practical grievance at the present time?—No, I am quite sure it is no grievance in our neighbourhood.

Compensation for high farming.

15,159. I did not quite understand what fell from you with regard to continuous high farming. I think you were asked as to whether you advocated compensation for continuous high farming being given to a tenant on quitting; is it not the fact that the tenant is compensated in the first place while he has the farm by the improved condition of the land itself, and that when he goes he is fully compensated for the large outlay which he has made during all those years, or during the latter part of those years?—Yes, I say that so long as he is in occupation he gets the benefit of his high farming, whatever it may be, and directly he leaves he is compensated for it. According to the practice of our local valuers he is compensated at a higher rate if he has farmed well than if he has only farmed middling. We vary the rate of compensation according to the system of farming that we know the man to follow.

15,160. Is it not generally the case that a good farm on a good estate is let to what is presumably a good tenant and there is an implied understanding that of course he will continue to farm it in a good condition?—Yes.

15,161. Then to ask for compensation for continuous high farming would be to give a man compensation for what, as a matter of course, it would be only his duty and his engagement to do?—Yes; then I say if he has once been compensated for getting his farm up into a high state, he must maintain that without any further compensation and what is more he must repay to the landlord any deterioration.

Tenants' capital.

15,162. I rather gathered that you were of opinion that in some cases a tenant's capital had been diminished partly by the fact that the rents were too high for the times?—Yes, the rents were not reduced early enough.

15,163. What was the case during the good times; then, I suppose, tenants made very considerable profits and increased their capital?—They increased their capital considerably.

15,164. Considerably?—Yes.

15,165. That would be because at that time the rents were too low?—It was a general prosperity all round.

15,166. But if it is fair to say that the tenants had lost capital because rents had been too high during the bad times it would be equally fair to say that they had added to their capital in the good times because the rents had been too low?—Yes. If you take the case of many of our tenants they are the same people that were there in 1865 and if you compare their capital now with what it was in 1865 it is about the same thing; but in the seventies they added to that capital and in the eighties they have lost it.

15,167. In fact it comes to this, that they have increased their capital in good times, and they have lost it in bad times?—They have lost it in bad times as the landowners' property has gone down in value in the same way.

The Law of Distress.

15,168. You replied in answer to a question just now as to why a distinction was to be made in the matter of the law of distress between the owner of the land, on the one hand, and a tradesman on the other, that the landlord cannot stop the debt; you mean, I suppose, that he must give credit for the rent up to a certain date?—Yes, and then he cannot terminate his tenancy in the middle of a year. Our tenancies run from Candlemas, and we cannot stop a tenancy in July, say.

15,169. Then it was suggested to you that a landlord could protect himself by giving a notice to quit, and that the affect of the abolition of the law of distress would be very often to compel the landlord to take that course—that would be so, would it not?—That would be so, undoubtedly.

15,170. I suppose nothing much more unpopular than any legislation which encouraged or rendered it necessary for landlords to give notice to quit, which

they otherwise would not do, could be imposed in the interests of tenants?—Certainly; I have always avoided giving notice to quit if I possibly could avoid it.

15,171. There is nothing, I suppose, that a tenant likes less than a notice to quit?—No, and there is nothing more disagreeable to a landlord or to an agent.

15,172. And any legislation which would encourage or make more necessary that practice would be very undesirable?—Certainly, very.

The Agricultural Holdings Act.

15,173. (*Mr. Little.*) You have had a good deal of experience under the Agricultural Holdings Act, I believe?—Yes, I have acted in all capacities under it, I might say.

Scale of compensation.

15,174. The valuers in your neighbourhood, I understand, have agreed upon a scale of compensation?—Yes.

15,175. For manures and feeding stuffs?—Feeding stuffs, bones, and limes.

15,176. Those would be the principal items, I suppose?—Yes.

15,177. Then you have classified your scale of compensation in respect of the state in which the farm is found?—I do, myself.

15,178. That is not part of the scheme, then, that has been adopted by the valuers?—No, but I have to argue both ways sometimes. I am always bringing it before the respective valuers, and we are very frequently discussing it, and I find that there is a very general opinion in favour of adopting that.

15,179. That is quite in accordance with the principle of the Act?—Yes.

15,180. The compensation is to be the value to an incoming tenant?—Yes.

15,181. And you act upon that by classifying your farms as under a first or second or third rate condition, and compensating accordingly?—Yes, we try to carry that out as far as we can.

15,182. Your agreements on the Underley Estate are substituted agreements, I presume?—Yes.

15,183. Is the scale of compensation laid down in them?—Yes.

15,184. Would you mind handing in a copy?—Certainly not (*handing in a copy*). (*See* Appendix I.)

15,185. Thank you. Do you find that, generally, tenants prefer a definite scale of compensation to the indefinite terms of the Act?—We find now that they prefer a definite scale. Quite recently I have had the tenants coming to me and saying, "Can you give me a "copy of your scale, because I am going to ask my "landlord to compensate me according to that." In many cases the landlord and tenant have come together and they have said, "We will settle according to the Underley scale."

15,186. They would rather agree to take for compensation something that they can rely upon than run the risk of an arbitration?—Yes, and also it saves expenses very much.

Notice of claim.

15,187. You propose that an extension of time after the expiration of the tenancy shall be given for the claim; is there any particular difficulty in making out a claim when the tenancy ends?—No, but you see according to the Act the tenant is to give notice two months before the termination of the tenancy. He cannot say what the consumption of cake and feeding stuff is going to be for the last two months, and therefore nothing can be done after his notice is given until his tenancy is terminated.

15,188. I gather from what you said in your reply to Mr. Chaplin that you would not object to seeing this notice done away with, but you would provide that on or before a certain date a man should make a claim or rather that he should not make a claim after a certain date?—Yes. I think we must fix a time when a man can make a claim.

Claims and counter-claims.

15,189. Do you think it is at all required that a landlord should have time, after the tenant has made a claim, to make up his?—He must or else you must give the landlord the power to set the Act in motion—one or the other.

15,190. I suppose if either party could make a claim before a certain day it would not matter, in your opinion, if the claims were made simultaneously?—No, but then you see the advantage of postponing the time of giving notice of claim is that each party will know what the other party is going to claim, the tenant will know what the landlord is going to counter-claim for; of course I am presuming they will have met and tried to agree, therefore each party will know at the time of giving notice what the other is going to claim for.

15,191. Unless they are simultaneous one party must be behind the other?—I am assuming there has been an attempt to settle before the time of sending in the claim. As soon as the tenancy is over the landlord and tenant will come together and try to settle the compensation and they will each tell the other what they claim for.

15,192. You think that it would lead to a simplification?—I am sure it would.

15,193. You do not think it would increase the delay?—No, not a bit, because two months always elapses now before anything is done.

15,194. Is that necessary?—It is not necessary, but the parties are never ready.

15,195. I suppose the inspection of the farm must be made at the time of the termination of the tenancy for the valuation of things such as crops and cultivations?—It should be, but the formalities are never completed in time for that.

Arbitration.

15,196. I do not quite understand your position with regard to the single referee under the Act—is it that the parties might agree to submit to a single referee?—Yes.

15,197. You do not want it to be made compulsory that they should so submit?—No, I say that it would be better for them if they should and I should like to see it more generally adopted.

15,198. Mr. Elton asked you if you would like to see the powers of the General Arbitration Act applied in this case, that would be raising a presumption that one referee should settle the case, but leaving to the parties the option of proceeding by two?—That is how I understood the question.

15,199. That is your view?—Yes, that is what I understood the question to be.

Sanitary rate.

15,200. About the sanitary rate, it would not be so much the amount of the rate that you objected to, I think, as the principle?—Yes.

15,201. I think you said that if you had a cluster of cottages the sanitary authority thought itself bound to take measures to drain and to supply water to them, whereas a farmer or a landlord was left with a single farmhouse to do all that at his own expense?—Yes.

15,202. And that a farmer who was miles away had to pay for drainage and for sewers that could be of no possible benefit to him?—That is so.

15,203. And generally you think that the capacity of the farmer to pay rates is not so great in proportion as the capacity of the tradesman?—I am quite sure that it is so in our district.

Compensation.

15,204. (*Mr. Clay.*) You said, I think, that you would give in your scale of compensation to the Commission?—Yes.

15,205. Are the valuators paid generally by the landlords?—As a rule the umpire says each party pays his own costs.

15,206. In valuing farms are you paid by the landlord or by the tenant, or jointly?—Do you mean for letting?

15,207. Yes?—It is part of the agent's duty to value a farm without any extra payment when it is to be relet.

15,208. That is for the landlord?—For the landlord.

15,209. And, of course, naturally you fix the rent if anything in the landlord's favour?—No, I will not say that because my instructions are that I am not to get the full value, I am to be under the full letting value and therefore I value accordingly.

15,210. Are those the general instructions do you think?—I am speaking with regard to this particular estate.

15,211. I am dealing with the case as a whole?—It depends upon the landlord entirely as to what his instructions are, landlords vary.

15,212. So that generally two instructions go out?—Likely enough.

Mr. F. Punchard. 5 Apr. 1894.

Claims and counter-claims.

15,213. I think you said that a landlord should have an extended time to make his claim?—You must either do that or else you must give him the power to set the Act in motion, one or the other.

15,214. I think you have admitted that the claims should be made simultaneously?—Yes. You do not know when the tenant is going to put in his claim.

15,215. The Act fixes a time for putting in the claim?—Yes, two months before; but it does not say to a day or a week, or it may be three months before if you like.

15,216. You say, I think, that it should be two months after the tenancy?—Yes, after.

Arbitration.

15,217. Both landlord and tenant should put in their claim then; how would you have the appointment of the referee?—By the respective parties; let them agree upon a single referee.

15,218. Would you not leave it to the county court judge?—No, unless they cannot agree, then let the county council appoint him. I would rather the county council than the county court judge. I have no faith in county court judges. If the parties cannot agree, and they choose to go to the county council, then I see no harm in the county council appointing a single referee.

15,219. Would that not be making the appointment come through that body, the county council?—I should see no harm in it; that is, if the parties cannot agree otherwise. If they do agree there is no necessity to go to the council.

Rent and prices.

15,220. You said that the tenants should have three rents; have they been having three rents these last 10 years?—I would not like to say. I have not seen their accounts.

15,221. What is your own opinion?—My own opinion is that they have not.

15,222. The rents must be too high then?—No, only in some cases.

15,223. In an average of cases?—No. I will not say even on an average of cases, because, mind you, the rents have been coming down as well.

15,224. Have the rents fallen in sufficient proportion to the fall in the price of the produce that they sell off the land?—Yes, in a great many cases they have. Rents have fallen from 30 to 50 per cent. in a great many cases, and that is quite equal to the depreciation in prices, quite equal. I think both parties have divided the loss.

The Law of Distress.

15,225. Regarding the law of distraint, you say that the landlord gives credit to the tenant for perhaps one or two years?—He will not often do that, but he has the power to do that of course.

15,226. Do you think that the trader has anything to say to that?—I do not think it matters to the tradesman at all what the understanding is between landlord and tenant.

15,227. Certainly it matters a good deal to the trader; if the landlord has his 20*s.* and the trader who supplies the material for carrying on the farm has only to look to a dividend, how do you reconcile that?—In the case of a bankruptcy the landlord only gets six months' rent.

15,228. I suppose they can go for twelve months?—Under the Act, if there is sufficient to do it; but if there is a bankruptcy before the distraint is put in the landlord would only get six months'.

15,229. But, then, has he any right even for the six months above the general trader?—Yes, I think so, because he cannot stop his debt in the way the trader can.

15,230. Can the trader stop his debts?—Yes.

15,231. By making the farmer bankrupt?—The moment the trader has any reason to doubt his customer's financial position he can stop his debt; he can say, "I will not let you have any more," but the landlord cannot do that.

15,232. The trader has lent his money through the material he gave the tenant; has he not, therefore, the same claim as the landlord has for six months' rent?—I do not think he has, quite.

15,233. Where is the difference? Take a point. Let us have that defined?—I would not like to say.

15,234. It is very simple, is it not; the landlord has given six months' credit to the tenant, and the trader has given perhaps 12 months' credit for cakes, manures, and seeds to carry on the farm; the landlord is only dealing with his interest, but is not the trader dealing with his capital?—Yes; but the trader is making a bigger profit than the landlord is.

15,235. Are you sure of that sometimes?—Quite sure.

15,236. Is not the tenant in the one case dealing with the trader's capital, whereas in the other he is only dealing with the landlord's interest?—And the landlord's capital.

15,237. No; is not the rent the interest on the land?—I am afraid a bit of his capital is going too.

15,238. Is not the rent he is receiving for his farm the interest on the land?—Yes, it should be.

15,239. What is the trader's capital but the money he has put into his business? Is not both his capital and his interest in his stock?—Not the capital altogether; it is more profit than capital.

15,240. We have had evidence here that some of the traders only get a penny in the pound; in such a case the trader loses both his interest on his money and his capital, does he not?—We have not had cases of that sort.

15,241. There are plenty of cases every day?—We have had no case in our district.

15,242. Are the trader's capital and the landlord's interest on his land on the same basis?—No, I think the landlord is entitled to his rent first within the limit which is laid down, which is six months in the case of bankruptcy and 12 months under the Act. I think he is entitled to that, because as I say he cannot stop his debt in the same way that the tradesman can stop his debt.

15,243. How can the tradesman stop his debt?—He can stop it accumulating; the landlord cannot.

15,244. But can he stop the money that has been drawn out into his manure and cakes and seeds—can he stop that?—No, but he can stop that getting more, whereas the landlord cannot stop the rent getting more.

15,245. Cannot the landlord give the tenant notice to leave?—He must wait until his quit notice expires before the rent stops.

15,246. That only lasts for six months, does it not?—Six or twelve months; it depends upon the conditions and the time of the year.

Claims and counter-claims.

15,247. (*Viscount Cobham.*) If the landlord and the tenant send in their claims on the same day would that not have the effect of largely increasing the number of landlords' claims as compared with the present system?—No; I think in the majority of cases they would be settled before the time comes on for giving in the notice.

15,248. Unless a claim be sent in under the Act the landlord cannot counter-claim now?—No, he cannot.

15,249. Would he not, under your suggestion, in order to protect himself, as a general rule lodge a claim?—That depends on how you are going to alter the Act. If you are going to fix one day for both parties to send in the claim then you must give the landlord the option of setting the Act in operation; but if you give him the same extra time that the Act now gives, and put him in the same position, then it is all right. At present you know he has got a fortnight after the termination of the tenancy within which he must send a counter-claim in.

15,250. It surely must tend to increase the number of landlords' claims. At present a number of proceedings under the Act are stopped altogether by the fear of the landlord's counter-claim?—Yes, that depends upon the way in which the Act is altered. I would still give the landlord so many extra days within which to send in his notice after the tenant has put in his. I would not give the landlord the right to set the Act in operation, unless the tenant sent in his claim first; but if the tenant does set the Act in operation then I say the landlord should have a little extra time to put in his claim, otherwise it would not be workable.

The fixing of rent.

15,251. You say that experience has shown that many farms have been taken at more than their proper value, and that rents have been fixed too high in many cases?—Yes.

Mr. F. Punchard.
5 Apr. 1894.

15,252. Should you not say as a land agent that it is becoming increasingly difficult to put any accurate value upon a farm?—I think it is almost as much the fault of the farmers as of anybody else, because when a farm is to be let by tender, they will always bid more rent.

15,253. If competitors for farms put too high a value upon the farms themselves, it is a certainty that the landowners and agents will take the same view?—Of course we have to do that. We have to ascertain the market value by this system of tender, and if we find that six or eight farmers put the farm at say 10 or 15 per cent. more than we do, we have to come to the conclusion that we are too low.

15,254. To revert to what I said before, do you not consider it a matter of much greater difficulty to accurately value a farm now compared with the times before 1879; is not the position much more uncertain, and are not the prospects much more uncertain now than they were then?—Certainly; it is very difficult to value when prices keep on going down, very difficult; but when prices are going up it is easier.

15,255. And the personal qualifications of tenants and their capital are now matters of much greater importance than they were in the good times?—Yes, certainly. You have to judge by your man.

15,256. It is difficult, is it not, to accurately gauge a man's intelligence or his capital when he offers for a farm?—Yes; but we generally take care to know something about the man before we let a farm to him—if he is a stranger to us, we make inquiries about him and his position.

15,257. But you make frequent mistakes, I should think, in the amount of a man's capital?—Yes; we get deceived in that sometimes.

Land Improvement Company's rentcharges.

15,258. I see from this table that the net rental that you get, taken in the last few years, which I suppose are fairly representative years, comes to more than 70 per cent. of the gross income; is that so?—Yes; but then that does not include or take into account the Land Improvement Company's rentcharges which happen to be a very large sum. We are paying 5,000*l.* in rentcharges to the Improvement Company.

15,259. Does that not come into this return at all?—No.

15,260. Are fresh loans being made?—There has not been any for two or three years now. They begin to die out in 1895, and then the last of them dies out in 1910, I think, or something of that sort.

15,261. Can you state what is the payment this year?—It is 5,210*l.* I think.

15,262. Would the net rental be taken after paying for the up-keep of the house and garden?—No. I have not included that.

15,263. That has to be done out of the net rental?—Yes—I have not included that, and I have not included game-keepers—only the expenses necessary to maintain the estate.

15,264. Should you say as a rule that a landlord who is not burdened with charges, would be fairly well off if he gets half his gross rental to spend?—He would be very well off if he gets half his gross rental in pocket.

Mr. F. Punchard.
5 Apr. 1894.

Small holdings.

15,265. (*Sir Nigel Kingscote.*) You have a large number of small holdings on the Underley Estate; do the tenants of those holdings follow any other occupation or not?—No, very few of them. I am excepting those of course, that are under 5 acres; there are 62 under 5 acres—that is small accommodation land near the town—I am excluding them; but I am taking the 20 to 50 acres.

15,266. They live almost exclusively on the land?—Yes.

Wages.

15,267. You said the wages have gone down during the last 10 years; have the wages of the carpenters and bricklayers, the people who have to do the repairs and building on the estate, gone down?—No, they are the same as they were 10 years ago.

15,268. Therefore, as regards the landlord's pocket, has it been rather dearer to them to put up buildings and to make repairs than it was before?—It has been no cheaper to do these things.

Cattle diseases.

15,269. Have you suffered in your neighbourhood in past years from cattle diseases?—Very little. We had very little of the foot and mouth disease when that was about.

15,270. I suppose you have no strong opinion then as to whether all cattle ought to be slaughtered at the port?—No, it does not affect us at all.

Sale by live-weight.

15,271. Is the weigh-bridge used at your markets for cattle and sheep?—No, unfortunately not. I would like to see it more used; but it is not used.

15,272. Do you think it would be to the benefit of the farmer if it was more used?—I think so.

Compensation for improvements.

15,273. (*Mr. Channing.*) In cases where you and other valuers have awarded additional compensation for high continuous farming, has there been any protest against that award, or any threat of carrying it to a higher court, or anything of that kind?—No, there has never been any appeal from it. The landlords always accept the awards, except at the beginning. At the beginning there were certain legal questions which arose, and it was necessary to go to the county court to get a legal definition of the terms in the Act; but now that we have got it a case never goes to a court.

15,274. So that we may take it that it is an established custom now of valuation that where a man has farmed very highly for a number of years he gets some additional compensation in your district?—I will not say that it is an established custom, but it is a growing custom; it is a custom that I have been trying to introduce and have been fighting for.

15,275. And it is not seriously challenged?—That is so.

Arrears of rent.

15,276. (*Mr. Lambert.*) Is it not an overwhelming disadvantage that a tenant should get into arrears with his rent?—I do not know that it is. I think he goes on hoping against hope.

15,277. Is it not a great disadvantage to him?—I do not think so. I think very often it is an advantage to him to have a little credit.

The witness withdrew.

Mr. J. W. Broughton.

Mr. John William Broughton called and examined.

Mr. J. W. Broughton.

15,278. (*Viscount Cobham.*) You are a land agent and surveyor in the Skipton District of Yorkshire, I believe?—Yes, I am.

15,279. Are you a farmer as well?—No, I am not a farmer.

15,280. Then you have not had any practical experience of farming?—Yes, I have had some little experience.

15,281. The district that you wish to speak of comprises most of the Skipton and Settle Unions?—Yes, practically the Skipton Parliamentary Division, but principally the Skipton and Settle Unions.

15,282. That district comprises two or three large valleys or dales, I presume?—Yes.

15,283. Wharfedale?—Yes, and Airedale, the upper parts.

15,284. Is the land that you are going to speak of mostly land lying in the valleys and on the slopes of the hills?—Yes, on the hill sides, the mountains, and in the valleys.

Size of farms.

15,285. How large are the farms as a rule in that district?—A large farm is about 500 acres, and they come down from that to about 50 or 60 acres.

15,286. When you speak of 500 acres, do you mean that to include a run for sheep on the mountain?—No.

15,287. As a rule do they have mountain runs?—Some of the estates have what they call sheep gates, 40 or 50 sheep gates to a farm.

15,288. Common rights?—Yes.

15,289-90. What would be an average sized farm in the district?—200 or 300 acres.

Produce of farms.

15,291. What do they chiefly produce?—They breed cattle and sheep, they produce butter, they produce beef, and they produce mutton.

Mr. J. W. Broughton. 5 Apr. 1894.

15,292. Almost wholly from grass land?—Yes, I may say wholly from grass land. I do not think that in those two unions there is above 20 acres of arable altogether.

Tenure.

15,293. Under what tenure do they hold their farms?—Under the yearly tenure, they are all nearly year to year tenants.

Present position of the farmers.

15,294. Can you tell us what is the present condition of these grass land farmers?—The condition of the grass land farmers is that their capital is very much reduced, and that some few are pretty well bankrupt. I may say that their capital is reduced; that is the actual position of them.

15,295. They share to the full in the prevailing depression?—Yes.

15,296. When should you say that that began with them?—About 1878.

Reductions of rent.

15,297. What has been done to meet the depression?—From 1878 to about 1887, a very bad year, the proprietors met their tenants by reductions of about 10 to 15 per cent., after that forward they have had to make permanent reductions of about 20 per cent. up to now. I think the reduction now is about 20 per cent. on the rental of 1878.

15,298. Should you say that 20 per cent. is the maximum reduction?—I think it is about the average.

15,299. What should you say is the maximum reduction in cases that you are acquainted with?—There is one estate of which I have knowledge which was put up to the full of its value in about 1875, and it is now reduced about one half.

15,300. Fifty per cent. in fact?—Yes.

15,301. What are the rents at present of good average land in Skipton and Craven?—I have various farms on a list here with the acreage and rent.

15,302. Will you quote some representative cases?—There is one farm with a rent of 650*l.* in 1878, now 475*l.*, its size being 430 acres; there is another with 480*l.* rental in 1878, now 380*l.*, 240 acres; there is another, 514*l.* in 1878, now 350*l.*, 212 acres; there is another, 360*l.* in 1878, 310*l.* in 1894, 294 acres. On another estate belonging to the same proprietor, which is close to the larger towns and close to a railway station, 142*l.* in 1878 and 134*l.* in 1894, the acreage being 98. There is another farm adjoining that which is at the same rent as it was in 1878, 66*l.* a year for 45 acres. I can give you more instances of different classes of farms if you think necessary.

15,303. But those are fairly representative cases, I presume?—Yes, I think they are.

15,304. Do you know of much grass land that rents for less than 1*l.* an acre?—The higher lands rent for less than 1*l.* an acre.

15,305. The hill land?—Yes, the hill side lands—lands which grow ling or heather are from 5*s.*

15,306. I am speaking of old grass lands?—Well, they are let from 12*s.* to 15*s.* an acre, according to valuations that I have made.

15,307. In what way were the farmers particularly affected by the depression after 1878?—It has simply reduced their capital.

Fall in prices.

15,308. How did their losses arise?—Their cattle have fallen in price by about one-fourth since that time, sheep about one-third, wool has fallen from about 2*s.* to about 8*d.*, and butter which got up at one time to about 2*s.* per lb., I remember, now is about 1*s.* 3*d.* or something like that—1*s.* 2*d.*, perhaps.

Cattle diseases.

15,309-10. In addition to that have you suffered very much from cattle diseases?—Not to any great extent, except pleuro-pneumonia, for which they have been compensated.

15,311. Sheep rot?—They have suffered from that considerably—the flock masters, the sheep farmers lost a good deal of money by the fluke.

15,312. And resulting from pleuro-pneumonia there was a considerable stoppage of the markets of course?—Yes.

15,313. Had that a permanently bad effect?—I do not know that it had a permanently bad effect—it had a bad effect for a time, but I cannot say that it had a permanently bad effect. I think they got together again without any trouble after the restrictions were taken off.

15,314. The consumer and the producer got together again you mean?—Yes, after the restrictions were taken off. It affected them, temporarily, of course.

Mr. J. W. Broughton. 5 Apr. 1894.

Vacant farms and changes of tenancy.

15,315. Have many farms become vacant?—There are no farms lying vacant now. There have been considerable changes of tenancy.

15,316. Have many farmers lost their capital and been obliged to go?—Not very many; they have generally stuck to the land and are sticking to it now, although many are practically without money, in the hopes of better times.

Deteriorated cultivation.

15,317-19. Is there a much diminished outlay of tenants' capital on their farms compared with the time previous to 1878?—Yes, in the way of labour more particularly. They used to have lime provided by the proprietor which they carted on to the land and spread, and other sorts of manure. There has been nothing of that done lately; in fact, there has been practically very little improvement done by the farmers since that time.

15,320. So that the land has deteriorated to some extent?—The land is deteriorating, no doubt.

Expenditure on improvements.

15,321. That would be partly owing to the landlords being crippled as well as the tenants, would it not?—Yes, although the larger proprietors or landlords in our neighbourhood are very fairly liberal with regard to improvements, and lately they have begun to provide shelters for the sheep in the lambing season, and so on.

15,322. Are the buildings generally well kept up?—Pretty well, on the whole.

Reductions of rent.

15,323. Do you apprehend a continuance of the fall in rents?—I do not think they will go down very much further. I think in some instances they have got down to the bottom; in other cases they will come down a little further I do not doubt.

15,324. Then you think that if the present prices continue that would not necessitate a still further fall in rents?—No. If we have a year as good as last year we should maintain what we are getting now.

15,325. Last year was a good year for you?—A fairly good year, not a bad year at all.

15,326. I suppose it seldom happens that you have too dry a summer?—Very seldom indeed.

Expenditure on improvements.

15,327. Speaking of the landlord's outlay on buildings and repairs, does it fall more heavily upon him than it did?—Labour is more costly now by about 10 per cent. than it was in 1878—masons, bricklayers, and that class of workmen are better paid now than they were then, and farm labourers are also better paid.

15,328-30. Then the demands upon landlords show no signs of diminishing?—On the contrary, there is an increase.

Reduced labour.

15,331. Are fewer farm labourers kept than formerly? Has there been a saving in that respect?—I think very little, there is not much difference with them: they do not require very many men; I give you an instance; a farm of 475*l.* a year now with 430 acres; there would, perhaps, be kept two men and a lad on that farm, nothing more.

15,332. Then the farmer's families work on the farm as a rule?—Yes, they do.

15,333. Would they be paid wages, or would they be just kept?—Just kept as a rule; they would not be paid wages.

Large and small farms compared.

15,334-5. The result of that would be that on the smaller farms on the whole the tenants have held their own better than on the larger farms where they are more affected by the increase of cost of labour?—I do not know. I think the larger farmers in our neighbourhood have the cheaper holdings. The medium farmers as a rule are now almost without capital, I should think.

Wages.

15,336. What is the current rate of wages for an ordinary farm hand?—The current rate is from 20*l.* to 40*l.* a year. A good man will get 40*l.* a year.

15,337. And be boarded?—And be boarded as well; he will live in the farmhouse.

15,338. He will be a waggoner or a cowman?—Yes, a cowman and shepherd really—a man to look after the stock. A man at 40*l.* a year has a thorough knowledge of stock and knows how to look after and wait on them.

Tithe.

15,339. Has the tithe rentcharge as a rule fallen as an additional burden upon the landowner?—It has.

Mr. J. W. Broughton. 5 Apr. 1894.

15,340. He has taken it over and not got it back?—Yes; the tenants cried for a reduction and as a rule the landlords just reduced them by the tithe after the Act of 1891.

15,341. It has taken the place of a reduction of the rent?—Yes, and now it is a total loss to the landlord in very many cases.

Rates.

15,342. I suppose you would say in the same way that if there is a division of rates between landowners and tenant the same process very likely would take place in that event?—Yes, it looks so at present, unless times mend.

15,343. But still if a reduction of rent is necessary it does not very much matter to the landlord whether it takes the shape of his taking over some of the tenant's burdens, or giving a direct remission of rent does it?—No; but really in many cases the tenants do not seem to know the value of a farm. Many tenants who go on to a farm do not reckon the tithe until they get on to the farm, then they begin to see that it is a burden.

15,344. That was so formerly, but of course that impression does not arise now as they have not to pay it?—That is so.

15,345. You say in your brief that you think the division of rates will lessen the landlord's income. I do not quite see how it is to do that directly?—If a landlord gets once saddled with these things, they seldom get off his shoulders, that is all.

Importation of live stock.

15,346. Do you consider that the conditions of the importation of foreign live stock operate a good deal to the disadvantage of the tenant farmers?—Yes, they say so.

15,347. You mean, I understand, in the uncertain nature of the importation?—That has more to do with it than anything else, owing to the intermittent opening of the ports they do not know what will be the value of their stock in the autumn. They buy on in the spring expecting to realise a profit, but the ports will then perhaps be opened for live stock from Canada, causing diminished prices. Cattle here are brought on to the large pastures in spring to be sold off in autumn for further feeding.

15,348. It imports a great deal of uncertainty in fact into their business?—Yes, there is no doubt about that.

15,349. You say it is difficult to foresee prices?—There should be at least three months notice given before a port is opened.

15,350. (*Mr. Lambert.*) The ports have been shut for a very long time now, very much longer than three months, they have been shut for the last three or four years?—Yes.

15,351. (*Mr. Chaplin.*) You mean, do you not, that there should be three months' notice of their being re-opened?—Yes, that is what I do mean.

15,352. (*Viscount Cobham.*) Is it the opinion of farmers in your district that live stock importation should be stopped?—It is; they think that they would be able to do better if it were so, and that it would prevent disease.

15,353. Do they breed their own cattle for the most part?—There are a good many breeding farms in our neighbourhood.

15,354. Do they buy much lean stock from other parts of the country?—Yes, they do a great quantity, at this time of the year they are buying on to the large pastures.

15,355. Do they not buy Canadian store stock?—Yes, they are very willing to buy if they could now.

15,356. But they would be very willing to give up that advantage in order to put an end to the importation of live stock?—Yes, the farmers in our neighbourhood are afraid that the ports will be opened in the autumn to compete with them. That is really what they are afraid of. They do not know whether the ports will be opened or not and of course they do not know what price to give for the cattle now, there is no surety for them to realise a profit.

15,357. Do you see any mode of meeting the stress of foreign competition in cattle and sheep, or do those on whose behalf you are speaking? I suppose you are speaking the general opinion of your neighbourhood?—Yes, the general opinion of my neighbourhood.

Slaughter of foreign cattle.

15,358. What is the opinion?—Their opinion is that all imported cattle should be slaughtered at the ports—that is all.

15,359. There is no great demand for other protective measures?—They go in for protective measures; but of course, as far as I am concerned, I do not expect that they will ever come. I may say that three-fourths of the Council of the Craven Agricultural Society, of which I am a member, would go in for a protective duty. I do not say that on my own account.

Mr. J. W. Broughton. 5 Apr. 1894. Protection.

15,360. Would you say that is the case with people of all political opinions?—The landed interest and the farmers in our neighbourhood are pretty well of one political opinion on that point.

15,361. They are protectionists for the most part?—Yes, they are.

The Agricultural Holdings Act.

15,362. Can you tell us anything of the working of the Agricultural Holdings Act of 1883?—I know very little about it.

15,363. It is a dead letter, is it?—It is not much used. We do not use it in our agreements. We do not have any scale or anything of that sort in agreements. In fact there is so little improvement done that there is no need for its use. When used always, so far as my experience goes, the cases have been settled amicably.

15,364. Is there a prevailing custom in the district?—What for?

15,365. For compensation to out-going tenants?—No, I do not think there is any particular prevailing custom for compensation.

15,366. There is no arable land?—There is no arable land practically.

15,367. Then it is a very simple matter compared with what it is elsewhere?—Yes, it is a very simple matter.

15,368. There is no feeling of grievance or of insecurity with regard to their outlay upon their farms?—None at all, I think.

Technical instruction.

15,369. Has the county council done much for technical education in your district?—The county council have given us travelling dairy classes and also lectures on agriculture, which the schoolmasters, I think, have principally benefited by. They have gone to Leeds to have these lectures administered to them.

15,370. The result of that will be felt hereafter, it is hoped?—Yes.

15,371. As to the dairy classes?—As to the dairy classes, the young women who have gone to the classes have benefited materially from them, there is no doubt about that, but the older people do not seem to take them up with any degree of pleasure.

15,372. Was the butter-making of a primitive character previously?—Yes, to a great extent.

15,373. They are learning improved methods?—I think they are learning improved methods through the dairy classes.

15,374. Have they attended the classes well?—Yes.

15,375. I mean the people for whom they were intended?—Yes, thay have.

15,376. Farmers' daughters and wives?—Yes.

15,377. Have they succeeded in getting well qualified teachers?—Yes, they have, very well qualified.

15,378. Have you any suggestions to make for the further development of agricultural education?—No, I do not know that I have, except so far as lectures go.

15,379. Have they had lectures on the treatment of stock and the management of pastures?—They have had some lectures, but not very many; they might with advantage continue those lectures on that and also on horse-breeding, I think.

15,380. Have they been as successful as the dairy classes?—I think not.

The making of roads by tenants.

15,381. You have some peculiar local burdens, have you not, which you think may be reduced, such as the maintenance of *ratione tenuræ* roads by tenant farmers?—Some farmers in our neighbourhood have to make public roads through their lands or farms, and also to pay the usual rates as well, which we consider to be a burden upon the land and very unsatisfactory altogether. It should be done away with.

15,382. They have to make the roads?—Yes.

15,383. In the first instance?—Yes.

15,384. Any new roads have to be made by the farmers?—I am not speaking of new roads at all.

Mr. J. W. Broughton. 5 Apr. 1894.

15,385. They have to maintain them, you mean?—Yes, they have to maintain them.

15,386. And to pay the general highway rate?—To pay the general highway rate as well.

15,387. These roads that they maintain, are they public roads?—Public roads.

15,388. No matter what the traffic may be upon them, the frontagers have to maintain them?—Yes.

15,389. Of course, it ultimately falls upon the landowner?—I think when a tenant takes a farm he does not think very much about that, and so it really falls as a burden upon the tenant. He takes the land at its value, and does not consider in his taking anything about the road perhaps; it is very often so.

15,390. Is it a heavy burden in many cases?—Yes, rather. They very often have to be summoned for not maintaining. I have been employed by the magistrates once or twice on such questions to make reports. There is a road which runs from Skipton to Colne which is very much used—more used than any highway, I should think, in our neighbourhood—and the tenants through whose farms that road passes have to make the road, and they have to maintain it.

15,391. Is not that a main road?—It is a public road.

15,392. But not a main road?—No, it is what we call *ratione tenuræ*.

15,393. Do not the counties take over the main arteries?—In most cases they do. This is an old institution.

15,394. That road is one of the chief roads of the district, is it not?—Yes, it is. It is not the whole of the road from Skipton to Colne; it is only part of it. The very part I am speaking of now is the part from Earby to Kelbrook.

15,395. Supposing there is a great excursion traffic over it in the summer, the cost of that falls upon the tenant farmers adjoining?—Exactly so.

15,396. I suppose the County Council does not choose to take over these roads?—That is it. In one or two cases the proprietor who has farmed his own land has bought himself out—has bought his liability away.

15,397. One can hardly think that farmers can be so ignorant of the conditions of the farm they are competing for that they should not take that into consideration?—It is a hardship to a landowner in any case to have to make his road and pay his rate when it is a public road like that which I am speaking of.

Rates.

15,398–9. As to the ordinary rates, have they increased, or are they stationary?—I have not any statistics here, but the poor rates have gone down a little. The county rates have gone up a little.

15,400. On the whole, is there more paid in respect of rates now than there was 10 years ago?—Not very much; there is a little more.

Railway rates.

15,401. Have you any further suggestions to make for enabling the British farmer to meet competition—as to the cost of carriage, for instance?—I suppose the conditions will equalise themselves before very long so far as that goes, but certainly there was a grievance felt by our cattle dealers and farmers because they were paying more railway rates from the ports than the foreigners were, which is certainly a grievance.

15,402. Notwithstanding the Act of Parliament?—Notwithstanding the Act of Parliament. The Act of Parliament made short distance journeys for the farmers—it affected the farmers more than the cattle dealers—more costly than they were previous to the Railway Rates Act.

15,403. The Act of Parliament also provided that no preference should be given to foreign imports as such over home produce. Perhaps farmers do not know that; we have had evidence from other witnesses that there is a good deal of ignorance on that point?—They seem to think that they are paying more. Of course I am not speaking on my own account now. I do not know particularly about that.

Rents.

15,404. Do you consider that the outlook is at all hopeful; do you see any break in the clouds?—We consider that we have got down to about the bottom value again—we have got down to about the value of the rentals as they were before the Franco-Prussian War, which sent the rentals in our neighbourhood up to a fictitious value. They increased from that time up to 1878, and now they have got down again to the old level.

Mr. J. W. Broughton. 5 Apr. 1894.

15,405. Would the farmers benefit much by a general improvement of the trade of the country if that should take place?—No doubt they would.

15,406. Do you say from experience that that has been so?—Yes; the prices diminished a little at the time of the great coal strike, which affected our beef and mutton trade a little.

15,407. Did it immediately affect the price of local meat?—Yes.

Sliding scale of rents.

15,408. Have you any further suggestions to offer in the direction of legislation for the benefit of agriculture?—I have a note here that a sliding scale would in some cases be useful. I do not know whether that would obtain or not, I am sure.

15,409. A sliding scale of rents?—Yes; it would have to be ruled in our neighbourhood by the prices of beef, mutton, and butter.

15,410. Is that regarded with favour by the farmers?—Yes, I think so. I do not say that a sliding scale is favoured, but in some cases I suggest that it would be useful as used, for instance, in the Tithe Acts.

15,411. Do you think it would be quite feasible?—I see no reason why it should not.

15,412. Based upon the prices of dairy produce, beef, and mutton?—Yes.

15,413–14. Therefore a much less complicated calculation would be involved than in the case of an ordinary mixed farm?—Exactly so.

The marking of foreign meat.

15,415. Are you in favour of marking foreign meat?—Yes, I am distinctly.

15,416. In what way?—Naturally the consumer would buy English meat and give more for it than he would for foreign: as it is he does not know what he is buying.

15,417. How would you mark it; do you think every joint can be marked?—It should be, I think.

15,418. You have not weighed the practical difficulty of it?—No, I have not.

15,419.—Generally you are in favour of the marking of foreign meat?—Yes.

15,420.—And the buyer knowing what he is buying by some means or other?—Exactly so.

15,421. Are the beasts sold by auction as a rule in Craven, or how are they disposed of generally?—There are two auction marts in Craven, but they are principally disposed of in the open streets in Skipton Market.

Sale by live weight.

15,422. Is there any selling by live weight?—In the Skipton Auction Mart they have a weighing machine, but I do not think they often weigh. They do not give the weight when they are selling, at all events.

15,423. Do not the farmers see any advantage in it?—They do not, but they ought to. There is no doubt the butcher is a better judge of weight than the farmer.

15,424. Very little use has been made of the weighing machine then?—Practically none.

Repairs to buildings.

15,425. (*Sir Nigel Kingscote.*) Do the tenants in your district do their own repairs to their own buildings chiefly?—No, they do not.

15,426. The landlord does everything?—The landlord does the repairs to the buildings.

15,427. Has that been the case for some time?—Yes.

Restrictions in agreements.

15,428. Are there any restrictions as to cropping?—Yes. A farmer may not break up land for ploughing under a penalty of 10*l.* per acre; but at the same time the landlords in our neighbourhood have no objection to a tenant breaking up four or five acres without paying anything extra; they never have paid extra so far. But as a matter of fact, they have only begun this last four or five years to break up for ploughing.

15,429–30. (*Viscount Cobham.*) Good old pasture you are speaking of?—Yes; some farmers have begun to plough four or five acres for their own particular use—for oats and turnips.

15,431. (*Sir Nigel Kingscote.*) Is your district entirely grass land?—Yes; it is entirely grass land. There are three or four farmers that I know of particularly who began to plough these few acres for their own use—to save the miller's bill as a matter of fact.

15,432. I understood you to say that you would wish to see all foreign meat marked?—Yes.

15,433. Would it meet your views if everybody who sold foreign meat was licensed without the marking?—Licensed to sell foreign meat?

15,434. Yes?—No, I think it is best to be marked. I think the customer should know what he is buying.

15,435. You know there are great difficulties in that; I think you told Lord Cobham that you saw great difficulties in marking every joint?—No doubt there is some difficulty.

15,436. (*Mr. Giffen.*) You told us, I think, that rents have been permanently reduced in many cases and mostly fully 20 per cent.; and then you went on to say that the rents are still falling, and that the probabilities point to having reductions still?—In some cases.

15,437. Is that because of an opinion which you have that further adjustments of rent are necessary to meet the present prices?—Yes, I think there are some of the farms pretty high yet, and that they will have to come down, but the great majority I think have reached the lowest level.

15,438. And that is on the basis of present prices?—Yes, present prices, or rather I should say according to last year's.

15,439. In making this statement you are not anticipating a further fall of prices?—In what?

15,440. In the prices of produce?—No.

15,441. It is entirely with reference to existing prices?—Yes.

15,442. You are of opinion, I think, that buildings and repairs which fall upon the landlord are more costly now by 10 per cent. than in 1878. Do you mean the same buildings or the same repair which is done now would cost more by 10 per cent. than it would have done in 1878?—Yes. For instance, the ordinary estate labourer who would get 17*s.* or 18*s.* a week in 1878 will get now 20*s.* and 21*s.*

15,443. Then it is not really that the landlord has more repairs and improvements to do, but that the same repairs and improvements cost him more than they did in 1878?—Yes, they do.

15,444. Then I see in your proof that you are of opinion that times of depression always have been and will be, and you rather look to the turn of the wheel for improvement than to anything else?—Yes, I think so.

15,445. Does your experience and observation go far back with reference to times of depression?—My own experience is not very long as you may imagine. It is about 10 years' experience. But I have been on an estate all my life, and I have been in large estate offices all my life more or less.

15,446. That is the tradition of the office?—Exactly so.

15,447. That there are long cycles of years one way and long cycles another way?—Exactly so.

15,448. (*Mr. Gilmour.*) Would the sliding scale that you propose really cover, in your opinion, all that was necessary in forming your rent, in giving you a true basis as to what the rent should be in your country?—Yes.

15,449. Is your country a horse-breeding country at all?—No, not very much. A farmer generally keeps one or two mares, and perhaps half of the farmers will breed one foal in the season. That is about all the horse breeding we do, but I think they might with advantage go in for horse breeding, and it is generally thought so by the gentlemen and landed proprietors in the neighbourhood too, and some of them are taking it up a little more just now.

15,450. Has it been increasing of late years?—Not very much.

15,451. Do you get the benefit of a premium thoroughbred stallion in that part?—No.

15,452. And no demand for it?—No.

15,453. Then in your opinion there is almost nothing, except horse breeding perhaps, that the farmers might branch off into beyond the work that they are at present engaged in?—I think not, except a little cultivation; they might go in for cultivation just for their own purposes, and, as I said before, to save the miller's bill.

15,454. Would they do that in the face of what they must notice, that those who have arable farms are laying a very great deal down to grass?—Yes, I think they would.

15,455. On what ground?—It seems to be an advantage to those who have done it. You see straw is pretty dear; they might just get as much straw as they want. Then as to turnips, they send hundreds of sheep out of our neighbourhood on to turnip lands, and they might as well save that by putting them on to their own grown turnips. They send them away up to the east coast principally.

15,456. That would change their style of farming altogether?—Not altogether; they would simply turnip their own sheep instead of sending them away to turnip.

15,457. How do they winter their stock at present?—They do not winter very much stock. It is really a summer district.

15,458. They buy in the spring?—They buy in the spring, summer it, and sell in the autumn.

15,459. (*Mr. Chaplin.*) They buy a number of the dry cows from the dairy districts, do they not?—Yes, what they call laying off cows.

15,460. And then fatten them?—Not fatten them, they bring them round to calf, very many of them.

15,461. They do not feed them?—Some of the farmers have grazing farms, and they buy for that purpose in the spring, and sell off fat stock in the autumn.

15,462. With regard to the marking of foreign meat which you recommend, are you aware that a committee has just sat and examined into that subject, and made a report?—Yes.

15,463. Have you read their report?—I have not read it.

15,464. You are not aware of what their recommendations are?—No.

15,465. You are not able to say whether they meet your view then?—I am not.

15,466. Did I understand you to say that many farmers in the district were nearly bankrupt?—Well, they have lost all their capital—they have practically nothing; they go on by credit, and perhaps in many cases by borrowing at the bank.

15,467. At all events they are in a very bad way?—Yes, they are in a bad way. They are not in such a bad way as they are in the arable districts by any means.

15,468. However bad their condition, or comparatively better than other places, I gather that the drift of your evidence is this, that the real cause of the trouble is the fall in prices?—Yes, exactly so.

15,469. That is what lies at the bottom of it?—Yes.

15,470. And there can be no real remedy unless there be a rise in prices?—Exactly so.

15,471. Among the suggestions which you did make I understand you to say that what you consider to be of the most material importance of anything is that any live stock which is imported into the country from abroad should be slaughtered at the port of landing?—That is the feeling of the district.

15,472. Is that practically the unanimous feeling?—It is the unanimous feeling.

15,473. Are you aware that a deputation representing the Chamber of Agriculture and other representative bodies waited upon the Government, and represented their views upon the subject within the last few days?—Yes, I am.

15,474. Do you know what their views were?—Yes.

15,475. They would represent the views of the people on whose behalf you speak?—Yes, they do pretty nearly, exactly I think. I do not speak particularly on behalf of any class, I may say.

15,476. The object in view I understand being a double one; first, to prevent the possibility, as far as it can be prevented, of the re-introduction of disease?—Yes.

15,477. And in the second place to remove the uncertainty which this intermittent importation throws upon their trade?—Yes, that is the principal thing.

The intermittent importation is everything against the trade in Craven.

15,478. And the remedy that they propose for that is slaughter at the port in all cases?—Yes, or on the other hand to give three months' notice at the very least before a port is opened. I think I am very clear on that.

15,479. (*Mr. Lambert.*) Do you represent any Farmers' Club?—I do not.

15,480. What do you represent?—I am a member of the Council of the Craven Agricultural Society and Farmers' Club, but I do not represent them.

15,481. You describe yourself as a land agent, have you got a big estate in hand, or are you managing a large estate?—I manage a few estates, I am not exactly in partnership with my father, but we are closely in touch with one another, and he is agent for one of the largest estates, Sir Mathew Wilson's.

15,482. Is it all grass land?—All grass land practically.

Fall in prices.

15,483. How much do you consider that agricultural produce has depreciated?—Cattle have fallen one-quarter in value, and sheep one-third.

15,484. That would be from 25 to 35 per cent. would it not?—Yes, exactly. Wool has fallen from 2*s.* per lb. to 8*d.*

15,485. That is infinitely more?—Yes.

15,486. Something like 60 per cent?—Yes, that is a very great reduction.

15,487. How much is rent reduced?—About 20 per cent.

Reduction of rent and prices.

15,488. Can you give any reason why rent has only been reduced 20 per cent. whereas produce has gone down from 25 to 30, and to 60 per cent.?—I suppose the farms never get up really to quite top value.

Competition for farms.

15,489. Is there good competition for farms in your district?—Yes.

15,490. How many applicants would you get for a farm say of 150*l.* a year rent?—Probably about ten.

15,491. No difficulty at all in letting them?—No difficulty in letting.

15,492. Therefore it is probable having such competition that the land would be rented to its full value?—Do you mean now or when?

15,493. Now, or at any time?—Farms are not generally let by tender. In some cases they are, but on the larger estates they are not often let by tender.

Reduction of rent and prices.

15,494. So you think that the reason why rent has not depreciated to the same extent as agricultural produce is that farms 20 years ago were not rented high enough?—No, I do not say high enough, I said perhaps they were not rented up to their full value.

15,495. Then are they rented too high now?—I think that now they have just about reached the proper value, perhaps they will come down a little more yet.

15,496. So they are rented too high now?—It is rather a peculiar question to answer.

15,497. If you do not wish to answer any question I ask you please do not do so. You said that some farmers had lost all their capital?—Yes, they have.

Arrears of rent.

15,498. Have they paid any rent during that time?—Yes, they continue to pay the rent. Of course there are very many instances where they do not, and where they have been continuing in arrear for years.

15,499. Are they good farmers who are in arrears?—Yes.

15,500. Therefore the amount of arrears would mean that they were paying too much rent?—You see they have been crippled in many cases by having to pay really two rents, the interest on borrowed money, and the rent.

15,501. That is not the point, when a man gets into arrears with his rent, and he is a good farmer, how is that?—He is having to borrow money then and to pay a high rate of interest and that cripples him more than anything else.

15,502. So that some farmers have not been in a good position when they took the farms—they have had to borrow money?—Exactly so.

Tenants' capital.

15,503. Therefore the landlords in your part of the world do not look to see whether a man has got capital himself or whether he borrows it?—The landlords in our part of the world inquire into a man's character before they take him for a decent farm, and they take a man with capital of course in preference to a man who has no capital.

Mr. J. W. Broughton.
5 Apr. 1894.

15,504. But they do not mind a man who farms upon borrowed capital?—Yes they do.

15,505. Why do they take such men when they have 10 or 12 applicants for a single farm?—In some cases perhaps it is the son who applies for the farm; you see he succeeds his father, the father has gone off the farm, and so perhaps they take a man who is not quite so well to do in the world if he has a right in the way of being a son.

15,506. Yes, the son would naturally succeed to the father and succeed to the father's estate I suppose. However I will not pursue that question further. You stated that the tenants do not consider the burdens when they take a farm?—Yes, they do not consider them to the full as they ought to.

15,507. Therefore they have to pay that extra burden in addition to the rent which they have not considered?—Very often so.

15,508. That would mean that the land is let over its value?—Very much over its value, certainly, it would mean.

Sliding scale for rents.

15,509. Why do you think a sliding scale for rent would be useful?—The sliding scale for tithes has proved to be very satisfactory, I think, and it would be on the same lines.

15,510. Is there a demand for a sliding scale in your district?—I do not think there is any great demand for it.

15,511. Why would you advocate a sliding scale?—I said that I would advocate a sliding scale in some few cases perhaps.

15,512. In what cases?—I think more particularly in the case of small farms. I mean to say that if legislation were to bear on that question and say that there should be a sliding scale for farms, that in our district the sliding scale would have to be based upon what I said before, the prices of mutton, beef, and butter; that is what I particularly wish to say.

15,513. You say in your proof that you should equalise the cost of carriage of stock as comparing foreign with English?—Yes.

15,514. Have you any instances in which they are not equal?—I have not any statistics before me.

15,515. Do you think the tenant would be benefitted by division of rates between landlord and tenant?—Yes, I think the tenant would benefit in that case.

Reduction of rents.

15,516. (*Captain Owen Thomas.*) Would you say that the farmers are satisfied with the reduction of 20 per cent. which has been generally made in the district?—No, I did not say they were satisfied.

15,517. I ask you would you say so?—Generally speaking, I think they are not satisfied.

15,518. They are not?—No, generally speaking they are not satisfied with the rents as they are now, but they are a complaining class as we all know.

15,519. Are they applying now for further reductions?—Yes.

15,520. In a body?—Of course not to such an extent as they were a couple of years ago; I think they are more satisfied now than they were two or three years ago—very much so.

15,521. Would you say that they are able to make a living at the present time without borrowing or spending any of their capital in paying the rents?—As last year's times were with us, yes.

15,522. You think they could do so?—Yes.

Present position of farmers.

15,523. Which do you think has suffered the most, the traders or the tenants during the last 10 years?—They have both suffered—I should say they have suffered pretty well equally.

15,524. Would you say that the land is as well cultivated now as it used to be formerly?—No, I do not think it is.

15,525. Is it getting worse?—Yes, it is decreasing in value partly owing to the bad seasons. Perhaps the wet and bad seasons we have had for so many years have tended to sour the herb.

Labour.

15,526. Is as much labour employed on these farms as there used to be?—Not quite; there is very little difference.

Mr. J. W. Broughton. 5 Apr. 1894.

15,527. Is the quality of labour as good now as it used to be formerly?—Yes.

15,528. (*Mr. Everett.*) With regard to the labour, would outsiders from other agricultural counties have a chance of getting employment in your district at anything like those wages if they were competent men, do you think?—I do not think they would; they do not understand the class of work that has to be done in our district. There were some men imported—if I use the right word—from, I think, Warwickshire on the Gladstone Estate; they were not satisfactory at all; they were paid much less wages, and they had to go back.

15,529. Speaking generally, you would not think it advisable for a man living in a county, as I do, where a great many men cannot find work at all—good agricultural men—to send them up into your district in the hope of getting it?—No, I do not think so.

Characteristics of district.

15,530. (*Mr. Elton.*) You spoke of the district being valley land a good deal, but of course your district has a great deal of hill land with it?—Yes.

15,531. All that hill country about Settle?—Yes.

15,532. Great limestone farms?—Yes.

15,533. And all that Malham part?—Yes.

15,534. It is altogether sheep farming, I suppose, about the hill land about Malham?—To a great extent, not altogether.

Sheep and cattle gaits.

15,535. I want you to explain a little more about the local institution you spoke of, the sheep gait, just to get it clear. A great deal of the land in Yorkshire is held in common by owners of cattle gaits and sheep gaits, is it not?—Yes.

15,536. That is not the same as right of common, but is a sort of joint ownership of pasture?—The commons about us are principally stinted.

15,537. Are these sheep gaits that you were speaking of all stinted commons?—Yes, principally so.

15,538. But you have two kinds I have understood when I have been there. There is land on which the pasture belongs to a number of persons jointly which is one kind?—Yes.

15,539. Where the owners of the sheep gaits may be considered to be the owners of the land between them?—Yes they may. If it were to come to an inclosure, of course, they are owners of the land.

15,540. There is another class and that is more like what we call a common in the South of England where one person has the soil and the others have only rights of feeding on it?—Yes; but there are not many cases of that sort. The commons are principally stinted.

15,541. The Yorkshire custom is more to have shares of the pasture?—Yes.

15,542. Than what we should call in the south country rights of common?—Yes, exactly.

15,543. What I was driving at was this: that when you are talking of a farm with so many cattle gaits and sheep gaits to it you ought to add something to the size of that farm for the gaits because it is more than a right of common; it is really a large farm?—Yes, it is. Such a farm of say 100 acres would have perhaps 100 sheep gaits.

15,544. What I meant was that it is more than a 100-acre farm, because you see it is 100 acres severalty and 100 shares in a large piece of pasture?—Exactly so.

Breaking up grass land.

15,545. About that breaking up of the grass land, is breaking up bits of grass quite a new system, or has it been done for many years?—There had been nothing broken up until about three or four years ago for 40 years.

15,546. It is not a custom of the country?—No; but I think it will become so, and very useful to break up, as I said before, four or five acres on a decent sized farm.

15,547. Do you mean permanent breaking up, or breaking up for a crop or two?—Breaking up for a few crops.

15,548. I have heard of such a custom in the Midlands, about Sherwood, I think where there used to be a plan of breaking up grass for a few years?—Yes.

15,549. You think that that might become the custom in your part of the country?—Yes, I think it will become more common than it is at present.

15,550. (*Viscount Cobham.*) The land is excellent, is it not, for the growth of oats or turnips?—The land varies very much in quality.

15,551. The better land, the land that would be selected for the purpose, I mean?—Yes, there is land which is very good indeed for that purpose especially after being down in grass for so long.

Mr. J. W. Broughton. 5 Apr. 1894.

15,552. You think that it would benefit the farmers a good deal to break some of it up?—Yes, there is no doubt whatever about it; it is a general consensus of opinion.

Average rent.

15,553. (*Captain Owen Thomas.*) May I ask what the average rent is per acre?—I do not know exactly what it is; it varies very much indeed. The higher lands will perhaps be 5*s.* an acre, and the best low lands will be 4*l.* an acre. Accommodation land has not gone down very much; that is to say, land near a town or close to a village, or anything of that sort; and they can get 4*l.* an acre for that without difficulty. In the division there are 411,809 acres, and the rateable value is 397,744*l.*

15,554. (*Viscount Cobham.*) That includes all the moor land?—The whole lot.

15,555. Everything; woods, and so on?—Yes; everything.

Property tax.

15,556. Do you wish to add anything to your evidence?—There is something that I thought I might say about the property tax; that is, that the landlords should not pay property tax on the full of the rental, but rather on a rateable value, because, of course, they are paying on the full value of the rent without the deductions on it.

15,557. You are speaking of the landowners?—Yes, of the property tax. It should be on a rateable rather than on the full rental. By some land agents, myself included, it is considered that the rates should be on the same basis for Imperial, county, and local taxation.

Assessment to rates.

15,558. (*Captain Owen Thomas.*) Has the assessment been reduced since the reduction of rents?—Yes, it has. The assessment in the Skipton Union now is based on the rents.

15,559. Based on the rents?—Yes, with, of course, a certain amount of reduction. I think it is 10 per cent. off the rent. I do not think it acts fairly at all, because a man may pay 2*l.* an acre for one field, and for the next field, which is really of the same value, another man may be paying 4*l.* an acre; it does not seem to act fairly at all.

15,560–61. (*Viscount Cobham.*) Have you any better way to propose?—Let it go by valuation. I would have a re-valuation every 25 years or so.

15,562. Both for local and Imperial taxation?—Yes, and have the whole on the same basis, local, Imperial, and county. I do not see any reason why it should not be so.

15,563. (*Captain Owen Thomas.*) Is not the usual mode throughout the Union to assess the rates the same as the rental?—Yes, with 10 per cent. off. The Assessment Committee make their assessments in that way now.

15,564. It really depends on what a man pays in rent?—Yes, and not on the actual value of the land.

15,565. (*Mr. Elton.*) In many kinds of valuation the rent is taken as *primâ facie* the value, owing to the experience of mankind, that people generally pay about the value; but it is open to a person who says that it is not the true value to try and prove so?—Yes.

15,566. Do you see any objection to taking the *primâ facie* value as a convenient measure of value?—A large farmer may have some land which he pays 2*l.* an acre for, a lesser farmer may have some accommodation land, just one field we will say, at 4*l.* an acre adjoining, and of the same quality, and the other man has it at 2*l.*, simply because he takes it along with a large farm.

15,567. But unless one were to be always at it the easy thing would be to take the rent as the value and let the circumstances be proved by the persons interested. Let them say, "I ought not to be charged "on my rent because it is a special case"?—Yes, that is the easiest way; but sometimes they do not care to appeal.

15,568. It leads to occasional injustice would you say?—Yes.

Sanitary rates.

15,569. (*Viscount Cobham.*) Is there anything else which you wish to add?—I think the sanitary rates are a burden on the land, as Mr. Punchard gave it, in his evidence. I am quite of his opinion. The land ought

Mr. J. W. Broughton. 5 Apr. 1894.

not to be charged as the farmers get no benefit from the water supplies and drainage systems that are carried out for clusters of cottages; but still they are charged on the land at a quarter.

15,570. Are there some farms which come within the urban district, and are rated to the full extent for sanitary purposes?—Yes, in urban districts I think so; but it is the rural districts that I am speaking of more particularly.

Mr. J. W. Broughton. 5 Apr. 1894.

15,571. You say they derive no benefit from the sanitary rate?—They derive no benefit whatever from a drainage scheme for instance.

The witness withdrew.

Adjourned to to-morrow at 12 o'clock.

Twenty-seventh Day.

Friday, 6th April 1894.

PRESENT:

VISCOUNT COBHAM IN THE CHAIR.

The Right Hon. HENRY CHAPLIN, M.P.
Sir ROBERT NIGEL FITZHARDINGE KINGSCOTE, K.C.B.
ROBERT GIFFEN, Esq., C.B.
CHARLES ISAAC ELTON, Esq., Q.C.
Captain OWEN THOMAS.
FRANCIS ALLSTON CHANNING, Esq., M.P.
JOHN CLAY, Esq.
CORNELIUS NEALE DALTON, Esq., C.B.
ROBERT LACEY EVERETT, Esq., M.P.
JOHN GILMOUR, Esq.
GEORGE LAMBERT, Esq., M.P.
WILLIAM CUTLACK LITTLE, Esq.
WALTER HUME LONG, Esq., M.P.
CHARLES WHITEHEAD, Esq., F.L.S.

HERBERT LYON, Esq., *Secretary.*
R. F. CRAWFORD, Esq. } *Assistant Secretaries.*
FREEMAN THOMAS, Esq. }

Mr. CHARLES WILLIAM SMITH called and examined.

Mr. C. W. Smith. 6 Apr. 1894.

15,572. (*Viscount Cobham.*) Will you tell us what means you have had of forming an opinion upon the subject that you are going to give evidence upon?—The futures and options systems were first introduced into the cotton trade of Liverpool in the year 1875, but I can go back to the year 1862 when I first went into business. I have been in the systems from their infancy since they were introduced from America into this country, and have watched them and have written upon them.

Experience of the "options and futures" systems.

15,573. You are in the wheat business yourself, I understand?—I have been a general broker in Liverpool, where they deal in almost all articles of produce all over the world.

15,574. From what time?—From 1862 up to 1890. I have also been the editor of a Trade and Finance Circular issued every week; and naturally I have to keep myself *au fait* on every single thing that goes on both in the financial world and in the commercial world.

15,575. During the time that you are going to deal with, you have had practical acquaintance with this system of futures and options?—From its very introduction into the country.

15,576. Will you describe to us, as clearly as you can, the growth and character of that system?—It is a system which was introduced into the cotton trade first of all about the year 1875; then it was introduced into the sugar trade, about 1880 I should think; then it was introduced into the Liverpool grain trade about 1883, as a system, but it was not introduced into the grain trade in Liverpool as under a registered settlement house system, combined with daily differences in price, until the year 1888 to 1889.

Growth of the systems.

15,577. (*Mr. Giffen.*) Was that the beginning of the system of having such dealings in this country—were there not similar dealings in pig iron at Glasgow?—Yes. They go back to about 1852. Pig iron in Glasgow is the earliest case; but that is not the same thing exactly—that is done in warrants. The statement that I have prepared brings out that most forcibly. In 1844 these very systems of gambling and speculating in produce, both by statute and by common law were forbidden in this country—in 1844, that was two years prior to the repeal of the Corn Laws in 1846. Therefore the gambling that went on in pig iron in Glasgow, which as far as I can trace, commenced, I think it was, in 1852, had to be kept within the law. The difference between gambling in warrants in the case of pig iron, and in options and futures in the case of food products is very great. One is legal tender, it is recognised by the banks as legal tender, and evidently when the rules were framed for gambling in pig iron after the passing of the law which both at statute and common law cancelled all the gambling in these different commodities, they had to frame their rules in Glasgow in reference to pig iron, so as to keep within the law.

Difference between gambling in pig iron warrants and options and futures.

15,578. (*Viscount Cobham.*) What is the substantial difference between the two systems?—That is a most important point. I say in the paper which I read before the Central and Associated Chambers of Agriculture: "As regards gambling in pig iron—which "industry was the first to be attacked—let me refer to "one important factor in connexion with that metal "in the shape of 'Warrants' in comparison to "gambling in 'Options' and 'Futures' in wheat and "other farm products. The former are only dealt in "for cash or for one month's delivery, and represent "actual iron in stock. Consequently each warrant is "a legal stamped instrument, and against it banks "make advances in the ordinary way. But, remember, "this fact does not stop rampant speculation without "the transfer of commodities." They have instituted a similar plan in the last few years in pig iron, exactly in the same way as you gamble on the Stock Exchange; that is, you carry over, do you see, if you are short or if you are long. Therefore, although these laws were framed, they have been undone on that point by operating in warrants of pig iron, exactly in the same way as you can speculate on the Stock Exchange.

15,579. (*Mr. Giffen.*) Then the effect of your evidence is that there has been gambling in pig iron for a long time, but not of so extended and so elaborate a character as you think there is in cotton and grain now; is that the effect of it, or is there something very different in the gambling in cotton and grain?—It is quite different. I say in my paper from which I have already quoted: "Hence, although this system of

Mr. C. W. Smith.
3 Apr. 1894.

"gambling in metals has for the past 20 years been "acknowledged as one for depressing values, and in "consequence of which legislation some years ago was "proposed, besides causing wide and unnatural fluc- "tuations in values, inflicting injury thereby not only "on the manufacturers and traders but also on the "producers; still, it is not so ruinous, as I shall "explain (although serious enough), as the gambling "contracts in food products and other articles of "agricultural produce. These latter"—that is, the Futures and Options systems—"hardly ever carry any "actual stocks. They are sold many months ahead, "even before the seed is in the ground. They are not "a legal instrument, nor are they recognised as such "by our banking institutions. Hence, they must have "even a far more ruinous and lasting effect on values, "and on our manufacturers and producers, than the "gambling in 'Warrants' in pig iron."

15,580. Then it is the system of Futures that you are specially attacking; is that so?—Yes, exactly. I simply wished, as you mentioned the subject of pig iron, to show you that, although the system of gambling in pig iron has been for some years acknowledged as one for depressing values, still it is not so ruinous as the system of gambling in Options and Futures, for the reasons I have given you.

The systems from an agricultural point of view as compared with stock exchange gambling.

15,581. It is not the ordinary gambling such as takes place on the Stock Exchange that you are specially aiming at, so much as the systems of Options and Futures; is that what we are to understand?—Undoubtedly. I hardly dwell upon the system of gambling on the Stock Exchange. I am simply taking the subject up from an agricultural and commercial point of view, in order to prove the depreciation and the ruin which these systems are entailing.

15,582. What I wish to get at now is the exact nature of the gambling which you are attacking?—It is the systems which have sprung up in the wheat trade principally and in other trades.

15,583. Then I wish to ask you about sugar; you spoke of gambling in that beginning in Liverpool in the year 1880?—I think it would be a little before 1880.

Sugar gambling.

15,584. Was there not a large amount of gambling many years ago in Greenock in sugar?—I do not know.

15,585. Exactly of the same nature?—I am not saying a single word about gambling in itself. The basis of the commercial world is speculation, but you must remember that before these systems were introduced all people I suppose in the commercial world were "bulls"—that is, they were all interested only in a rise; but under the systems which have been introduced into the commercial world and the financial world the "bear" stepped in.

15,586. Then it is a special system of speculation that you are attacking?—Entirely.

Legitimate speculation.

15,587. Not speculation in general?—Most distinctly not, because under the old systems (and that is what I am prepared to prove) in every article of produce prior to these Futures and Options systems being introduced, all speculators only operated for a rise, and hence any manipulations of the speculations that were carried on did not hurt the producer or the farmer. It is only since the systems have been introduced into these various trades that the farmer and producer have been made absolutely the spoil of the gambler, because the "bear" has been introduced.

Explanation of the option, future, and settlement systems.

15,588. (*Viscount Cobham.*) I think we shall understand that better if you will describe as clearly as possible the system which you are attacking?—The systems I prominently bring before you are those which are now termed the Option, Future, and Settlement systems, introduced into this country in 1883 as the basis for moving, manipulating, and importing foreign wheat and other commodities, and I believe that in them, combined with the enormous gambling in these commodities throughout America and England, which has as a natural consequence arisen out of these systems, the main and principal cause for the present and late enormous depreciation in the value of agricultural produce, and especially of wheat, may be found. I may mention that about the year 1875, when these systems were first introduced from America into the cotton trade in England, the older business men of that day termed them "time bargains," a name which expresses exactly what they are. The most important features of the systems may be described as the forestalling of crops by selling them before they are grown; the sale for future delivery of produce which the sellers do not possess, and do not intend to deliver; an enormous amount of reselling without the transfer of commodities, resulting in rampant speculation; a method of hedging on behalf of importers conducted after the professional betting man's plan of bookmaking; the multiplying of crops on paper 40 to 50 times larger than the actual crops grown by farmers; and the establishment of clearing houses in which a daily or weekly settlement of sums due on variations in prices is effected. The systems were introduced after the American fashion into the Liverpool Grain Produce Exchange in 1883, but were not extensively used, combined with a settlement system till 1889. The London Produce Clearing House was registered in 1888, but was established some years prior to that year.

Mr. C. W. Smith.
6 Apr. 1894.

15,589. (*Mr. Giffen.*) Might I ask how they were settled before that settlement system was introduced?—Before the settlement system was introduced from 1875 to 1883, actual produce used to be tendered against those contracts.

15,590. So nothing happened under the contracts until the time for delivery came?—Exactly, until the delivery came, that is, if you sold a May-June delivery, for instance, or a July-August, or August-September delivery, in the month of April, we will say—now—those contracts were never liquidated prior to this settlement system until actual produce was tendered against those systems.

15,591. Now, under the settlement system, as I understand, the difference in the price at the moment, compared with what it was when the contract was made, is made the subject of settlement, and the one man has to pay to the other, according as the balance may be?—I can do contracts with every gentleman in this room from 10 o'clock in the morning till 4 in the afternoon, and by next week, by next Thursday, by buying and selling from all of us, every contract within the one week would be run out under the settlement, and those contracts would absolutely cease to exist without any produce being tendered against them. There are thousands and thousands of contracts constantly run out on various days.

Explanation of the present systems.

15,592. (*Viscount Cobham.*) Or carried on, as the case may be?—No, it is compulsory. Say there are 300 men in this room, and we trade together every day, or 20 times during the day, in these bits of paper, in these Futures and Options, at the end of the week, that is, once a week there is a settlement, and it is compulsory that there should be a settlement upon all these contracts that fit in, that is to say, if I have bought from you ten thousand contracts, and you have sold to me ten thousand contracts of the same months, those ten thousand contracts between you and me are wrung out. I may explain that the contract which is ruling in this country now is a contract that is really my contract. We had a very terrible state of things in 1878 in Liverpool. Under the old systems, when it was compulsory for commodities to be tendered against actual produce, the liability of the contracts had not run out, and we had a great panic in that year. The consequence was that there were a large number of failures, and although people had bought and sold—for outside constituents you see—and although those people had made profits, those profits were not due until the ripening of the contract and the actual contract was liquidated by actual produce, so that although you made 5,000*l.* or 10,000*l.*, we will say, on Futures and Options contracts, still you never got your profit as an outsider, and no more did I as a broker trading under the systems, until the month July-August, that is four or five months later, came round. The consequence was that there was a celebrated case called Cooke v. Eshelby brought by a trustee under a bankruptcy against a broker in Liverpool. The question was taken up to the House of Lords, and great expense was gone to over it. When I saw that system was absolutely growing so enormously in this cotton market and extending to other markets, I brought it before our Association, and I told them that if the thing was going on, no man dare trade under those systems. The consequence was that a committee was formed, and a new contract was made out which makes every man under that contract himself liable, do you see, as his own principal under every contract, so that there was no going behind anybody, and, therefore, under the settlement system every contract is wrung out compulsorily.

Mr. C. W. Smith.
6 Apr. 1894.

The settlement is now week by week, and that is the way these contracts are liquidated. Therefore we run the risk only now of one week's differences.

15,593. Then this system was introduced as an improvement upon the previous mode of settling speculative business?—On account of that.

Basis of the various settlements of wheat, cotton, and the stock exchange.

15,594. (*Mr. Whitehead.*) Might we have now what is the basis of these settlements?—In the grain markets in Liverpool, and I believe in London also, it is a daily settlement. In the Liverpool Cotton Market and other markets it is a weekly settlement; the oftener the settlement is the greater the danger to the article dealt in. Therefore grain coming under a daily settlement the effect is far more injurious than is the effect in the case of those products which come under a weekly settlement. You know what the effect of the fortnightly settlement on the Stock Exchange is. I do not care whether it is on the Bourses on the Continent or in this country. You will always see, as a rule, unless there is some very strong reason for the contrary, the markets weaken or go quiet two or three days prior to the settlement: they say, "pending the settlement the markets have gone quiet." Therefore you can imagine what it is if you were an outside constituent, anywhere you like, in any part of England, or on the Continent, or in America, or anywhere—many of them do business through a London or a Liverpool house—and you have a daily settlement, and you have any grain Futures, and the markets keep going down; and I telegraph to you, "remit me 200*l.*," or "remit me 300*l.*," at last you say, "Sell out." Therefore it is far worse in the grain markets having a daily settlement, as they have in America and in Liverpool, than it is with a weekly settlement, as in cotton. Of course, it is quite bad enough, either for a fortnightly or a weekly settlement.

Explanation of contracts under the systems.

15,595. (*Mr. Giffen.*) Have you a copy of the form of contract?—I have not got one with me, but of course that is a most important thing. I can give it you as far as grain is concerned. I think as far as grain is concerned in America there is only what you would call grain up to No. 2 Grade which can be tendered on these contracts—that is, you may say, an infinitesimal part of the total wheat crop of America. The same practice is in existence in Liverpool.

15,596. I think what we should like to see would be a copy of the form of contract so as to know what people are really dealing in?—Wheat of a grade coming below No. 2 cannot be tendered, and has to be sold by sample.

15,597. What is the obligation—to deliver it at the end of the week?—You cannot deliver it, because it is not grown in America.

15,598. Then what is the obligation?—It is simply a gamble in the prices of commodities.

15,599. Yes; but how is the contract expressed? A. B. buys of C. D.—what does he promise to do?—I sell to you, and you return to me a contract: "I buy from you." If you and I were brokers in the Produce Exchange of Liverpool or London, you would return to your constituent, who might be in the country anywhere, another contract. I should also return a contract, and those contracts are exchanged.

15,600. What is said about the date of delivery in the contract?—May–June delivery, or June–July delivery, or August–September delivery, or November–December delivery.

15,601. How can that contract be settled within the week, and what is the mode by which it is settled within the week?—That is what I have tried to explain to you. It is wrung out by the aid of the settlement itself, each party to that contract being his own principal.

15,602. That is to say, one contract will be set off against another, as I understand it?—Quite right.

15,603. That is what is done?—Yes.

15,604. One contract is set off against another?—Yes, of the same month. If you and I have done 50 contracts in the week, we will say, for a September-October delivery, wheat or cotton, or any article of produce you like, at the end of that week all the contracts that fit in, do you see, are run out, and so that contract has absolutely ceased to exist.

15,605. What about the contracts that do not fit in?—They are carried on from week to week.

15,606. Then are new contracts made?—You make the contracts every minute of the day, if you like, or every quarter of an hour in the day. There is an enormous quantity; nobody knows the per-centage that has been wrung out at the end of a particular week. If you and I had very large transactions together as two brokers inside the Produce Exchange, you and I would make up our minds to do as much as we possibly could together in order to have our liabilities cease.

Mr. C. W. Smith.
6 Apr. 1894.

15,607. Then the American system is that they have daily settlements to find out what contracts may be set off against each other; and the system in Liverpool at one time was that you had weekly settlements?—That is in cotton.

Difference between Stock Exchange gambling and the systems.

15,608. The difference between them is that the one is weekly and the other is daily?—Exactly.

15,609. And the difference between them and the London Stock Exchange is that the London Stock Exchange has a fortnightly settlement?—Yes.

15,610. Except in Consols, where it is monthly?—Yes, exactly: but the ordinary system, you may say, is a fortnight. Therefore you see you reduce your liabilities as a speculator upon these various Exchanges—in the grain markets to one day, in cotton to a week, and on the Stock Exchange to a fortnight.

15,611. The whole effect is that you set off one against another, and only deal with the balance?—Yes, we only deal with the balance.

Compulsory delivery.

15,612. (*Mr. Little.*) Could you under any circumstances compel the delivery of the article you bought?—Undoubtedly; if you buy a thing you can compel delivery.

15,613. Then if you buy on this note wheat from A. for delivery in June, do I understand that you can insist upon the delivery?—Most distinctly you can insist upon it if you like.

15,614. Then you are not obliged to settle?—Yes, you are; you settle any differences week by week.

15,615. Suppose there is no difference; suppose I buy of you 1,000 quarters for May–June, and do not sell any, and I require to have those 1,000 quarters?—I should pay you every week any differences, or you would pay me, as the market went up or down.

15,616. But would the contract still hold to deliver the goods?—If it was run out, you mean to say? Suppose you buy from me this April 1,000 tons of wheat to be delivered in July–August, and you are going to insist upon delivery, can you do so? You can insist upon it when July and August come round.

Explanation of margins and differences.

15,617. What takes place in the meantime?—I pay you on every fluctuation daily, or you pay me, as the market goes up or down.

15,618. That is the margin?—The margin of the fall and the rise in the market.

15,619. But still you can insist upon the performance; you can insist upon the actual delivery of the goods purchased?—Undoubtedly the buyer can.

15,620. (*Viscount Cobham.*) He never does, does he?—Hardly ever. I have been an operator in almost every article of produce certainly from 1875, which is since the introduction of the systems, that is for 19 years, and I have been a partner in a firm with a quarter to half a million of money, dealing in all those things; and I can say, I think, with absolute truth, that I have never seen delivery demanded, and I have never seen the seller give delivery on any option contract at all, except in one year, 1886, when I attempted to make a corner in cotton. Then I demanded a delivery, with the object of cornering the market; but that was an artificial thing, which, as a rule, never happens.

Explanation of cornering and the tendering clause on contracts.

15,621. In fact it is only when cornering comes in that the actual delivery is demanded?—That is all, as a rule, or under certain financial reasons. For instance, if you had done an enormous business on this system, and bankers were pressing you for money, or you wanted some bills, or something like that; then you would have to sacrifice, as a rule, your property, you see, and make the tender.

15,622. It may very well be that the actual wheat subject to the contract is no longer to be had?—That is the great point which I was telling you about, that no wheat which does not grade up to No. 2 can be tendered on these contracts, and as the smallest per-centage of the total crops of wheat grown in America ranks under No. 2, the whole of that business done in America is done speculatively and it is impossible to

Mr. C. W. Smith. 6 Apr. 1894.

tender against the contracts. That contract holds good in Liverpool also.

15,623. Is graded wheat solely the subject of exportation from America?—No, you can import any class of wheat; but the basis of these option and future contracts is that no grade can be subject to them which does not rank as No. 2, the lowest grade in which option trading is carried on. Mr. Wood Davis, in America, in giving his evidence said, "that 98 per "cent. of the wheat grown in Kansas"—that is the biggest wheat growing country in America—"in 1892 "was below grade, and had to be sold by sample. "Yet," he went on to say, "the prices of the entire "crop were ruled by those prevailing for the very small "proportion of the crop sold many times over under "the option system, for it is only the price of graded "wheat which is quoted in the market reports." Therefore you see there is all this business carried on in that way, and nobody knows what it is. In America they estimate fictitious crops of grain as being sold 50, 60, or 70 times on bits of paper over and over again under this settlement system. The same in this country, the same in Berlin, the same in Paris; but to a smaller extent. The quality grown is below the grade in which you have to tender on these contracts. Therefore it speaks for itself. It reduces itself to this: that they are simply issued as gambling bits of paper contracts; that is gambling in the *prices* of commodities.

15,624. (*Mr. Giffen.*) Are the obligations to sell outstanding at one time 50 or 60 or 70 times the crop?—That you cannot get at. In America of course they keep everything as dark as they possibly can on this subject, the same as they do in this country. I have got no end of evidence here on these very points that you are asking me.

15,625. I wish to understand exactly what you meant by your statement that there was 50, or 60, or 70 times the crop sold; and I wish to know whether at a given moment there were obligations to deliver 60 times or 70 times the quantity of crop?—Not at the same time.

15,626. Not at the same time?—No; certainly not. That is the number of times it is sold in the 12 months.

15,627. (*Mr. Chaplin.*) Why is this basis of options and futures limited to that particular grade of wheat?—For the basis of the gamble.

15,628. Merely for the object of gambling?—No doubt about it: in the same way that in 1875 or 1878 the contract for cottons, about which I have most important evidence, when it first originated in Liverpool, had what is called the "good ordinary" clause, that is, nothing below "good ordinary" could be tendered; but that did not suit certain gamblers whom I am perfectly prepared to give all particulars about, and they raised that to "low middling," that is a higher grade. Therefore you see that they could make a corner very much easier, or do a larger gamble with a less quantity of cotton to be tendered. They could make their manipulations and they raised the standard. Now take this question of the Lancashire cotton industry which I dwell on as it is most important, and which I have written on for 10 or 12 years, and brought before Lancashire and the various leading men in the country. In Liverpool the future cotton contract is the only contract in the world which has a tendering clause limited to "low middling." That is the reason why I estimate that the spinners and manufacturers alone of Lancashire from 1878 to 1890 lost a profit of 15,000,000*l.* sterling by that gambling action. What did they do when there was short time in Lancashire owing to these corners? By these contracts they let their Eastern competitors and they let America be free. Those countries were doing the business of the world while Lancashire was standing still for months and months during those corners; and from 1878 to 1890, owing to that contract in Liverpool being framed in that way the trade for 8 years out of those 13 was absolutely brought to a standstill by strikes sometimes lasting two, three, four, or five months.

Liverpool cotton contracts and explanation of corners.

15,629. (*Mr. Giffen.*) Then that was a bad definition of the article in the contract; the definition ought to have been wider?—It was done on the instigation of the gamblers themselves in order to create a gamble, as I am prepared to prove.

15,630. Still there must be a definition of some kind or you could not have dealings in these articles at all—they must be very clearly defined; is that not the case?—I simply sell you "10,000 bales of cotton, "nothing below 'Low Middling' to be tendered," that is the contract, and you buy from me "10,000 bales "of cotton nothing below 'Low Middling' to be tendered," you and I sign it and the contract is done.

Mr. C. W. Smith. 6 Apr. 1894.

15,631. But there must be something more than that to interpret the contract because if there are different qualities the buyer is not going to take anything except the quality he has paid for?—The buyer never does take it; for the last 15 years, except in corner years, there has been, you may say, absolutely no tender on behalf of the seller and no wish on behalf of the buyer to accept a single pound's worth of stuff against it.

15,632. Still there is a power of taking it?—Undoubtedly, but it is never taken advantage of, or hardly I would say, except in corner years.

15,633. (*Mr. Clay.*) If I buy wheat why do they not form the basis of the operation upon No. 1 wheat?—It would not suit the gambler.

Basis of operation in wheat contracts.

15,634. Is there too little of No. 1 wheat grown?—The higher you can raise the tendering clause—that is the minimum tendering clause—the easier it is for these big operators in America and elsewhere to manipulate these paper contracts. The higher you can get it the more certainty there is that they can run a corner.

15,635. The quality of the Dacota wheat is higher than that of the Kansas wheat, is it not?—There may be a slight difference in grades of wheat. I have read to you what Mr. Wood Davis says, namely, that in Kansas alone 98 per cent. of the wheat grown in 1892 was below grade.

American evidence on grades of wheat.

15,636. Is Kansas wheat not inferior to Dacota wheat as a rule?—I suppose it may be a little.

15,637. (*Mr. Chaplin.*) What I understand you to mean is this: that this limit to a particular grade of wheat is and must be purely for gambling purposes to facilitate the gambling?—When it was first instituted in this country, as I have explained, actual produce had to be tendered against it, and then it was legitimate enough. I am not wishing to stop the options and futures, all I am wishing to do is what the American Anti-Option Bill, which is now before the House of Representatives, proposes to do. They propose to say that if a man sells these things he must deliver against it. If you do that it does not matter to me how the wheat crop is moved from America or any other country into this country as long as it is moved, being a necessity for this country, as it is now; but by making it compulsory on behalf of the seller to tender the actual stuff against that contract, you rob anybody of the power of selling hundreds of thousands of pounds worth or millions of pounds worth either by fictitious contracts or by a fictitious quantity of grain which never exists except on a bit of paper, and which reduces the business to one of gambling on paper in the prices of commodities. It is that fictitious quantity of grain that is floated on paper all over the world under a daily settlement, and under a registered settlement system, which is the cause of this depreciation in value. I have written on the subject for 10 to 15 years and prognosticated these things in every word I have written of it.

Proposed legislation on the systems in America.

15,638. (*Mr. Long.*) Would it not be right to describe the system that you want to attack as that under which, as opposed to the system in pig iron, which you have already described, people sell only that which they have not got?—There are leading men in England, you know, who will tell you that the depreciation in values in the case of pig-iron for which legislation some 15 years ago was proposed exactly on the same lines that I am taking now, has been the cause of the ruin of the iron industry.

Proposed legislation on pig iron gambling.

15,639. What I understood you to say just now, in answer to a question from Mr. Giffen as to the gambling in pig iron, was that in that case there was a warrant and behind the warrant there was a deposited article?—Yes.

Difference between gambling in pig iron warrants and options and futures in wheat.

15,640. That that warrant was regarded by the banks as security against advances?—Yes.

15,641. It was legal tender for an advance?—Yes.

15,642. But in the gambling in options for wheat there was in the first place no warrant?—That is so.

15,643. And in the second place no deposited article?—That is so.

15,644. Because in many cases it was not grown?—Yes, that is so.

Mr. C. W. Smith.
6 Apr. 1894.

15,645. Consequently they were gambling in things which had no actual existence of any sort or kind?—Not worth the paper they were written on.

15,646. Exactly; does it not follow from that that the distinction between gambling in pig iron on the Stock Exchange and gambling in options and futures in wheat consists mainly in the fact that behind the one the man who sells has an actual article which is available for trade purposes, whereas in the other case he has no article at all?—He has none at all; but I would explain to you that in the pig iron you see they beat the idea by dealing like they do on the Stock Exchange, although a warrant is a legal tender with the banks. I would do for you as many contracts as you like in iron and never pass any commodities at all from now up to the 31st of December, although I will deal every day with you. They work it therefore on the same system that you work on the Stock Exchange; it is abused in fact.

Comparison between pig iron gambling and Stock Exchange gambling.

15,647. (*Mr. Giffen.*) On the Stock Exchange and in the pig iron market they do sell what they have not got, and people buy, but they have not got money to pay for it, just as is the case in your market?—No doubt.

15,648. (*Viscount Cobham.*) But the iron is in existence?—The iron is in existence; it is in absolute stock in Glasgow.

15,649. (*Mr. Giffen.*) We have Options and Futures on the Stock Exchange, have we not?—But the case is entirely different; I am talking here of an imported article.

15,650. (*Viscount Cobham.*) You have got a great many more facts to bring before us, have you not?—Of course I have.

Decline of markets in the interest of importers and bears.

15,651. We have heard nothing about the system of hedging, for instance; will you kindly go on with your statement. I think we understand now what Futures and Options means?—Of course, in reference to Options and Futures, it is most important to draw your attention to this, that it is in the interest of all sellers of Options and Futures that they should go down. It is entirely in the interest of the bears, for instance, who can sell any amount every minute of the day that prices should go down. It is also, to a certain extent and to a growing extent, in the interest of the importers (who are the principal bears of wheat in this country) if the business is on the basis of the sales of Options and Futures, that the price of Futures should also decline.

15,652. Will you explain how that is; it would make it clearer if you took a transaction from the moment the importer made his contract and followed it through?—I have an extract here which bears on that:—"To the "uninitiated it would seem that a contract made by one "dealer to deliver to another, on a certain day, a "certain quantity of produce could not be turned to "fraudulent purposes. But it is on this basis of a "contract, made between two dealers, that the whole "system of gambling in commodities is carried on. A "class of contract is in use known as 'Options' and "'Futures,' under which one dealer contracts to buy "from or sell to another a certain commodity at a "future date, when it is understood that the first has "none of the commodity in question and will have "none to deliver at the fixed date, and the second does "not wish to obtain any of the commodity which he "has contracted to receive. But it may be asked how "can two men enter into a bargain about a commodity "which has no existence at all? The reply is that "they do not in reality make a bargain about the "commodity, but about its price. A. says to B., 'I "'will take 1,000 tons of corn from you three months "'hence at such and such a price.' B. contracts with "A. to deliver the corn at the date fixed. When the "time arrives B. has no corn to deliver, and A. does "not want any, but the current price of corn is not "now what A. contracted to pay. If it is more B. "pays to A. the difference, if it is less, A., who is "bound to take the corn at the price agreed on, pays "to B. the difference between the current price and "the price of the contract. It will thus be seen that "there is no need whatever to exchange a ton of corn "in order to close the transaction. It will further be "seen that the transaction resembles a bet upon the "course of the corn market, that it is an agreement on "the part of A. to pay if corn falls, and on the part of "B. to pay if it rises. For the purpose of enabling "these transactions to be carried on systematically, "clearing houses have been established in most "countries of Europe. Here, obligation can be set off "against obligation, the difference is paid, and the "parties to the contracts are free to enter into new "speculative engagements. The Produce Clearing "House of Liverpool and that of Mincing Lane, "London, the French Caisses de Liquidation des "Affaires a Terme, and the German Warren Liquida-"tion Kassen, are of this character. These institutions "have their use for transactions which are of a genuine "commercial character, which deal with the exchange "of actually existing commodities. But they also "afford facilities for that species of dealing which we "have described as betting on the market, and which "may, without injustice, be termed commercial "gambling. The system of 'moving' the crops of the "world by means of future transactions had its origin "about the year 1875."

Explanation of a transaction.

Mr. C. W. Smith.
6 Apr. 1894.

15,653. (*Mr. Giffen.*) This is not as to the point you were asked to explain, is it?—That was simply as to a special transaction between A. and B.

15,654. (*Viscount Cobham.*) What we wish to do is to follow out one of these transactions to the end. Take a crop that is grown or that is being grown, and that has been bought ahead by an importer; what does he do?—It may be interesting to give the details and basis of such an operation between the importer and his banker. The former draws, say a three months' bill, on the latter, on the absolute understanding that actual produce is to be shipped against the value of that bill, and further, that Futures are sold against the produce as a hedge by the importer, in case of a decline in values prior to or after the produce has arrived in England. Thus the credit house feels doubly secured in the event of the market value of such produce either declining or rising. If the market declines, the house knows that the importer will be able to make such profits on his future contracts as will probably cover the loss on the fall in his actual produce, and will thus recoup himself for the latter. This profit on his Futures the importer holds for the benefit of the credit house, in order to meet the deficiency of the full amount of the bills drawn.

Operation between importer and his banker.

15,655. Is it usual so to adjust it as to make that transaction a cover for any possible loss?—Yes.

15,656. Or more than a cover?—It is a question of manipulation after Futures have been sold against the actual purchase abroad. If the market rises, the credit house knows that the enhanced value of the actual produce over and above the amount of the bill drawn, will probably make up the loss the importer has to suffer by the rise in the value of the future contracts which he originally sold as a hedge. Thus it is only, as a rule, when the actual produce is sold to the consumer, that the bill is taken up by the importer, and the accounts settled between the latter and the credit house, and the transaction finally closed. This may take many months before it is accomplished. Hence, from the moment this actual foreign produce arrives in England, and, indeed, in many cases before, it is pressed for sale in various ways on our produce exchanges. For being hedged by Futures, it is immaterial to the importer who is influenced mainly by the value of Futures, what price he resells it at, while it is absolutely necessary for him on its arrival in England, and totally irrespective of the price he paid the foreigner for it, to realise from day to day certain portions of his actual stocks, in order to raise cash to meet the various bills running against such produce. Thus the very fact of only a moderate demand on behalf of consumers, or of depression in the future, or money market, compels the importer to accept lower prices for his foreign produce. It is on this speculative and artificial basis that England is largely flooded with foreign produce, and on this basis the bulk of foreign crops under these systems are moved, manipulated, and imported. This accounts for the enormous over-trading on behalf of the so-termed importers of the present day, the majority of whom have no capital in comparison to the gigantic operations they enter into. The ultimate profits of the importer depend upon the values of the Futures of which he is short (and for which at the time of the sale he obtained a premium or as it is called a "carrying price") becoming more depressed than the value of the actual produce he holds. In this way he hopes to make a small profit on the turnover. Thus it is, as explained in "Commercial Gambling," that the importer is more or less interested in a decline in the market than in an advance. Therefore, under these circumstances, the value of the actual

Manipulation of futures.

Decline of markets in the interests of importers.

Mr. C. W. Smith. Apr. 1894.

imported foreign produce is brought down to an artificial price in this country by the compulsory sales on behalf of the importers. I have shown in my statement that the importer is further a compulsory seller or bear all the year round of speculative paper contracts in the shape of Options or Futures. Thus the actual foreign produce on arrival in England held by importers, as well as the Futures sold by them against such, both tend to artificially and compulsorily depress the market prices of English produce. The above facts ought to have been recognised as of the utmost importance, by commercial men and bankers, at the time they assisted to frame the present rules under which these gambling systems have sprung up.

dging by nporters.

15,657. Will you follow out the Futures that he sells; they go into the market and get bought and sold indefinitely, I presume?—In time, but you cannot tell; once the contract is floated it is resold and resold and turned over the whole time.

he bull as e specu- tor.

15,658. Will you explain why the dealers in those Futures, who of course are pure speculators, are more interested in a fall than in a rise?—They are not the speculators; the man I call the speculator is interested in the rise, because he is a bull; he has bought for a rise.

15,659. It is only the importers who —— ?—Are bears.

rofessional ears.

15,660. Professional bears? — Professional bears. There are many other classes of men who go in for it; I call them wreckers, and a variety of classes of gamblers who operate all day long for a fall.

15,661. I rather gathered from what I have read of your pamphlets that the general tendency of this gambling market was a bear tendency rather than a bull tendency?—Undoubtedly so, in my opinion, and I have expressed it for 10 or 15 years. The views I express to-day I have expressed for the past 15 years, and in every single market that these systems have been introduced to I have prognosticated ruin on the basis, absolutely, solely, and only, of the systems; because I maintain that a bull operator under the systems of a daily and weekly settlement has not a ghost of a chance. I do not care who the man is; I have lost money myself, any amount of it, in the same thing; but the moment your loss becomes what you consider is sufficient, you telegraph to your broker, wherever he may be, "Sell out at any price." Although I have been a bear all my life I may say, for the last 15 years I have never bought anything, because I do not care if 20*s.* was the price of wheat to-day or if 15*s.* was the price of wheat to-day; I will sell it in the face of the absolute deficiency of the whole of the crop of the world's supplies for 1893. As long as these systems are in existence they are applicable to every article of produce; they have only to run three, or four, or five years, and there is the same result—a panic.

eneral esult on rices nder the ystems.

ause of the resent low rices.

15,662–3. (*Mr. Giffen.*) Do you not think it would have come to an end before this, because nobody would be a bull?—Mr. Giffen has asked me a very leading question. That is exactly what is the cause of the present what they call total absence of business on all our product exchanges. Why they are so dead is because the bull has lost so much money since 1890. I am not in business myself now, for I was so disgusted that I left it some years ago; but I have followed it, and am now an interested party in a firm. Therefore I know everything that is going on. There is no buying power left in this country; there is no buying power left in America; but it is compulsory on the importer or bear to sell, and under those circumstances the price must go down. The buying power, in its present condition, cannot arrest the bear from selling, because the bear has to sell, because he has bought abroad, unless he wishes to lose a great deal of money. That is exactly the position of all our produce markets in this country and in America. There is hardly any real business going on, but there is business of a sort going on—there is the importation still on the basis of these systems; and so that man has to sell.

Importers' capital.

15,664. (*Viscount Cobham.*) Is it not the fact that the importers now are using a comparatively small capital?—I am sorry to say so. You may go to London, or you may go to Liverpool or Glasgow—anywhere you like—and you will find that all the old-fashioned people of capital have absolutely been driven out of the business by these systems; they have ceased to be importers. All you gentlemen now, every one of you, I will start you in any business to-morrow with a nominal capital on the basis of these systems; you shall import wheat, cotton, sugar—anything you like—with hardly any capital at all. I will arrange the credit house business for you, and I will turn you all into importers with hardly any capital at all.

Mr. C. W. Smith. 6 Apr. 1894.

15,665. (*Mr. Giffen.*) And shall we make money by it?—That depends entirely on the views you take. If you take an optimist view of a rising market, and it goes down, you will lose; if you keep short you will make money.

Fall in the value of wheat.

15,666. You have just told us that nobody who takes an optimist view—that is nobody who is a "bull'"—makes money; that the market always goes against him?—We know the fall in prices in wheat has been nearly 50 per cent. since 1880, and we know that since 1891 there has been a 30 per cent. decline.

Losses by bulls.

15,667. These questions are only to make your position clear; I am not cross-examining you just now, I merely wish to know where the bulls come from if that is the state of the market?—The bulls were legitimate operators once upon a time, but their losses were, and have been, so terrific—they have paid so much money away—that if a man is in business he has to think seriously; if he is losing a sum of money which is a large per-centage of his capital he cannot afford to speculate any more. It is only in good times when people are making money that the bull goes to the fore. If I am making 5,000*l.* a year, for instance, in my business, and I think I will try to make that into 10,000*l.*, I have something to work upon in order to speculate from legitimate business.

Class of bull speculators.

15,668. Who buys speculatively then at a time like this, or during the last few years?—People that you would be absolutely astounded to think who they were—people of every class from the highest.

15,669. Then there are a certain number of people who exist for the benefit of the importers and others who make money out of their folly, and these people not only cause a loss to themselves, as I understand, but they cause a loss to the whole farming community over the world; is that your view?—I did not quite understand what you said about the importers.

15,670. There are a certain number of people—the bulls—who buy, who apparently exist for the benefit of the importers and others, who are continually buyers, or more or less buyers, not only to their own disadvantage, but to the disadvantage of the farming community all over the world—is that the view you put before us?—The bulls, do you mean?

Necessity for bulls.

15,671. Yes?—Under the systems the bull is a necessity—somebody must buy.

15,672. Precisely; but there is a certain class of people who are foolish to this extent, that they exist for the benefit of the importers and others who bring the wheat from foreign countries, and for the loss of the farming community all over the world, and who do not make money themselves by it?—A bull cannot make money in a falling market, that is an impossibility, and we know perfectly well from the fall that has taken place——

15,673. Those are the kind of people then who cause the mischief—all these people who are so incredibly foolish for themselves and apparently foolish for other people?—You may put it in that light, but I do not put it in that light at all; I put it from the importing point of view. The bear, who is absolutely not an importer, can hammer the markets in the absence of the bulls or buying power.

15,674. Yes, but we wish to understand the other side as well; because it seems to me according to what you say that it is the bull who does all the mischief, because if he did not exist all these operations would come to an end?—Under the systems there must be a bull, but you must remember that if a man has lost money he tries again. If a man loses money on the turf, for instance, he tries once more to spot a winner. Very similarly I am waiting now. I lost money last year in wheat as a bull; I am only waiting to buy, and to try and make that money back again.

15,675. I have had your answer; you assume the existence of that class of people?—Yes.

15,676. (*Mr. Whitehead.*) There must be two to a contract?—There must be two to a contract; every seller must have a buyer.

Fall in the value of wheat.

15,677. (*Mr. Channing.*) Do you attribute the rapidity of the recent fall in the price of wheat to the facts that

Mr. C. W. Smith.

6 Apr. 1894.

you have just been stating to the Commission?—Undoubtedly.

15,678. The rapidity of the recent fall in the price of wheat?—Undoubtedly.

Cause of the present low prices.

15,679. (*Viscount Cobham.*) Perhaps it would be well for you to take that part of the question now unless you wish to add more as to the facts. We have had the description of the systems, and what we want now are the results. You say that this widespread gambling in produce has led to a depression in the price of produce, and we undertand that in your opinion this gambling system has led to the prevailing depression in the prices of all sorts of agricultural produce?—Yes, undoubtedly it has.

15,680. That is the point we wish to take now. *Primâ facie* it would seem that the more active market there is in any commodity the better the price should be, what we want to know is, why the contrary effect is produced in this case?—Although you have had the privilege of studying the whole of the valuable American evidence, given during the three years this subject was before that country, as well as the opportunity of reading my three publications on the subject issued last year, together with extracts from the British Press, I intend, with your indulgence and permission, to attempt to focus concisely, and I trust clearly, that evidence, so that it may bear upon the commodities grown in this country. I shall welcome cross-examination upon any point I raise as tending to elucidate my case, and I trust to establish the arguments I urge. You will observe, in the first place, that I do not agree with the popular notion that the value of English wheat last year has fallen to 24*s.* 8*d.* under natural causes or as a direct consequence of foreign competition in the shape of foreign importations. I know this is the general idea held by almost every farmer. Hence the cry in so many quarters for protection, their argument being, that given protection, the prices of foreign imported produce would be enhanced, and supplies of the same would diminish, which, as a natural consequence, would raise the market prices of English wheat. But, under the present sad circumstances it is an absolute necessity for this country to import three-fourths of her home consumption of wheat, owing to the fact that she is now only growing barely one-fourth. Further, the world's production of wheat for last year stands out as alarmingly short, should any nation under any sudden emergency desire to lay in a stock, each importing nation would then discover that the supplies of wheat and flour are absolutely insufficient, and a famine equal to that of 1891 would at once threaten them. In this latter year the world was almost denude of stocks, and was rescued temporarily from great difficulties, principally through the American and Indian crops of that year providentially proving to be extensive. But in spite of this sufficiency the injury to values for 1891 was done. For the gamblers in America and England made a "pool," and ran the price up during that year from 32*s.* 3*d.* to 41*s.* 8*d.*, a rise based solely on Options and Future Contracts, with the result that, as has also happened in the case of silver, sugar, cotton, copper, &c., &c., in fact of all other commodities similarly artificially enhanced in price, the pendulum swung around gradually to a purely artificial and panic value, perfectly unwarranted by the legitimate laws of supply and demand. The result was that the gamblers for a rise engaged in the grain produce markets of the world, received at that time, and since, such gigantic and ruinous losses that the bulls were demoralised, and were unable to stand up and turn the tables on the bears, who have remained masters of the situation since that period. Let me, therefore, emphasise strongly the following resulting fact. The financially crippled position of the bulls necessarily causes the extent of their operations to be crippled also, and, in consequence, bear selling in America and England against produce coming to light, coupled with the operations of the professional bear in both countries must far outweigh the power of the bull buying. For importers and foreign exporters being obliged to sell Options or Futures against produce are absolutely compelled to find buyers or bulls at some price to absorb their daily offerings whilst it is not compulsory for the bulls to buy even at a decline. Under these circumstances the inevitable result is a decline in values, which, under the pressure of the settlement, causes the majority of bulls also to join issue and resell. Hence a stampede, resulting in a panic, by which values are reduced down to one of mere sentiment, irrespective of price, or of cost of production. Such has been the true position of the Grain Produce Exchanges both in America and England during the last few years. In fact, the present position is the outcome, and to a very large extent is aggravated by the artificial rise in Chicago last year. At that period an American named Cudahy formed a syndicate to corner wheat. It was estimated that he had the control of no less than 11,000,000 bushels suitable for tendering on Option contracts, besides other large speculative holdings. The result was, that after a short-lived rise, an artificial panic took place. During the month of May, Options for that month in Chicago were quoted as equal to 6*s.* 5*d.* ex quay Liverpool, while wheat was selling in the latter place for the same month at 5*s.* 8½*d.* Hence the price of wheat in Liverpool was the lowest quoted in the world. Just prior to the failure of Cudahy and of his syndicate in the month of May, the price of that month's Options in Chicago fell in one hour 7 cents, being the most sensational break on record. I may here point out that the present value of wheat Futures ruling in America show 36 per cent. decline in comparison to the value ruling in Chicago before the panic. This panic has been re-echoed throughout every American and European Produce Exchange since that date, resulting in Futures and Options of wheat being sold in England and in America this year at the lowest point ever known. And remember, it is the value of this gambling paper contract, in the shape of an Option in America and a Future in England, that has regulated then and since the market prices of all actual stocks held by English farmers and merchants. For instance, during the late grain panic in America this year, which was another panic, say, from 1st February to 15th, which was a fortnight, the sale of wheat Options alone in New York reached the enormous total of 8,700,000 quarters, this being considerably larger than the total production of the United Kingdom. During the same fortnight only some 330,000 quarters on the spot were sold. Result, another panic in values all over the world. During the same period in Liverpool, the total sales of wheat Futures alone reached 585,000 quarters. In consequence of this panic the market price of English wheat has fallen to the lowest value of the past century, viz., about 24*s.* per quarter. To give you another example, let me refer you to the numerous cotton bull manipulations in Liverpool under similar circumstances, all of which have turned out disastrous to the producers. Remember wheat, maize and cotton are the three principal commodities subject to gambling in America and England. I could give you 50 instances of the latter article since 1878. All have had the same effect on values, but I may specially instance two cases which happened as recently as last year. The first is that of a Liverpool broker who held 2,000,000*l.* worth of produce in the shape of Future Contracts, against which not one pennyworth of actual produce did he ever intend to demand delivery of, nor had the sellers also any intention of delivering. This enormous gambling transaction was known to all, and everyone recognised with apprehension that sooner or later the same quantity had to be resold. Further, that even a slight fall in the market would render it impossible for this broker, who had no capital of his own worth mentioning, to find margins to pay into the Clearing House. The market *did* fall; re-selling commenced, and the inevitable smash came, accompanied as usual with the failure of the broker, and with a heavy decline in values. The above broker held the position of President of the Produce Exchange, and his clients, who were two clerks, were afterwards convicted of robbing their employers of 180,000*l.*, which sum had been paid to that broker on account of differences due on their gambling contracts. I may mention in connexion with this swindling operation, that in order to save a wholesale financial disaster, the Produce Exchange had to imitate the Bank of England's action in 1890, after the Baring collapse, but, I may add, in their case without any outside guarantee. The second case was that of a Jew operator who held about 1,000,000*l.* worth of Future Contracts. The result was similar when he failed, causing another artificial fall in values. I estimated in my book that the losses to the operators on the Produce Exchange, owing to this artificial decline, were in about three days 500,000*l.* Since then the actual amount in differences due on gambling contracts paid into the Clearing House have been made public—it is no less than about 600,000*l.* Is it right that farmers of any country should be ruined by such reckless and immoral gambling transactions, of which they have no knowledge whatever?

Instances of disastrous market speculations

Mr. C. W. Smith.

6 Apr. 1894.

Mr. C. W. Smith.
6 Apr. 1894.

15,681. I do not think we want any more illustrations?—I will come back to the grain market. I can prove the same effects to have occurred in every article of produce down to silver, and I am as strong on silver as I am on every other article of produce.

Silver.

15,682. (*Mr. Everett.*) Could you give it us on gold too?—Yes, I could. These are subjects I have written on for the last 15 years, and if you want my views on gold and silver, I could give them to you. I have them here in my printed statement.

Gold.

15,683. (*Viscount Cobham.*) The illustrations you are ready to give are all to the same effect, are they not, as those you have already given us?—In my statement I give you the facts from 1846 to 1894 to prove my case.

15,684. Is there any further argument on that head that you wish to bring before us?—I think I should like to add one or two points about wheat if you would allow me.

Population and production of wheat compared.

15,685. Yes, go on please?—Referring back to the grain markets, let us look at the position, with reference to another most important factor in the situation when comparing present supplies and values with those of former years, namely, in regard to the increase in population that has taken place, and what do we find? That during the decade of 1880–1890, the increase in the total wheat area of the world was absolutely less than three and a half million acres or at 16 bushels per acre, the annual increase in the yield would be only some 56,000,000 bushels, which with as little as only four bushels per head per annum, would supply no more than 14,000,000 people. Whereas during that period (1880–90) the United States and United Kingdom alone have increased the number of bread eaters by considerably more than that number. In the "Standard" of yesterday, you will see that a commission has been held in America on the very same subject that you gentlemen are sitting on here and that the evidence has been published. According to the evidence which has come out and been published the wheat area of America in 1881 was 37,000,000 acres and the population 51,000,000. In 1893, the population had risen to 67,000,000 while the wheat area had fallen to 34,000,000 acres. The average price was 119 cents a bushel in 1881 as against 53 cents in 1893; they bring that out the same as I work it in my statement and in my books. It came out in evidence there, and, as I say, it was published in yesterday's "Standard." Where then has sufficient increase in wheat cultivation taken place since 1880, taking into consideration the enormous increase of population and consequently of bread eaters, to warrant a decline in value of nearly some 50 per cent. And where also, may I ask, have the enormous over-supplies come from since 1891, remembering that the world during this latter year was almost denude of stocks, to warrant a continuous decline in values since that year of fully 30 per cent. Also another important fact to prove my case. In previous years, say for example in 1882 when the world's over-supplies for that year were gigantic, we witnessed prices standing at fully 40 per cent. higher than they do to-day. Remember in 1882 the systems I denounce had not been introduced into England. Yet with a world's surplus for that year of no less than 223,000,000 bushels, we had the average price for English wheat 45*s.* 1*d.* Last year, with a positive deficiency of no less than 26,400,000 bushels, the price of English wheat only averages 26*s.* 4*d.* These figures carry with them their own proof that there must be some most formidable artificial cause at work to induce such a subversion of the laws of supply and demand. I am ready to give you the figures in wheat for every case I possibly can, and I hope to prove them from 1846. It is all brought into my statement, I regret that that statement is so long. I have had 16 months' work on it day and night you may say, and I have written over 3,000 letters and three books, and you can imagine what is in the statement when I say that I consider that the evidence necessary to prove one's case is absolute evidence to prove it. What I have written in my statement is only what I have been writing for the last 10 to 15 years which is well known in the commercial world. It was when I saw that the systems which I prognosticated in land and everything were introduced in 1888 and 1889 in this country, and when I saw that the effects in this country were the ruin of it—for the fall in the price of wheat means the ruin of the country—that I considered it my absolute duty then to step forward to try to reach the people, I wanted to reach the landed interest and the farmers and the legislators in this country who are absolutely ignorant of the existence of these systems in the wheat trade and how they are ruining this country; and so I brought it before the country in the way I have done.

Mr. C. W. Smith.
5 Apr. 1894.

Proposed American legislation to counteract the effects of the systems.

15,686. Will you tell us what has been done in America to counteract the effects of this system?—I will. It is with the greatest satisfaction I can refer you to the pamphlet I have just issued, by which you will perceive that 99 per cent. of the press of Great Britain which reviewed the subject, support me in having brought it forward, and when I mention that it was at first tabooed by certain of our leading papers, and that it was only after careful consideration that it eventually received from them favourable reviews, I think it may be said that the powerful press of this country irrespective of politics, unite in considering the subject to be of the greatest importance, and well worthy of examination by all who are now engaged in weighing the various proposals and suggestions before the country for meeting the wide-spread disasters which have come upon us. Whilst on the subject of the press, let me recount the manner in which this question was received in America, during the three years it was before that country, prior to the actual passing of the Anti-Option Bill in the Senate House last year, and how very differently Mr. Wood Davis, the gentleman who in America engineered this subject, was treated by the American Press. Almost every American free and independent organ of public opinion was virtually bought up by the commercial and financial class, principally by the railway nabobs and gamblers of Wall Street, who, it is well to remember, are the biggest gamblers, not only on the Stock Exchange, but also in farm produce, and who are consequently as much interested in a continuance of these systems, as the members of the various exchanges themselves are. Hence, under these circumstances, no stone could be thrown at a grain gambler without hitting one of these railway magnates, and Mr. Wood Davis, who is, I may remark, one of the most powerful journalists in America, besides being one of the most capable statisticians and ablest of farmers, had almost the whole of the financial and commercial press closed to him, and antagonistic to his views and arguments. It is, therefore, with a feeling of the greatest gratitude to the press, and to others connected with that powerful institution in this country, that I have found myself enabled in so short a time to attain for this subject so prominent a position, for without such help I feel I could never have had a tithe of the success which I may gratefully say has attended my efforts. It is not a matter of surprise then that, under the above circumstances in America, it took Mr. Wood Davis and the Farmers' Alliance three years to convince the legislators of their country of the necessity of legislation, and for the American Senate to determine to pass an Anti-Option Bill. I may tell you that both in America and in Germany the Farmers' Alliance was started absolutely, solely, and only to force the legislature to protect their interest by the very Anti-Option Bill which is now before the country in America. I have correspondents in Germany, who tell me that the Farmers' Alliance has been established there, just like the National Agricultural Union in this country, in order to protect their interests, and with the one object of bringing the legislature there, that is the Reichstag, to see the necessity of passing a similar measure to that which the American farmers under their Farmers' Alliance put forward in America.

15,687. Is the bill before the American Legislature now?—Yes. Mr. Wood Davis had the great satisfaction of witnessing the nation's acknowledgment of the truth of his arguments and of the absolute justice of his assertions that these gambling systems were undeniably ruinous to their farmers and producers. Although this bill had to be shelved *pro tem.* by the House of Representatives, it is most important to draw your special attention to the fact that a similar measure, of which I have a copy, and which I will give you, was reintroduced in both Houses on the 15th of December last, but it partakes more of a revenue measure than the old bill, owing to the constitution of the Government which prevents the Central Government from prohibiting what the States have a right under their own sovereignty to attend to, still it is, if anything, stronger than the old bill, and Mr. Senator Hatch, who has charge of it, hopes to see it become law this coming April or May. I may add this bill was referred last February to the ways and means committee by the House of Representatives by no less a vote than 168 to 53, or a majority of over three to one, which means absolutely—there is no doubt about it as far as my

Mr. C. W. Smith.
6 Apr. 1894.

information goes—that the bill will become law in a great measure.

15,688. What are the main provisions of the bill?—That is the bill itself (*producing print*).

15,689. (*Mr. Chaplin.*) When was it referred to the committee?—I think it was on February 7th, 1894, that it was referred to the Committee of Ways and Means.

15,690. By what majority?—By 168 to 53—it was over three to one.

15,691. (*Mr. Channing.*) In the House of Representatives, I suppose?—Yes, and then there is a similar Bill which has been presented by Senator George, as far as I gather from America, and which will be presented in the Senate. It is simply a Bill dealing with the gambling and making it a misdemeanour. There will, therefore, be two Bills. I am not quite certain whether that Bill has been presented or not before the House, but the one of which I have a print has been presented and has been referred to the Committee of Ways and Means.

15,692. (*Viscount Cobham.*) Is the object of the Bill to prevent gambling in commodities?—All that Mr. Wood Davis and the Farmers' Alliances in America and Germany are doing, and all that I am asking you to do, is to prevent a man selling what he has not got. If he does sell it let him deliver it as was done when the systems were first introduced into this country, and which was absolutely legitimate business. It does not matter how the crops of the world are moved, but if a man sells let him deliver.

15,693. Is that the object of the Bill you have in your hand?—Exactly.

15,694. Just read the clause that enacts that?—There are several sections which dwell upon it.

Hatchs' Anti-Option Bill in the House of Representatives.

15,695. I suppose it defines "Futures" and "Options"?—Yes, it does in the first two sections. Then sections 6 says, "That special taxes are imposed as follows:—"Dealers in 'options' or 'futures' shall pay twenty-"four dollars. Every person who shall in his own "behalf or as agent broker or employée of another "deal in 'options' or make any 'options' contract or "make any transfer or assignment of any 'options' "contract or shall by letter telegram or other com-"munication sent from the United States to any "foreign country or by an agent broker employée or "partner resident in any foreign country enter into "any 'options' contract shall be deemed a dealer in "'options'; and every person who shall in his own "behalf or as agent broker or employée of another "deal in 'futures' or make any 'futures' contract or "make any transfer or assignment of any 'futures' "contract or shall by letter telegram or other com-"munication sent from the United States to any "foreign country or by an agent broker employée or "partner resident in any foreign country enter into "any 'futures' contract, shall be deemed a dealer in "'futures.'"

15,696. That is really not a revenue provision, but an absolute prohibition; that is virtually the effect of it?—Under the Constitution of America each State has a right to make its own laws; the central Government can only, as far as I can gather, have the power of bringing a revenue measure in of such extraordinary magnitude that it virtually taxes the whole "option" and "future" business out altogether. Therefore, they have had to bring it in as a revenue measure. It is a simple thing in this country. If legislation was to put 2,000*l.* or 5,000*l.* on dealings in "options" you would stamp it at once, because the Government of course have the power of authorising the legislation. I see in to-day's "Standard," for instance, that there is a paragraph referring to the Bourse transactions in Germany, stating that the markets went very flat yesterday owing to the increased taxes on the Bourse transactions. You know that France in the last 12 months has legislated in the same way, and Russia has done the same; therefore there is nothing new in the subject I am bringing forward. This has all taken place in the last 12 months.

15,697. (*Mr. Dalton.*) What is the amount of the taxes proposed by that Bill?—I think there are different amounts for different articles, as far as I can gather. They are very strict in regard to anything of a fraudulent nature. After making certain fines and taxes for the business, I see that anybody who breaks it at all is "liable for the amount of the tax or taxes "prescribed in this Act for each and every such offence "pay a fine of not less than one hundred dollars nor "more than two thousand dollars, or be imprisoned "not less than one year nor more than five years, or "be subject to both such fines and imprisonment."

Mr. C. W. Smith.
6 Apr. 1894.

15,698. That is if he does not pay his taxes?—Yes.

15,699. (*Viscount Cobham.*) Do you consider, with your knowledge of the business, that that Bill, if it becomes an Act, will not be evaded; do you think it will be operative?—I think so. America has absolutely been ruined by this system; there is not the slightest doubt about it, and America recognises it to a man; and no man, in my opinion, recognises it more than the President himself. You saw in his inaugural address last March how he dwelt upon it.

15,700. Do you think the Bill is certain to be passed?—I can only tell you that my advices are, and have been for the last six months, as strong as the last fact which I heard last week, which was that it had been referred to the Committee of Ways and Means by the House of Representatives by a majority of over three to one.

Probable effect on England of the American Anti-Option Bill.

15,701. What do you consider will be the effect on England of the passing of this measure?—In view of this Bill becoming law in America this year, it is highly important to study the position of England and the continental countries where these gambling systems are already in vogue. For what would be the result to the farmers of Europe should America transfer her gambling schemes to the Continental and English Produce Exchanges already in existence? When the Anti-Option Bill was about to be passed last year the American gamblers pointed at once to Liverpool, London, Hamburg, and to other continental cities as the future principal centres for their operations, and therefore at this juncture it is of considerable interest that the Berlin Farmers' Alliance, as will be seen by the letters I have already published, is quite alive to the great injury caused by the German gamblers already established on the Produce Exchanges in that country. We suffer similarly; our landed proprietors and farmers are being absolutely ruined and their industry wrecked by the same systems that the American and German farmers have already unanimously recognised as an unmitigated curse. And it is stated that both the German and French Ministers of Commerce intend to bring forward a Bill for the reform of business done on the Produce Exchanges of their respective countries. Of course France has done it; and, as regards Germany, in to-day's "Standard" you will see the paragraph I have just alluded to, which states that the market went flat owing to the tax being increased on the German Bourse. If this is authentic, and America, France, Germany, and Russia eventually procure some form of legislation in the direction I advocate for England, it will be absolutely essential in self-defence for Great Britain to protect herself against these changed conditions, unless she wishes to become the sole hell of the worst form of gambling, and in numerous cases of absolute falseness and fraud, that has ever been introduced into the commercial world. Even under existing conditions our Produce Exchanges are at certain periods the recipients of enormous gambling operations on behalf of both American and continental operators. And these systems are really far more detrimental to a free trade country like England than they are to other importing European countries, for, owing to the fact that the systems in America are carried on on a colossal scale, the values of all produce which we grow in this country and which come under these systems are regulated more or less entirely by the values ruling in the numerous gambling depôts throughout America. And, further, it is the value of this gambling option contract in America, combined with the value of the future gambling contract in England, which influence and determine the basis in every part of the world of all operations, either selling or buying.

15,702. So you are strongly in favour of similar legislation in England?—I say to-day, and I have said it for the last 10 or 15 years, if these systems continue they will ruin our country; they have absolutely ruined everything that they have touched.

Effect on English traders and importers of an Anti-Future Bill.

15,703. Would not the passing of a measure like that have the effect of driving the trade out of its present hands; the existing body of importers with small capital would no longer be able to do their business under it, would they; is not that the effect of what you have told us with regard to the hedging system?

Mr. C. W. Smith.

6 Apr. 1894.

—There are crowds of substantial houses which have been driven out of the trade, but which would be only too thankful to come into the business again if the system were altered.

Effect of a panic on importers with small capital.

15,704. The men of small capital would be driven out, would they not?—No, they could still do a certain amount of business, but not the enormous amount that they do now under this settlement of differences. If you have got 500*l.* and you get 500*l.* worth of actual stuff you do not go any further than you have already gone, using that capital as margin. You have to watch every single thing, and when panic comes you cannot stand any loss at all, for you have only got 500*l.* or 1,000*l.* of capital. Virtually the systems introduce, I think, nothing but men of straw really into the commercial world. The old-established merchant and banker, who was the importer and who did all this business on a legitimate scale, has been absolutely driven out of the trade, and it is an entirely new class of men who have come into the business.

15,705. Why should not the importers endeavour to cover themselves by selling actual cargoes forward?—That is done.

Effect of panics on importers and operators.

15,706-7. Why should they do more than that?—In a time of panic it does not matter who the man is if you have these symptoms in vogue, and you have unimported, we will say, three or four cargoes on your own account, or on consignment, or on commission—anything you like—all of a sudden something happens in the commercial world or the financial world to cause a panic. The moment you know that what do you do? You take the opportunity of hedging yourself in Futures. There is a panic on, but you knock the prices down and that reacts on the market again.

Probable effect of the abolition of the systems.

15,708. But if you abolish that system you would compel importers to cover themselves by the tender of their actual cargoes?—If you abolish the system, and a man has imported a thousand tons in the month of April, and has sold a July-August delivery against it, those thousand tons have to go against that July-August delivery and that becomes an actual tender.

15,709. Do you think that if the importers were men of sufficient capital that would meet all the necessities of the case?—Yes. There are lots of men who will go back again into business. I would go back again into business myself to-morrow if I could get it on a different scale. Crowds of men in London and in the country with capital have been absolutely driven out of trade. What is the use of being in business now? If you talk to any old-fashioned man in business he will say it is not business.

Legislation by France on produce gambling.

15,710. (*Mr. Chaplin.*) Did I understand you to say just now—I could not quite hear you—that a Bill had been introduced in France on the subject?—I will give you all the information I can give you about France; it is simply what I have read.

Legislation by France on Stock Exchange gambling.

15,711. Did you make the statement that it had been introduced into France?—I said that, as far as I could make out, it had been brought before the French, but whether it had actually come into law I cannot tell. On the Stock Exchange last year it came in; they tried to kill the *coulisse*—the outside stock business—by taxing it out. That did come into operation, and I have seen what the effect on the revenue in France of that tax has been.

15,712. There has been a measure carried then?—Undoubtedly, that is on the *coulisse*. As regards France, I have the following statement here:—"On "January 30, M. Vigier, Minister of Agriculture, "announced that the Government would the next day "present a series of measures destined to restrain "speculation. Those measures would comprise the "diminution of time during which wheat may be left "in the depôts which enables large speculators to "house wheat for several years. The proposed sliding "scale was rejected by the Minister because it would "lend itself to the machinations of the speculators. "The above measures were signed by President Carnot "on February 10th."

15,713. What was the date of that statement?—That was, I think, on January 30th—it appeared in the "Standard."

The American Anti-Option Bill and stamps.

15,714. (*Mr. Dalton.*) This American Bill appears to be mainly a Bill for imposing a stamp duty on contracts. It says in Section 7:—"Every Options contract and "every Futures contract shall have affixed thereto "internal revenue adhesive stamps representing taxes "as follows." Then you get, "For every 10 bushels "of wheat one cent"?—Yes.

Mr. C. W. Smith.

6 Apr. 1894.

15,715. Are the English contracts subject to duty at all at present?—Yes.

English contracts.

15,716. I mean your contracts that you were speaking of, your Future and Option contracts of which we are to have a copy?—I think every contract has a shilling stamp if I remember right.

The American Anti-Option Bill.

15,717. All that this Bill seems to do is to impose an *ad valorem* stamp duty on the contract of one cent for every ten bushels of wheat; that is the main part of the Bill is it not?—No.

15,718. And a 24-dollar license besides?—Yes.

15,719. But then a 24-dollar license would be a very small thing for a speculator to pay?—It is more than that as I will show you if I can get hold of it exactly.

15,720. Are those duties supposed to be prohibitive?—Yes, completely so.

15,721. (*Mr. Little.*) You say the object of the Bill is to drive these men out by taxation?—Yes, that is really the object, only they bring it in under a revenue measure. I think we have to pay a shilling stamp, and I think the shilling we pay goes towards the Government as well.

15,722. (*Mr. Dalton.*) Are your contracts which are entered into in England all stamped?—Do you mean Government stamped contracts?

15,723. Yes?—No, they are under the Produce Institution.

15,724. Is there any stamp duty on these contracts?—There used to be I know, but I am not quite certain whether there is now or not; it goes towards keeping up the expenses of the Clearing House I think.

15,725. There is no Government stamp at all you say upon them?—No.

15,726. Not a penny stamp even?—I do not think there is anything at all.

15,727. (*Mr. Channing.*) Is not the point this: that there is a small tax on each bushel of wheat dealt with in these Futures, and that that tax in the aggregate of the transactions would be so much as to deter the speculator from going on in the way that he has gone on; is that not the object?—Yes; in New York alone in one day this week they sold 17 million bushels of wheat.

15,728. At a cent on every 10 bushels, that means a tax of 17,000 dollars on the transactions of the day?—Yes; this bill is quite enough to prevent it. They are undergoing exactly the same thing in America now, and every financial and commercial institution is agitating against.

Effect of the systems in the price of wheat.

15,729. (*Mr. Giffen.*) How much do you think that wheat at 24*s.* is below the price that it ought to be if we had a proper working of supply and demand?—I consider that wheat ought never since 1880 permanently to have gone below 40*s.* on the world's supply and demand, taking the increase of population into consideration as well. Nobody can produce any figures or statistics in comparison with the time prior to the systems being introduced—1883—which would warrant such a reduction in values as has taken place, namely, 50 per cent.

15,730. The price has gone from 40*s.* to 24*s.* entirely through the operation of this pernicious system, as you describe it?—It has gone from 32*s.* to 24*s.* or rather more than that; in fact since 1891 it is down about 30 to 35 per cent.—since 1891—which is only three years.

15,731. You go further back than that, and you think that the price now would be about 40*s.* but for this pernicious system?—This year and last year it would have been higher, in my opinion, on the world's supply and demand if that were to be the regulating medium of values; the prices would be higher than 40*s.* to-day considering that in 1893 the world's stock showed a deficiency of 23 million bushels of wheat.

15,732. It is the existence of this system and the existence of that class of people—— ?—Combined with America.

15,733. Who are foolish enough to buy, which causes this great fall in the price of this leading article of production?—Excuse me, that is the second time you have mentioned it, but I have not quite caught your point on the question of these buyers or bulls. The

Mr. C. W. Smith.
6 Apr. 1894.

bull is a necessity under the systems. There is the absolute fact of the bear and the importer who has to sell whether he is in America, or England, or elsewhere. He is the cause of the decline. But the bull who buys his contracts also helps to cause the decline when he has to re-sell that paper contract.

15,734. Yes, but I do not see the necessity for a man being a bull?—If there is a seller of a contract there must be a buyer. There must be two people to a contract.

15,735. But why should there be a foolish buyer who does what is clearly not to his own advantage, but is to the benefit of another man, and to the injury of a very large class?—I can only give you the same answer that I have given to men who have asked me that question for 15 years, who are always buyers and never sellers, in England every man takes an optimist view the moment he goes into business; he is brought up to it, and quite right too, but he never recognises that under the systems a rise is an impossibility.

15,736. Then the existence of this class has caused the great depreciation in the value of wheat which you have described. What is the total production of wheat annually?—Of the world?

Estimated wheat product of the world in 1882.

15,737. Of the world?—The estimated wheat product in the world in 1882 was 2,367 million bushels.

15,738. How many quarters is that?—Divide it by eight.

15,739. 300 million quarters?—Yes.

Estimated wheat product of the world in 1893.

15,740. And now?—In 1893, according to Wood Davis, who is the greatest statistician in America, and according to Beerbohm, who is the greatest statistician in this country, the estimated wheat product of the world was 2,251,600,000 bushels.

15,741. Which is pretty much the same figure?—Yes.

15,742. We may take it at something like 300 million quarters?—Do not forget the increase of population. The requirements in 1882 were estimated at 2,144 millions, and in 1893 they were estimated at 2,328 million bushels of wheat, leaving a deficiency in 1893 of 26 million bushels.

Wheat requirements of the world.

15,743. Still, about what the world requires and what is produced is close upon 300 million quarters?—There is the increase of population to be taken into consideration.

15,744. I merely wish the exact figure; it is almost 300 million quarters?—Yes

Effect of the systems on the price of wheat.

15,745. Then the depreciation of price by the operation of this cause that you describe, as compared with what the national supply and demand would have fixed, is the difference between 40*s.* and 24*s.*, or about 16*s.* a quarter?—Yes.

15,746. That is to say, the difference is something like over 200 millions sterling in the annual price of wheat?—Over the world?

15,747. Over the world?—Exactly so; that is to say, that the price since it was 40*s.*, whether in free trade countries or protectionist, or gold or silver using countries, or anything else, for the produce of the world of wheat has been depreciated to that extent by the systems.

15,748. By the existence of these systems?—Exactly.

15,749. And the existence of the foolish class of bulls that you have described?—You will excuse me, but I do not see your point yet about the foolish class of bulls; I do not grasp that at all; the bull may have been very foolish to buy, but if you take the ordinary run of bull the Englishman is always a bull. Any man that goes into business is always a bull in this country.

15,750. I am merely speaking of him as foolish, because he invariably loses money?—Quite right, but he is not the sole one who does.

15,751. (*Mr. Long.*) I should rather object to the inference that the bull is a foolish man because he loses money. If the inference were correct, would that not be a reflection on the farmers in this country, many of whom are losing money?—The bull who buys on a Future or Option contract, buys it of his own accord to make money at it as a gambler, but the poor farmer is the sport of the gambler; he never buys anything; he has not a casting voice in the matter of ruling the prices of the commodity which he grows; it is the bull and the bear between them who regulate that price ahead; he simply stands and grows the produce in order to create this gamble.

Mr. C. W. Smith.
6 Apr. 1894.

15,752. (*Mr. Giffen.*) I will say, "this class of bulls." The existence of the system, and the existence of this class of bulls—I do not use any epithet with reference to them—have between them, according to you, made this difference in the value of wheat, something over 200,000,000*l.* per annum?—You speak of 200,000,000*l.*; I have not gone into it. You stated that as a quick record of the facts I have given you.

15,753. Surely you can calculate in a very short time how much 16*s.* per quarter makes on 300,000,000 quarters of wheat; that is all I have done?—Yes, and if your figures are correct what you say is correct.

15,754. Ten shillings on 300,000,000 quarters would be 150,000,000*l.*, would it not?—Yes.

15,755. And 5*s.* more a quarter would easily make it 200,000,000*l.*?—Yes.

15,756. There is no doubt about the fact; I am merely wishing to get on record that you are not startled by an observation of that kind, that the cause which you describe is sufficient to produce so tremendous an effect?—The effect of these systems has been in my opinion the absolute cause of the depreciation in prices in every part of the world where wheat is produced. Some countries may be more favourably influenced than others.

15,757. Well, you admit it is an effect of a very portentious and startling kind?—The largest part of the sum you have mentioned is due to these systems in my humble judgment.

15,758. That is to say, so much money is taken from the producers, and ultimately given to the consumers, who get their wheat at so much less?—Yes; but the consumers, as regards their loaf, have not benefitted to the extent that the producers have suffered by the drop of 50 per cent. in wheat. That is the most important point.

Profits of the middlemen and gamblers.

15,759. Who gets the benefit?—The middleman; I, as a dealer; we thousands of gamblers get all those commissions out of the producers, and the middlemen, bakers and other people, dealers in flour, and others. It virtually comes out of the producer's pocket.

15,760. Still you do not get any more than the wholesale price in the markets in which you deal, I suppose, so that it must be the middleman subsequent to the wholesale dealers?—I do not quite follow the question.

15,761. I think it must be quite plain. The question I am putting is, who gets the benefit; it must either be the consumer or some middle man subsequent to the dealer in the wholesale market?—You see the middleman, that is, the dealer on the Produce Exchange, does not make every day, and he does not lose every day, or they would all be bankrupt. He makes and he loses. The people who have gained largely are what I call middlemen. They are the bakers; they are the people like the butchers in meat—it is the same principle there; they are the people who are making fortunes out of it.

15,762. Either the bakers or the consumers have got the benefit then?—The consumer most distinctly has not, because when wheat was 40*s.*, the 4-lb. loaf was only a farthing or a halfpenny a pound more than it is to-day, when you can buy wheat at 24*s.*

15,763. How much difference should 15*s.* make in the price of bread?—That I have not gone into; but I mentioned in my statement on figures which I have gone into that it was only a question of barely a halfpenny more when wheat was 40*s.*, which was only three or four years ago.

15,764. Should it have been much more; is that not all the difference in the price of bread that the difference of 15*s.* a quarter should be expected to make?—No; as far as I can make out, and I have worked it out to a certain extent, it ought to make a considerably greater difference than that.

15,765. How much?—I have not gone into that fact exactly, but I do dwell upon it in this statement. Those are details, however, which I am perfectly prepared to go into.

15,766. This cause which you have described has made that great difference as between the producer on the one side and the consumer and the immediate middleman above the consumer on the other side?—It

has principally been at the expense of the producers of the world of wheat.

15,767. But somebody else has got it?—The dealers on the produce exchanges have not got it to the large extent that the bakers of this country and other countries, the middlemen, whether they are dealers in flour or in the bread itself, have got it. Those are the men who are making the profit, in my opinion.

15,768. The millers and consumers between them throughout the world receive this 225 millions sterling per annum or something like that in consequence of the operations which you describe?—They receive the greater part of it at the expense of the producers.

15,769. But you do not like to say that they receive almost the whole of it?—There are so many handlings of it from the time the produce leaves the farmer in America, do you see; you cannot compare India with Argentine or Argentine with India. Why, in India alone, the ryot, who is the farmer of India, has another heavy debt to pay, and he owes large sums of money to the country bankers; they are the people who are making money out of those poor people.

15,770. Still the middleman and the baker and miller in this country are the wholesale people in the market, and they are all paid out of the 40*s.* or the 24*s.* respectively, whatever is the wholesale price?—Take the ordinary run of farmers in America; they themselves are in the hands of these Jews who are nothing more nor less than money lenders, and they all get a bit out of it before it leaves their hands.

15,771. They are all paid out of the 40*s.* or 24*s.* respectively?—It all comes out of the land, undoubtedly—it is all at the expense of the land.

15,772. But this 225 millions sterling is entirely a benefit on the other side of the account to the middlemen (after the goods leave the wholesale market) and to the consumers?—As far as the consumers of this country are concerned you must remember that according to all political economy the largest consumers of the country are producers, and that if you are going to ruin by any artificial means the value of the produce of the land you deprive those men of their purchasing power as consumers of this country, and as the bulk of them are consumers you ruin by that means the producers.

15,773. I am not going into that question at all just now; I wish to get at the facts?—I do not quite know what you want to get me on, as it were, and keep me fast to, but still this sum of money is distributed amongst the money lenders; and the producers in most cases in America and in India are in the hands of these men. Some of the money sticks to those men, other portions of it stick to the bankers, traders, dealers, or manipulators in options or futures before the produce comes absolutely to the consumers of this country. But I wish to emphasize the fact that whether it is Argentine, or Russia, or India, or England, or the continent of Europe, this sum of money, which is the result of these systems of depreciating the values, all comes out of one pocket, that is the producer's. He is the loser; he is made the poorer by it.

15,774. But still you admit that as between 1882 and the present time, or something like that, this fall of 16*s.* in wheat is for the benefit of the millers and people of that kind—millers, bakers, and consumers of the wheat?—I do not say so much for the millers. I do not call a miller a middleman. You must remember that these systems are in flour as well as in wheat. They are dealers.

15,775. Are we to say the bakers and consumers then?—I think that is more narrowing it to the limit that I wish.

Consumption of wheat in the United Kingdom.

15,776. On the consumption of wheat in the United Kingdom how much would that be?—We are consumers of something like 29 or 30 million quarters, are we not?

15,777. Take it at 30 million quarters; the gain to the consumers and bakers of the United Kingdom would be something like 20 million sterling, would it not or more?—They might, if they looked at it in a very narrow way, consider it as their gain, but it is their dead ruin, in fact.

15,778. Still, as a matter of absolute count, suppose it goes on for 10 years, then 20 million sterling per annum would soon come up to 200 millions sterling?—Yes.

15,779. I do not quite gather from you the difference between the system of speculation which goes on in "Futures" and "Options" in the grain market and other markets, and the system of speculation which goes on in the Glasgow pig iron market or on the Stock Exchange. One of the things on which you laid stress was that people sold what they had not got?—Yes.

Difference between gambling in pigiron warrants and Options and Futures in food products.

15,780. That surely is the characteristics of all speculative markets—on the Stock Exchange people are continually selling what they have not got?—I am quite aware of that.

Difference between Stock Exchange gambling and the Options and Futures systems.

15,781. Then in that respect the markets which you describe are not different from the Stock Exchange markets?—Yes, they are very different in every way, London and North Western Railway Stock is not an imported article.

15,782. Yes, but they are quite alike in this respect that people sell what they have not got?—And are a cause of great ruin to this country by doing so.

15,783. But still they are not different from the speculative markets which you describe in the respect that people sell what they have not got?—Yes, they are very much different.

15,784. Will you admit that the Stock Exchange is not different from other markets so far as selling things which people have not got; as I understand the difference upon which you insist is that people sell things which do not exist, is that so?—Yes, they have not the slightest intention of its ever existing for the simple reason that I have already told you.

15,785. Then do not people on the Stock Exchange sell things which they have not the slightest intention of ever delivering?—I will admit that gambling on the Stock Exchange is answerable for the most serious losses of this country by depreciating stocks, but it is not an imported article like wheat and other articles of produce. The whole position is entirely different.

15,786. I do not think you are touching at all upon the point; do you insist upon the fact that people selling what they have not got is the cause of mischief, or do you not?—Very largely so. There is only one class of man, that is the bear who never has anything under the systems. Before the systems the bear was not known in the commercial world; it is only since 1883 that the bear has been known in the commercial world.

15,787. You told us also in reply to previous questions that you thought this statement of "Options" and "Futures" in the grain market and in the cotton market was very much worse than anything on the Stock Exchange and I wish to know what it is?—I say in my book on "Commercial Gambling":—On page 22 of my previous book I specially referred to the argument of how all railway and other investments would be affected if such stocks were imported and hedged year after year as produce is now, *i.e.*, on the basis of the Option, Future, and Settlement systems. Fortunately for investors they are not, for the great difference between the two is that the stocks of railways and other securities are simply held by individuals as investments pure and simple, the interest on the same and the value being regulated by the state of trade principally, and by other considerations. Hence all investors and capitalists ought to be interested in the question at issue. I may state the original stock of railways, &c. remains in one interest virtually, for if one interest sells out another buys it and pays for it, and except in times of financial panics the sound securities thus held nearly recover the temporary drop they had owing to the said panic. For, remember, there is only one original stock, and consequently, whatever harm the speculators, gamblers, and jobbers on the Stock Exchange may do by their gambling operations between the fortnightly settlements (and immense harm is done, as shown palpably by the state of the New York and London markets lately), the fact remains that there are no Futures or paper contracts to govern the value of the original stock, as is the case in produce, and these must be resold at the best price obtainable by the speculators as the said month's deliveries come round. And, remember, the value of such on the day solely regulates the values of the actual stocks.

15,788. Is it quite true of stockbroking transactions—are there not cases where sales of stock which the people would sell have exceeded by two or three times the total amount of the stock in question?—Yes,

Mr. C. W. Smith.
6 Apr. 1894.

I have never had a transaction, except an investment tra saction, with the Stock Exchange, for I looked upon it as, with closed doors, about the biggest swindle in this country. Why do not you stop, as France is doing, and Germany proposes to do, your outside stock-brokers, who never deal in one single ounce of actual stock, but who are what you call outside jobbers? Remember, if you want to invest money to-day or to-morrow on the London Stock Exchange, 10,000*l.* say, in London and North Westerns, what do they do? They go to the outside jobber, and you will find that the price you buy at, if you are a buyer, is the highest price quoted in to-morrow's "Times" on the London Exchange. If you are a seller, you will find that you get your price at the lowest price quoted. The jobber outside makes the price accordingly in order to get that 10,000*l.* on which he plays in the market for two or three days.

15,789. But still you admit that there are immense transactions on the Stock Exchange when people sell what they have not got, and other people buy what they have not money to pay for?—Enormously so.

15,790. And that these transactions regulate the price to a very large extent?—Naturally to some extent, but that only in securities which are rotten and speculative—sound investments, as a rule, do not. You may sell a 100,000 million Consols, and the man who sells them is ruined. That is why Consols are at 100 to-day—par, for the first time for many years. But I will smash any market on the Stock Exchange with money behind me in a rotten gambling affair where the holders of those papers have not bought for investment, but only for a gamble in prices. It is applicable in that case, the same as gambling in Futures and in Options. But that is the exception on the Stock Exchange. Anything of a solid nature after all, whether you are long or short, on the Stock Exchange has to come back.

Effect of the abolition of the systems.

15,791. Is not wheat of a solid nature, and if it falls below its proper price, are there not many people who have money who would be anxious to buy it?—Why do they not buy? If the people who gamble in Futures and Options would buy the actual stuff you would go back to old times prior to the introduction of the systems, and the price of wheat would soon tell you the real price based on supply and demand.

Mr. C. W. Smith.
6 Apr. 1894.

15,792. As far as the buyer is concerned he can insist on delivery of actual stuffs?—He hardly ever does, as explained.

15,793. What is to prevent him?—He never does. He is a gambler in the prices of commodities; he never wishes to see the wheat, he never wishes to see the cotton, he never wishes to see the sugar.

Difference between Stock Exchange gambling and the Options and Futures systems.

15,794. I suppose on the Stock Exchange there are many people who never wish to see 100*l.* of stock, or anything of that kind?—One of the curses of the Stock Exchange is the gambling, and I consider that you have seen that pretty well exemplified in the Baring collapse of 1890.

15,795. That is the point I was coming to. You insist that this gambling in these particular articles depresses the price so enormously?—Yes.

15,796. Has it the same effect upon the Stock Exchange?—Most distinctly not, because on the Stock Exchange there are no Futures and Options in the way.

15,797. But there are Futures and Options of a kind?—But it is on quite a different basis. You must take the gambles on the various bases on which they exist. I have explained to you that copper, iron, and tin, and the gambling in warrants is on quite a different basis to the gambling in cotton and sugar and other commodities, and I have explained to you that the gambling on the Stock Exchange again is on an absolutely different basis to the gambling in an imported article like wheat or cotton, or sugar, or other things.

15,798. What is the nature of the gambling that depresses the price in one case and does not depress it in the other; that is what I wish to get at?—You do not import London and North-Western Railway Stock and other securities. It is not an imported article. The stock is in existence here. You can gamble in the price of that, but you do not import it and bring it from America and Argentine on the basis of this contract, which is only a bit of paper contract.

The witness withdrew.

Adjourned to Thursday next at 12 o'clock.

(For Mr. C. W. Smith's further evidence *see* Question 19,628, p. 291.)

Twenty-eighth Day.

Thursday, 12th April 1894.

PRESENT:

The Right Hon. GEORGE JOHN SHAW-LEFEVRE, M.P., in the Chair.

Viscount Cobham.
The Right Hon. Henry Chaplin, M.P.
Sir Robert Nigel Fitzhardinge Kingscote, K.C.B.
Robert Giffen, Esq., C.B.
Captain Owen Thomas.
John Clay, Esq.
Robert Lacey Everett, Esq., M.P.
John Gilmour, Esq.
George Lambert, Esq., M.P.
William Outlack Little, Esq.
Charles Whitehead, Esq., F.L.S.

Herbert Lyon, Esq., *Secretary.*
R. F. Crawford, Esq., } *Assistant*
Freeman Thomas, Esq., } *Secretaries.*

Sir G. Goldney.
12 Apr. 1894.

Sir Gabriel Goldney called and examined.

15,799. (*Sir Nigel Kingscote.*) You are a landowner in Wiltshire, I believe?—I am.

15,800. About what extent of land do you own?—I have lived there a great many years, and I hold land in Wiltshire, Somersetshire, and Gloucestershire to the extent of somewhere about 2,700 acres in different localities, mainly in Wiltshire and almost entirely in North Wilts with the exception of one farm.

Extent of land in hand.

15,801. Have you any of that land in hand?—I have two farms in hand, and have had both these farms for a period, one for about 10 years, and the other, which has more arable with it, for a period of seven or eight years.

Sir G. Goldney.
12 Apr. 1894.

15,802. May we ask about the extent of those?—The extent of the one that is near Chippenham, which is part of my Stanley estate, is 215 acres, and the extent of the other farm called Bradenstoke—the Abbey Farm up there—is about 350 acres.

Characteristics of farms.

15,803. Can you give us the proportion of pasture to grass and arable?—In the Stanley farm, I think the extent of the arable is about 35 acres, and in the Bradenstoke farm, which was perhaps two-thirds arable and one-third pasture; for the last three or four years we have made more into pasture, and it stands now half and half—perhaps there is

Sir G. Goldney.

12 Apr. 1894.

rather a tendency more to pasture than to arable. As regards both farms there is a certain amount of irrigation. On the Bradenstoke farm I am now utilising—by having it turned down to pasture—some large springs and ponds, which enable us to water somewhere about 25 acres. On the Stanley farm we have simply a sewage irrigation; that I will explain by and bye when I give a little more evidence respecting it.

15,804. When you took these farms were they in a bad condition?—When I took the farm at Stanley it was in an exceptionally bad condition. It is rich pasture land, natural dairy land, but it was so bad from the neglect of a previous tenant that a quantity of rushes, which we call bull poles in our neighbourhood, had dominated the grasses to an enormous extent. The first thing we had to do was to denude the ground of this incubus. My present bailiff, who is a man that I took there, and who is a very intelligent fellow, calculates that we took up in the course of three years with a particular hoe that he invented 5,000 waggon loads of these bull poles—I put it at 1,000, but he said, "We have taken up 5,000." That was converted into manure by having some three or four large boat loads of lime, and, where the railway goes, truck loads, and putting the bull poles into immense heaps the size of this room and mixing lime with them. The next year they were all powdered and we have used them for the greater part of the manuring.

15,805. Then, as a matter of fact, you have laid out a great deal of capital on both these farms?—As a matter of fact I have laid out a comparatively small capital in that way. With the exception of lime and one small quantity of bone dust that we have put on one of the fields we have had no artificial manures at all there. We get the gas lime from the town, which is the best sort of manure for that rich pasture land with a clay soil. The theory of my bailiff, which he has proved to be a successful theory, is that a farm to pay in these days must maintain itself, that is, that you must not go outside to buy things with money, and that the duty and first object of a man who is managing a farm should be to economise the manure from the farm itself in every possible way.

15,806. Do you spend any money on draining?—Before my bailiff came in I had drained the whole place at a cost to the extent of 4,000*l.* or 5,000*l.* I drained the whole of the Stanley estate, which is somewhere about 1,000 acres, we will say, taking the money from the Government for a period of 21 years, and all that has been paid off, and I believe the drainage is in a most perfect state. The drainage was 6 feet deep.

Mode of culture.

15,807. What is your mode of culture? Do you dairy; do you breed stock, or what?—Our mode of culture is for milk entirely—for dairy cows. We never fat a cow. When a cow is not giving the right quantity of milk, we sell her and buy others. I was going to mention to the Commission with regard to this particular farm of Stanley, that when I took possession of it the previous tenant evidently had not got enough capital; he had 29 cows, a bull, and three horses; that was the extent of his stock. He had no sheep, and we do not keep sheep much there. I have now on the same land and have had for some time 87 cows, two bulls, and six horses. Then in addition to the draining that has had to be done, I have concentrated the yards. The great defect in our country on some of our farms at the present moment, is that of having the area of the yards so large that the manure gets wasted. We have so far concentrated the yards that the rick-yard has been brought into what was the cow-yard for instance, and the size of each of the yards, apart from the skillings, is very little more than the size of this room. The consequence is, that we have all, that which comes from the skillings, stables, and the roofings, put into two large tanks, each of them, perhaps, of the capacity of nearly half this room, which enables us, one being on one side and the other on the other, to irrigate certain portions of the pasture with the sewage. From that we hope to get four or five crops a year, and we do get practically that. Everything that comes from the skillings runs into these tanks, and when there is a good glut of rain the tank hatches are drawn and the land flushed in the same manner as water meadows.

15808. To make all these buildings and tanks, and to do all this draining you have, as a matter of fact, spent a great deal of capital?—We spent a great deal of capital to begin with, there is no doubt; and that is what I want to say, that I believe one great thing to do at the present time is to encourage in some way or other the importation of fresh capital.

Sir G. Goldney.

12 Apr. 1894.

Profits from farming.

15,809. Will you kindly tell us the result of all this, pecuniarily, I mean?—The result on this particular farm has been that I have had my old rent of 2*l.* 5*s.* an acre paid punctually every half-year—I treat myself as a tenant, and pay the rent every half-year through the agent to my private account. I do not suppose that I have spent in stock more than 1,300*l.*, or 1,400*l.* at the outside. The farm itself has paid for the balance of the stock, and has also lent me 600*l.* to go to the Bradenstoke farm, and there is a standing balance always at the bank of somewhere about 400*l.*

15,810. (*Mr. Little.*) Do you mean 600*l.* in the year, or 600*l.* in a series of years?—In a series of years—over the 10 or 11 years that we have been there.

Rent.

15,811. (*Sir Nigel Kingscote.*) What was the rent of the farm previously?—At the same rent that I am speaking of, 2*l.* 5*s.*, tithe free.

15,812. The last tenant paid 2*l.* 5*s.* an acre?—Yes.

15,813. In what year was that?—It must have been, I should think, somewhere about 11 years ago.

15,814. And that rent you have debited yourself with ever since?—That same rent I have paid ever since—it is carried into a rental account; the agent who collects the rent debits this account with it. The system that we adopt is this: that everything connected with the farm that is received goes into a separate bank account kept for this particular farm, there is a separate account for the other as well; otherwise, you would never know what is going on.

Interest on capital.

15,815. Do you charge interest on the capital laid out?—A certain amount of capital laid out I took from my own private resources at the beginning.

15,816. Do you charge in the farm accounts the interest on that capital?—No, we have not charged any interest on that capital. The bank account is simply an account that has been going on now for 10 years, and includes everything received from the farm, mainly from milk.

15,817. Are you satisfied that this large expenditure of capital to begin with, and this putting everything right upon your farms in your sense does actually pay, or has actually paid you?—It has actually paid, and has been very beneficial in every way.

System of farming.

15,818. Yours must be exceptionally good land?—This is very good land, but it has been made good land entirely by the importation of capital and skill into it—both. I will speak presently of the other farm, where it has been just the contrary way. The theory of the man who is the bailiff there is, as I said before, to make the farm maintain itself, and that it can do if it is properly managed, and if there is forethought—for instance, if the ditches are looked to, and the mouths of the drains are kept open. This was an old Monkish place, and we have adopted exactly the same system that the Monks adopted. The drains being six feet deep and the subsoil a clay, the water will not percolate quickly enough to relieve the land, and, therefore, in addition to the underground draining, every year we cut our furrows about six inches wide, from which the top water can all run off, and that helps to clear the land.

15,819. In fact you make it almost an irrigation farm?—That top furrow does not go to irrigation, but it relieves the land from a surplus of water.

15,820. Your great principle, as I understand it, is, that you make all your own manures and all your own feeding stuffs?—Yes.

15,821. And you do not buy any artificial manure or feeding stuffs?—If you buy artificial feeding stuffs you should pay for them from the produce of the farm itself. This very year, when Russian barley has been so cheap, and oats have been at a good price, this bailiff had a little consultation with me; he said, "I "can go and sell my oats," which he did, "at 24*s.* 6*d.* "a quarter, and I can buy Russian barley delivered in "at 13*s.* 9*d.* a quarter;" that he has done, and there was a certain quantity of maize too. During this scarce season for hay, or comparatively scarce, for we happened, luckily, to have had a good deal, he has fed these 86 or 87 cows almost entirely with the oat-straw that he had left, with the barley meal that he had ground up from this Russian barley, and with roots and turnips, which produced a larger quantity

Sir G. Goldney.

12 Apr. 1894.

of milk than if he had been feeding in the ordinary way.

15,822. Are you of opinion that this system of farming, if there is capital at the back of it, can be carried on in most parts of England?—Yes.

Extracts of accounts of a farm, 1739 80.

15,823. Will you give us your reasons for that?—If I should not be intruding too much upon the time of the Commission, in further answer to the questions you have already put, I have a very remarkable statement to make with reference to existing prices and the existing rents, and the probability of careful management coupled with a knowledge of matters proving satisfactory. When I purchased a property comprising the rectory manor of Corsham I came into possession of the books of a Mr. Neale, who owned a very large property in Wiltshire, Dorsetshire, and Gloucestershire, who was a very careful man. His account-books I have beginning with 1739, and going up to 1780, showing the different farms, the rents, the names of the tenants, the amount of stocking, the course that the landlord adopted, and what the tenant adopted, and the result in cases of distress, showing what the stock and effects realised. It is one of the most valuable pieces of information for comparison with the present time that I think the Commission could have; I know the farms. He states the rents at that time, and I know the rents now. At that time money was very much more valuable, but the rents were very nearly identically the same as they are at the present moment.

15,824. Can you put that information in for the benefit of the Commission?—Yes. (*Handing in document.*) This paper contains extracts which have been taken by me; they are extracts from his ledger. These extracts run over a period of 30 years. It seems that during that period the tenant did the repairs, and in most cases paid the tithes, but the landlord paid all the poor, highway, and church rates. The rates are set out in detail. The prices of commodities were very small. Wheat was about 15*s.* and 16*s.* a sack; butcher's meat in some cases was as low as—beef at 2½*d.* The wages were only 6*s.* a week, but then the poor rate seems to have supplemented those wages in the cases of large families and in paying the rent of the cottages. There are two appendices that I put in with it. One shows the results of a sale under a distress; there were several instances of sales, but I have merely taken one. The price of cheese seems to have been remarkably low in those days, and yet it was a commodity which most of the farms seem to have relied upon; cheese in many cases was only 26*s.* and 27*s.* a cwt.

15,825. I have it here, in one part of this paper, that you have handed in, at 15*s.* per cwt.?—It was in some particular cases; I have given a series. Pork was about 4*d.* a pound. Hay at one place is shown to be at 28*s.* per ton, and at another place 30*s.* per ton. Then straw for the keep of beasts is put at 8*d.* per week, and there seems to have been a system of letting out horses and hiring them.

15,826. I think we should want the date put on this paper; but perhaps you will be good enough to fill in the date afterwards?—The paper covers a series of dates; it runs through a period of 30 years. I have marked the date in the margin.

System of farming.

15,827. Now, perhaps you will return to the question I asked you as regards your opinion upon this system of farming being carried on in other parts of the country or in poorer soils than where you are?—It is very difficult to answer that question. As regards my own lands I can speak. I think they have been carried on fairly well. I may mention with regard to these manures and feeding stuffs that at my Bradenstoke property they adopted an entirely different course, that is, they went in for feeding stuffs and manures and the result has been that during the last three years I have had no rent there and have lost a sum of 200*l.* or 300*l.*

15,828. You are still speaking of your own farm?—One of my own farms. As regards the Stanley farm where we have abstained altogether from feeding stuffs and artificial manures and where we have relied upon the farm, we have succeeded to a wonderful extent and have paid for half the increase of stock there and realised a net sum of 1,000*l.*—the 600*l.* I have mentioned and about 400*l.* balance at the bank. But at the Bradenstoke farm, where we adopted a totally different course, although in laying down to pasture, I had that amount charged to the estate account, and not to the farm. That farm has resulted in the last three years in no rent being paid and in a loss certainly to the extent of 300*l.* besides the rent.

Sir G. Goldney.

18 Apr. 1894.

15,829. On that farm your bailiff bought in artificial manures and artificial food?—Yes. The present bailiff tells me that he is tempted in every way: agents come offering all sorts of commodities, but he is adopting the same plan as the other bailiff I have mentioned and is working in unison with him and hopes to make the farm maintain itself. At the present moment what is wanted is an inducement to capitalists to import capital into land. In my early days, say from 1839 and 1840 up to about 1865 or 1870, the ambition of every man who made money, either professionally or in commerce, was to go and invest the larger portion of it in land. For an area of 12 miles, taking Chippenham as a centre, during those 30 years every portion of the land with the exception of two residential estates was acquired by people who had money, and who spent it in building farm-houses, homesteads, skillings, cottages, roads, and material improvements to an extent of expenditure quite, to my personal knowledge, equal to half the fee-simple value, and that without looking for any interest upon it. I believe that developed the resources of the district to an equal extent, that is, it has doubled them. My idea is that you really want at the present moment to get more capital into the land and more stock upon the land, and to facilitate the keeping of that stock by improvements.

Want of capital.

15,830. Taking the district that you have just spoken of, are the farmers there at the present moment helped a good deal by this large outlay upon buildings; are they in a prosperous condition?—I think they are to a great extent. Take one thing that I have endeavoured to do on all my farms, and which is going on in the neighbourhood, that is making closed skillings for the cattle in winter——

Outlay on buildings.

15,831. Still spending money on buildings?—It is not very much. The skillings existed, but they were open skillings. The opinion of several men that I have spoken to, my own farmers in particular, is, that the warmth of a closed skilling saves one-fourth of the food during winter, that is, the animals have not wanted food to generate heat when the skillings have been closed the whole of the winter.

15,832. Are the tenants in that district—I am speaking generally—paying the same rent as they paid at the time you speak of, 20 or 30 years ago?—No. During the last three or four years considerable allowances have been made and holdings adjusted.

Reduction of rent.

15,833. I am speaking as to your knowledge of the district?—They are, I should think, paying about the same rent that was paid at the time I was speaking of, viz., when the properties were purchased.

15,834. Surely rents have gone down very much in the last few years?—Yes; but then they had gone up very much.

15,835. You are comparing the present time with 30 years ago?—Yes.

15,836. Before the agricultural depression began?—Before the agricultural depression began. Then rents were very much in excess of what they were in 1840, 1845, and 1850.

15,837. Is it your opinion that with rents adjusted the farmers can farm to a profit in that district on present prices?—Yes.

Farming to a profit.

15,838. You think so?—Yes, I do. I think so, based to a great extent on these extracts that I have given you to show that the rents at that time were about the same as they are now, and that the saleable value of the produce was not half or anything like it, based also on my own particular instance of the farm I have mentioned at Stanley.

15,839. You still think that more capital put into the land would be beneficial?—I still think that the land is capable of bearing a great deal more than it does at the present moment. I believe further that the great objection with men to putting their capital into it now is the uncertainty that they have with regard to the Agricultural Holdings Act and other matters connected with it.

Want of capital.

The Agricultural Holdings Act.

15,840. Are you speaking of the tenants now?—No. I mean that London people for instance, will not import money into land. No man in London will look at the thing. In the first place men say "I do not want to go " and be cursed"; in the next place there are all these squabbles. Directly a man comes into a farm he begins

Compensation.

Sir. G. Goldney.
2 Apr. 1894.

to think what his compensation will be on going out, and as soon as ever a notice to quit is given to a man there are half a dozen men who come and offer to make out claims for him, just the same as in a railway accident, and these touting men say "You do this," "You do that." I have had two this last year. One man who left a farm in the neighbourhood of Bath sent in a claim for nearly 150*l.*, I think it was, and we had to go to a reference, and it came out that 10*l.* was the very utmost that he was entitled to. My idea is that there should be perfect freedom of contract so that the landlord who has got five-sixths at all events of the joint stock affairs in the holding as compared to one-sixth of the tenant should have something to do with how that land is to be improved or dealt with, and that it should not be at the absolute will of a tenant, who may be chemically ignorant, to say "I will go and buy this, that, and the other" and come to you at the end for repayment.

15,841. Then you would have no Agricultural Holdings Act; you would have no legislation; you would have simply an agreement between the landlord and the tenant?—I want to let the basis of the Agricultural Holdings Act stand, but that there should be freedom of contract so that a landlord may say, "I am "willing to encourage you. I will do what I can; let "us talk it over and see what is desirable for this "land."

Want of capital, and freedom of contract.

15,842. You must have some agreement?—Yes, but before you will be able to get an importation of capital into the land, that is by wealthy men coming and investing money in the land, you will have to make an arrangement, too, so that there will be freedom of contract between owner and occupier as to what the occupier is to do with regard to the land he is taking.

15,843. And you think that if this were carried out there would be capital coming into the land?—I believe there would. What I gather from commercial men and professional men is that they will not buy trouble.

15,844. (*Viscount Cobham.*) As I gather, you think that if the position of the landowner were made more secure and comfortable plenty of capital would come in irrespective of the question of the return from that capital?—Yes, I think so. I do not think with regard to what I mentioned at the beginning about the large amount of capital, the hundreds and thousands of pounds that were changing hands during the period beginning, we will say, from 1835 to 1839, that men then ever looked to a return on that capital with regard to farm buildings, and cottages, and roads.

15,845. But there are a large number of landowners who must, necessarily, look to their rents for their livelihoods; is that not so?—There are a large number of landowners at the present moment who are pinched by all these claims of settlements and moneys to be raised for younger children, and a variety of things; there has been a trying time for them, and a great many of them would be glad to get moneyed men to come in, but moneyed men will not come in merely to buy trouble.

15,846. You mean the more embarrassed and impoverished class would be glad to sell?—Yes, but to induce people to buy freedom of arrangement is wanted so that the man who has a five-sixths interest in the affair should be consulted at all events.

15,847. Do you think that a great deal of money has left the country which would otherwise have gone into the land?—Yes, I think that a very large portion has. That very observation you are making occurred to me only the other day. I was speaking to a very wealthy man, who had made a large sum of money, and he said "I would rather put my money into Greek Bonds or "Argentine things; I know the worst of it then; I "don't get my interest, but I am saved from being "cursed or being denounced as a man robbing the "poor." It is this disparagement of general things with regard to landowners that has frightened and stopped these men, and I do not know that for the last 30 years anyone of importance has gone into it, although I believe men would go into it. With the tenants now the prominent thing is compensation on quitting. Another thing that is talked about is the

Ground game.

Ground Game Act. It is not so much that owners care about the shooting now, but giving this joint right to the landlord and the tenant in hares and rabbits, has produced, in a great many cases, an enormous increase of rabbits. The object of the Act was to stop the tenant being injured by the rabbits, but a great many of the tenants' sons like the amusement of shooting and preserving rabbits. I forget which clause it is, but by one of the clauses of the Act you must not trap rabbits, or poison them, or shoot them for an hour after sunset or before sunrise. Sir Nigel knows a place with some woods round it, where I have been obliged, in order to protect myself against other people's rabbits, to put up miles of fencing. Rabbits, in some districts, have got so numerous that they feed like a flock of sheep. On that Bradenstoke farm I have got five acres of wheat which was most promising, but it is as bare as that box. Both these matters want fairly considering—the Agricultural Holdings Act as regards freedom of contract, and the Ground Game Act.

Sir. G. Goldney.
12 Apr. 1894.

Profits from farming

15,848. (*Mr. Whitehead.*) I think you said that you had made 600*l.* upon the Stanley farm in a certain period?—Yes.

15,849. Would you say how long that was?—I think I had the 600*l.* six years ago.

15,850. How many years' profit would that 600*l.* represent?—As near as I am able to make out the account it is this: I have had that in hand, we will say, about 11 years, but all this bull poling and manuring of the land, and breaking it up for a better state of cultivation was paid out of the farm itself, and of the increase of stock the farm has paid one-half and I have paid the other half.

15,851. Could you tell me how much profit per annum the 600*l.* would represent?—The profit would be about 150*l.* per annum.

15,852. That would not be very much profit for a tenant of 215 acres, would it?—The bailiff has had his salary and his house out of it, you know.

15,853. But the landlord has taken the rent?—The bailiff gets 90*l.* a year and his house and milk and a variety of garden stuff and so forth. The 600*l.* might represent 200*l.* a year—it was in about the first three years that I think it was made.

15,854. In spite of having an unlimited capital—any capital that you would like to apply to it—you have only been able to make 150*l.* profit?—It is a limited profit. I wish I had brought the accounts. I would reckon my capital on it at about 1,750*l.*

15,855. I think you gave us to understand that you had spent a great deal of money upon it, and that any money that was wanted was forthcoming?—Yes, I have spent money in extra skillings; and things of that sort.

15,856. That rather goes to show, I think, that capital was not altogether what was wanted; there must be something behind?—There is one thing; I get the old rent you know.

15,857. (*Chairman.*) Did the 150*l.* a year include the interest on your capital or was it beyond?—It is more than the interest on the capital. I must have had the 600*l.* at the end of three years, and the other has gone in increasing the stock.

Productive power of land.

15,858. (*Mr. Giffen.*) You spoke of investments during the period of 40 years previous to 1870, as well as expenditure in improvements which, in your experience, amounted to one-half of the value of the purchase price, and increased the productive power of the land in many cases to double?—Yes.

15,859. When you speak of the productive power of the land in that sense, do you mean the value of the produce or the quantity?—I am saying that on this particular farm we have raised the keeping power of the land to 87 head of horned cattle as against 30. My man tells me that he thinks now he will be able to add considerably to it; in fact we have bought in within the last fortnight seven other beasts.

15,860. What you had in view then was the quantity of the produce more than the value of the produce?—As the stock increases, and the manure and other things increase, so I think the capacity of the land increases.

15,861. I wish to ask you as to the increase of the productive power taken in the value of the produce notwithstanding the fall of prices, how much would that come to?—Would what our milk came to last year give it to you?

15,862. That would help if you compare it with the previous year?—Our milk bill, I think, last year

Sir. G. Goldney. 12 Apr. 1894.

came to about 1,130*l.*, and then we had a quantity of oats, and we sold off a quantity of hay. I should think that the product must have been somewhere about 1,650*l.*, or 1,700*l.*, or something like that—say 1,600*l.*

15,863. How would that compare with any previous period taking the total value?—Speaking generally over the 11 years it is somewhere about the same. I do not think that the lessened prices have affected us so much, because the price of milk went up last year rather.

15,864. Then I notice that you are speaking mainly of a dairy farm, a milk farm?—Yes; as regards the other farm the prices went down last year there is no doubt.

15,865. So that another farm, where the produce is not milk, would not stand quite so well?—We have now turned that into a milk farm and laid down a great part of it to grass.

Want of capital.

15,866. Would you say that the chief reason for people not buying land, or putting capital into land of late years has been the trouble and the difficulty, and the denunciation of landlords?—I think a great deal of it is due to that; the fact is no one will look at it.

15,867. You will admit, I suppose, to some extent that the badness of the investment has operated on their minds as well?—I do not think so much of that. I think there is a natural inclination for men to acquire land; the surroundings and the pleasures of the thing go a great way when a man really does not want to have it as an income.

15,868. So that it is the case that the way the landlord has been sat upon is the reason why money has not been going into the land?—That is what very large professional men tell me, and what monetary men tell me, they say, "I don't want it."

15,869. So that your view is quite the opposite of that which has been put before the Commission, that the tenant farmer is the oppressed person?—An owner feels that he is to a certain extent in the hands of outside people, even beyond the tenants. The tenants are tempted to buy, but the landowners say, "We ought to have some influence in laying out this "money that we are to be charged with."

15,870. We have had various grievances stated before this Commission on the part of the tenant farmer to the effect that he is the suffering man in agriculture, but that is not the view that you would take?—Supposing the object is to increase the produce of the country then I am certain it is not. I know one man with a very large experience, and who sees a great deal of the world, who farms 1,200 acres of land in what was the worst part of Surrey, poor, hungry clay. By his infusion of capital he has made the whole 1,200 acres into a garden. If it had not been for this capital imported by him at the present moment that land would not produce more than the street.

15,871. What rate of interest does he get on his capital?—I am not sufficiently acquainted with his books. It is in the neighbourhood of Guildford, and he has set an enormous example to the whole of that district by putting a certain quantity of capital into the land. I do not think that he has looked to the interest so much as to the pleasure of going on and improving the productive power of the estate.

Farm accounts in 1770 and 1894 compared.

15,872. With regard to those figures which you gave with reference to the period about 1770, can you explain why it is that the rents now are only about the same although the value of the produce is so much greater? I think you referred to the wages would that account for it?—The price of produce was very much less; it was 27*s.* a hundredweight for cheese, 15*s.* for wheat and so forth. 36 lbs. of beef were sold at 2½*d.* and so on.

15,873. The point is that the rents are the same now as they were then?—Practically, within a few shillings, rents at that time were about the same. In some parts they were higher.

15,874. If people do pay the same rents now there must be some other outgoing to take away the extra money which they obtain for the produce?—As near as possible the rents of two or three of the farms that I have here are just about the same per acre.

15,875. Then what is the extra outlay which the people have to pay now, is it more wages that they have to pay?—Yes, they have got to pay more wages and they have to pay a very much larger price for stocking their farm, because at the time I am speaking of a cow was only worth about 5*l.*

Sir. G. Goldney. 12 Apr. 1894.

15,876. Do the tenant farmers themselves live any better?—They live very much better.

15,877. That makes some difference?—Certainly a difference.

15,878. The tenant farmer himself is a more expensive man to produce?—Yes.

15,879. In comparing these prices have you taken into account the possibility that the quality of the article so long a time ago was not quite the same as its quality now?—I do not think that bears upon it. What I am saying is that money was more valuable no doubt, but that they paid in that, to them, more valuable money the same rents practically that they do now, and that the sums which they received for cattle and other things were only about half.

15,880. Are you quite sure that money was more valuable then?—I think it was in this respect, that they bought the commodity at a low price.

15,881. I am asking if the commodity was quite the same?—I suppose wheat to a certain extent was.

15,882. I am speaking especially of cattle?—They were not perhaps so good, but they must have produced food. They required to have a hardier cattle. When I just entered upon life, when this capital I am speaking of was imported into our district, I do not suppose that there was one farm in three or four or five I may say which had any skillings at all for their cattle. They had great hedgerows in the winter and wattled places for them to feed in, and that necessitated their having a hardier breed of cattle than we have been able to have in the present day, not so productive, not so easily fattened, not so good for milking purposes, but still necessarily hardened to endure the cold winter.

Freedom of sale.

15,883. (*Mr. Gilmour.*) You put a good deal of stress, I think, upon being able to turn into money some of your produce?—Yes.

15,884. I want to know whether the tenants round about you have the same freedom of sale?—Freedom of sale, of course, for all animals.

15,885. I refer to their crops. Have they the same freedom of selling hay and straw, for instance?—The general understanding is that if they sell their hay or straw they must bring back an equivalent of manure of some sort for it. But there is no restriction; generally they may sell it. The covenant in the agreement is that they are either to consume it, or to bring back an equivalent. One of my tenants only within the last fortnight said: "I think I can do a good turn by selling "a lot of hay. I have about 30 tons, I think, that I "can sell off if you have no objection. I thought I "would mention it to you." I said: "I have no objection." He said: "I will bring some manure in."

15,886. I understand then, that they have to come and ask the proprietor's leave before they can do so?—Yes, that is supposing it is in the agreement. As I say, we want freedom of contract, and the right for men to contract, because a man, when he enters on his farm, can make his choice and say: "I should like to sell everything," or otherwise.

Dairying.

15,887. Are the farms round about chiefly dairy farms?—Mainly, I should think three-fourths of them are; they are mixed farms.

15,888. Have you a good market for your milk?—We have a large factory in the immediate town which takes the milk of about 2,000 to 2,500 cows; then other farms send it up to London. What they complain of is that the railway rate is a little too large, and that our English railways do not do the same as the American railways do—that is, suit their rates to the value of the produce that goes up.

15,889. What average price are you getting for this milk per gallon?—We are getting from the milk factory at the present moment I think it is 5¼*d.* per imperial gallon for the six summer months, then 8*d.*, I think, or 7*d.* for the months beginning with September, and then 11*d.* for the two winter months; that is delivered at the factory. We get more in London, but then we have barn gallons, and we have to deduct a little in consequence. One of our farms sends up to London and the other sends to the factory, and perhaps the return is a little more in favour of sending it to London.

15,890. Is the dairy work increasing in your district?—No, we all sell the raw material if we can.

15,891. Is the production of milk increasing?—Yes, very much indeed. I have tried on one of my farms adopting the very best process we could to make Cheddar cheese; we succeeded very well, but after trying it for a couple of years I found I could not make it so profitable, taking the labour into account, as selling the milk. I am satisfied that the quicker you get rid of your raw material—whether it is calves, or pigs, or lambs, or anything of that sort—the better. You must get quit of them; you must turn them into money.

Results of farming on two farms compared.

15,892. (*Mr. Little.*) You have compared two farms in your own occupation, I understand?—Yes.

15,893. One has been successful and the other has been a failure?—Yes, during the last few years.

15,894. A comparative failure then?—During the first three years I had a very good man as bailiff, but he went to some agricultural college near Salisbury. He did very well, and it paid; but then I had a bailiff who was not skilful, and he was tempted into buying these artificial manures, and that broke it down.

15,895. Then you attribute the comparative success or comparative failure to the system of management?—I do.

15,896. Was the success due to depending upon the farm for its own supply?—Yes.

15,897. Are those two farms fairly comparable in character?—I think so; they are not very far apart.

15,898. Now the two bailiffs, I understand, are working in unison together, and they adopt the same plan of selling the things as soon as they can?—Yes.

15,899. One is almost entirely grass, is it not?—Yes.

15,900. 35 acres out of 215?—There might be 25, not more, arable.

15,901. It is grass of good quality, I presume, from the rent having been 45*s.*?—Yes.

15,902. The other farm was two-thirds arable?—The other was, and of course it has not come on so well.

15,903. I presume, therefore, it is of an entirely different character of land?—Yes, it is different land.

15,904. What was the rent of it when it was let?—The rent of this other farm when it was let to the last tenant was 550*l.* a year, and previous to that it used to let for 800*l.*

15,905. At 550*l.* a year, that would be less than 30*s.* an acre?—Yes, somewhere about that.

15,906. As against 45*s.*?—Yes.

15,907. But you think the difference in the results on the two farms is not due to the character of the farms but to the management?—Yes, the other farm, which is of 400 acres, was originally let on lease, and it used to let at about two guineas an acre.

15,908. Do you think the fertility of the farm can be maintained if the milk and the hay are sold?—Not if the hay was sold and nothing was brought on.

15,909. You must have something brought back in place of the hay?—Yes.

15,910. Otherwise the farm would not maintain itself?—Yes, there must be a proper economy in the manures; that is a very essential thing.

Leasehold tenures.

15,911. In the notes of the evidence that you were prepared to give there is a reference to the subject of leasehold tenures which you seem to regret the disappearance of?—I regret it very much indeed. There is a very large tract of land in this country which is held by eleemosynary bodies or by colleges. In my early days a very large portion of this property was leased out for a certain number of years terminable on lives, where the occupier himself without having put his hand into his pocket for the whole amount of capital necessary to buy the land, got a quasi-ownership which induced him to treat it as his own, and to manage it as if it was his in perpetuity. Unfortunately an Act of Parliament was passed some few years back—I do not know at whose instigation—prohibiting those bodies letting their land for more than 20 years; and the consequence is that all these old leases have died out, and the land has got into disrepute. When the men found their leases were running out they farmed the land I presume for quitting.

15,912. You think that the leaseholders were improving occupiers then?—Yes, I am quite satisfied of that; Christ's Hospital and the Sons of Clergy Society held together, I daresay, land that used to amount to 40,000*l.* and 50,000*l.* a year, pretty nearly. Charterhouse and Eton College are also large holders whose land was let out on lives.

15,913. We have had evidence from receivers for estates where leasehold estates have fallen in, and we have been told that the expenditure upon those estates has been enormous in consequence of the bad condition in which they were left?—It is very possible; this Act having been passed, seeing that there could be no renewal, the men took as much as they could out of the land, and that is human nature.

15,914. I am speaking rather of the permanent improvements in the nature of buildings?—I do not know about that; but as far as I know, the holders under colleges did well, and the colleges also.

Want of capital.

15,915. (*Mr. Chaplin.*) I understand the general drift of your evidence is to this effect: that if agriculture is to become prosperous again more capitalists must be induced to purchase land?—To get capital into it; I know of no other mode than that.

15,916. At present you hold that they are deterred by legislation or by the fear of it?—I do, and I hold it not as my individual opinion, but as the opinion of a large number of professional men whom I have talked it over with, and a large number of capitalists whom I have talked it over with, who simply say, "I won't buy trouble."

15,917. If they were encouraged to invest their capital in land again you are of opinion, I think, that agriculture might still be made to pay?—I am.

15,918. When you say that do you mean at the present range of prices?—Yes.

Freedom of contract.

15,919. In order to encourage them to invest their capital, what you desire to see, I understand, is greater freedom of contract between landlords and tenants, is that so?—Quite. So that if the landlord chooses to make an arrangement for advancing an increased capital to the tenant he can do so on certain stipulations as to the mode of cultivation being carried on under his personal supervision.

15,920. Do I understand that you would be opposed to amendment of the Agricultural Holdings Act, or to other legislation, the object of which would be to give greater security to tenants for compensation for improvements made by them?—I think there ought to be entire freedom of contract between man and man. I have no idea that our existing men are so imbecile that they cannot take care of themselves, and that they require a paternal Government to be laying down rules that they shall not do anything that in the opinion of Parliament is unwise, without Parliament having given any justification or explanation of such a course. Why are men more ignorant or incapable of carrying on their business now? What I say is, that the man who has the least scientific knowledge of the two who are in partnership is to be the arbitrator of what he is to do, and what he is to take, and he is to compel the other to pay him. With regard to a large quantity of these manures and feeding stuffs, if I had my view entirely nothing should be paid for them beyond what is the real value of them. But the tenants are tempted, as I say, by circulars—every moment I get them. A new bailiff comes there, and he is flooded with them; for seeds, for cake, or this class of manure and the other class of manure. My bailiff that I have talked of, who is a sensible man, says: "I cannot understand where "I am to put the money directly I part with a sove- "reign. If I go and part with 70*l.* for these things, "where can I put it; how am I to get it back again? "I know what a sovereign will bring me if I go to "market with it, but if I put it into this stuff I do not "know where it is to go; what return I am to get for "it, where I am to class it." I am quite satisfied that a farm properly managed and skilfully managed, I do not say that there are not some exceptions, can be made to pay itself, you can sell one part of the produce and watch the markets and buy Russian barley, say, when a chance occurs, or anything of that sort. I must mention a very remarkable statement of a very intelligent and large farmer friend of mine, who is also a cattle dealer. I met him at Swindon the other day, and he said: "I do not know what we farmers would have done if it had not been for the Russian barley."

Sir G. Goldney.

12 Apr. 1894.

Want of capital.

15,921. (*Mr. Everett.*) I see you state that it is your opinion that even in these days farming may be made to pay a large return on the capital employed by the tenant?—Yes, a fair return.

15,922. Is it not the fact that farming is a very pleasant occupation?—I dare say.

15,923. One which is a popular occupation?—If it is contrasted with other business; I do not know that it is so popular just at present.

15,924. Perhaps you will understand best what I mean if I connect my questions. I was going to ask you if it is not the fact that farming is a pleasant and popular occupation; is it not also the fact that in this country there is any quantity of capital ready to flow into any business that will pay, and is not the very fact that a great many farms go begging, and that you cannot get a tenant at any price at all for many of them, a proof that in the opinion of those best acquainted with the business there is not a profit to be made?—I do not know that.

Farm accounts in 1770 and 1894 compared.

15,925. They could have the money to put into it if they could be shown how to make a profit?—I have put these statistics in in order to show that there was a time at all events when prices as regards cattle were about half what they are now and rents were the same. I suppose it did pay, because during a period of 35 years the rents were always paid.

15,926. You also assured us that at that time the wages—which are a very great item—were less than half what they are now?—Yes, but there is a great deal to come in mitigation of that. There is the increased value of machinery. I look at all these things. Take the very question of haymaking. I take it that the elevator saves two men to begin with; in the same way with a small steam engine you are able to do a lot of work in threshing and things of that sort, which was done entirely by manual labour then. You cannot compare without looking at the question of machinery, the low rate of wages then with the wages that are paid now. I do not think it is so large an element as some people think, but that is one question that does to a certain extent come in—Saturday nights always come round, and the men are always ready to have their money.

Sir G. Goldney.

12 Apr. 1894.

Farming to a profit.

15,927. What strikes me is that the evidence you have given or the opinion you have expressed in regard to the possible ample profits of farming even now is contrary to the whole weight of testimony which has been laid before us?—Possibly.

15,928. And contrary to existing facts in many of the counties of England, where land is actually going out of cultivation because people will not farm for nothing?—There is a very large difference in land. In an uphill farm, where there is a very large quantity of poor arable land, there the expense of labour would militate against it, but that is to be met in some way or other and counteracted. I am speaking of course very much of my own immediate district, where the land is all fair and good. There are parts of Hampshire with very poor soil. I do not know what was done in those days, perhaps it was left a sheep run, and it may not be letting at the present moment—it never did—at more than about 5*s.* an acre. There is no doubt but that this question of tithes is a great burden on some of the farms, but that has more or less got on to the landlord.

Tithe.

15,929. The tithe was paid in kind mostly a century ago or a century and a half ago, was it not?—Yes, partly so, but in many cases, in money compositions. There is, however, another question also, payments in kind, if one might venture to mention it. You say paid in kind. I have had it put over and over again to me by the men themselves, why should not they take a certain produce of the farm in the shape of milk and things of that sort instead of having to go to the shops and deal for it? I think the Commission ought to consider the stipulations with regard to the Truck Act. In a great number of cases men might have a certain quantity of milk and other produce given out to them in lieu of the equivalent in money. Now the milk goes into the factory, and then it has to come back, and they are paying quite double the price at which the farmer sells the milk wholesale.

The witness withdrew.

Mr. C. S. Read.

Mr. Clare Sewell Read called and examined.

Mr. C. S. Read.

15,930. (*Chairman.*) You farm, I think, 750 acres in Norfolk?—I do.

15,931. As a tenant farmer, or is part of it your own land?—That is as a tenant farmer.

15,932. And you represent here the Farmer's Club and the Norfolk Chamber of Agriculture?—I do. I wish just to qualify that statement about representing them both, because upon one point these agricultural associations are opposed to each other, and only one point that I know of, that is with regard to the importation of Canadian healthy store cattle. The Norfolk Chamber of Agriculture is much in favour of it, and the Farmer's Club is dead against it.

15,933. Which way do you incline yourself?—I incline to my own county.

15,934. With the exception of that point you represent both of these associations?—I believe I do; and they coincide with each other, I believe, mainly.

15,935. Your evidence will be mainly relative to the eastern parts of England, and especially Norfolk, I believe?—Just so. Might I refer to my own farm, please?

Description of farms.

15,936. Yes?—I would say that five years ago I gave up three small farms which were almost contiguous to my own, and I hoped I should have been content with my home farm of 400 acres for the rest of my life. But this last Michaelmas I had to take a farm of 320 acres. My brother is the rector of a small parish in which this farm is situated, and he used to let this farm of 320 acres at 24*s.* an acre, but it had been reduced to about 200*l.* a year. Last year the tenant failed. My brother advertised the farm, and the only *bonâ fide* bid that he got from a solvent tenant was 2*s.* 6*d.* an acre, and consequently I had to take those 320 acres into my occupation.

15,937. Out of brotherly love, I suppose?—Certainly with no idea of profit.

15,938. Do you agree to pay rent for it?—Yes, I have agreed to pay 100*l.* for the first year and then 150*l.* a year afterwards.

15,939. (*Mr. Chaplin.*) His only offer was, how much?—Half-a-crown an acre. It is in a very bad state of cultivation. I need not say that, but it is fair light arable land.

15,940. (*Chairman.*) You have agreed to give 100*l.* for the first year and 150*l.* a year afterwards you say?—Yes.

15,941. Is it glebe land?—Yes. It is one of the few cases in Norfolk where the parson's income is derived entirely from land and not from tithe. There is no tithe in the parish.

15,942. In respect of the other farm which you have in your occupation, has the rent of that been considerably reduced?—It was not advanced for 50 years.

15,943. What is the rent now?—We have had a reduction of about 20 per cent. in two different reductions, and the rent and tithe are now about 26*s.* an acre. That is a very nice arable farm, nine-tenths of which are under the plough.

15,944. (*Viscount Cobham.*) Does that include the shooting?—No, it does not include the shooting.

15,945. (*Chairman.*) I understood you to say that for a great number of years the rent had remained the same?—For 50 years.

15,946. Therefore it was rather low rented, I suppose, a few years ago?—It was very low rented some 30 years ago no doubt.

Farm rents.

15,947. And therefore the rent has not been reduced in the same proportion as other farms?—Certainly not. Then I might say with regard to the rent of an arable farm, although it is an old saying that you ought to make three rents, if you do not make six or seven I am quite sure you cannot live.

15,948. (*Mr. Chaplin.*) Six or seven?—If you cannot make six rents off your arable farm there is no farmer in England can live.

15,949. (*Chairman.*) At the present time?—Yes.

15,950. Formerly the proverb was that there must be three rents made out of the land?—Yes.

Mr. C. S. Read.
12 Apr. 1894.

15,951. Now in consequence of the reduction of rent, you would say the farmer must make six?—I would not say in consequence of the reduction of the rent; I say in consequence of the increased expenses that we have in these days of high farming.

Agricultural depression. Bad seasons.

15,952. Now with regard to the agricultural depression in your district, will you state what your experience has been as to its length and extent?—First of all I will take the seasons. We have not had an all-round good crop of farm produce since the year 1874. Corn and roots and hay in that year were good, and they have not been all-round good since that period. Then in 1879 we had a very disastrous year, which I think was common to the whole of England. Then in the years 1891 and 1892, we had two cold miserably wet seasons, and in 1893 we had the great and terrible drought which I think extended over the chief part of the east, the middle, and the south of England. That year I would say was exceptional in this way, that whereas in all other hot dry years we have had a great crop of wheat, in 1893 we had a small crop of wheat, and whereas in those dry hot years generally speaking we have had a very fine quality of barley; in that year we had a very inferior quality of barley, about one third of the crop of hay and taking the county throughout I suppose not half a crop of roots.

15,953. As a general rule the hot season is advantageous to the east of England I suppose?—But for a light land country we must have the wet too.

15,954. (*Viscount Cobham.*) Are you not more afraid of a drought in Norfolk than a wet season?—Yes, very much more so. We can stand any amount of rain if there is a fair amount of heat.

The depression in Norfolk.

15,955. (*Chairman.*) You have had three exceptionally bad years consequent on bad seasons?—Yes.

15,956. Two very wet seasons with low temperature followed by one of exceptional drought?—Yes. Now I may say that the condition of the farmers of Norfolk is verging on absolute ruin and wholesale bankruptcy. We are very very poor. Now I wish to make one exception to that if you will allow me. There is a district in Norfolk that we call the Land of Goshen; it is in the north-east corner of the county; it is deep friable arable land that has been farmed well for 200 years. The rents in that locality have not fallen in the same way that they have in other parts of Norfolk and last year they were exceptionally blessed by having a good crop of corn and a fair crop of roots. They had sea fogs in the spring which kept them going and they had thunder storms almost all through the summer, so that that portion of the county which lies north-east of Norwich has been fairly dealt with by Providence during that great drought.

15,957. (*Mr. Chaplin.*) May I ask again for your two expressions. I think you said "wholesale ruin" ——?—I say absolute ruin and wholesale bankruptcy and I really mean what I say.

15,958. (*Chairman.*) Then in this district to the north-east of Norwich that you speak of have the farmers weathered the difficulties?—Yes, I think they have fairly well. They have had the advantage of not only growing a large crop, a much larger crop of grain than we have, but their barleys have been of a better quality than the rest of Norfolk.

15,959. Then comparing their condition with that of the farmers of the other parts of Norfolk one would conclude that the main difficulty has been one of seasons?—Yes, and there is also this to be considered, the nature of the soil. It is good deep arable land which has been farmed well, and it will stand wet and stand drought and almost every year bring you a good crop.

15,960. But, still, they had the advantage of some degree of wet last year?—Yes.

15,961. Whereas the rest of Norfolk did not?—It did not.

15,962. Therefore, one would conclude that it has been the bad seasons which has mainly operated against the other parts of Norfolk?—The bad seasons, and, of course, the low prices in inferior districts where they grow an inferior quality of corn.

15,963. Then in the district that you speak of in the better land, they get a superior quality of barley and wheat which fetched a higher price in the market?—Yes, barley particularly.

15,964. What has been the effect upon the various classes of the agricultural community of this depression; take the landlords, in the first instance?—Might I just say my own losses?

Mr. C. S. Read.
12 Apr. 1894.

Income tax. Schedule B.

15,965. Yes?—I think during the last eight years that I have appealed successfully on five occasions against Schedule B., and have got the amount of that tax returned. I have no fault to find at all with the way in which farmers are now allowed to appeal under Schedule B; that is to say, they can take a statement of their cash account for the year, and with a declaration that the stock and crop remain about the same upon the farm, without a valuation, which, I consider, is a great boon. Of course, in the first place, farmers cannot make a valuation themselves, and if they did it would be most misleading.

15,966. They are not obliged to make a valuation of their stock?—They are not.

15,967. They merely make a declaration that their stock remains about the same at the end of the year as at the beginning?—Yes.

15,968. And then the income tax is assessed upon the bare outgoings and incomings?—Yes.

15,969. (*Viscount Cobham.*) If the stock has varied much would it not have to be valued?—They have to say if the number is less or more. With regard to the price or the value of that stock, they are not required to make a valuation.

15,970. (*Chairman.*) Are we to understand that you have appealed against Schedule B. in eight successive years?—No, out of five years. The reason that I have not appealed in the other years is, perhaps, rather a ridiculous one, but it is just this: when you give up a farm as I did five years ago—I gave up three farms, and had worked them all together—it is extremely difficult to know where to apply all your outgoing crops and stock that you sell. It is the same now in the present year when I am taking this farm; I know I shall lose money, but I have already paid Schedule B. and it is impossible for me to appeal against it, although I know I shall have a great deal to spend, and I am equally certain that I shall have nothing coming in.

15,971. Apart from the difficulty you have been speaking of in the way of taking on a new farm, or in giving up an old one, you have not found a difficulty in dealing with the question of an appeal against the assessment?—No, none at all.

15,972. You have appealed in how many cases?—I think five years out of eight I have appealed.

15,973. On the ground that you made no profit equal to Schedule B.?—Yes. I may say that if farmers would keep accounts they could almost all of them appeal—I am quite sure of that, and would appeal—but they seldom keep accounts, and therefore cannot appeal. The majority of farmers do not keep accounts beyond their banking book.

15,974. Would you say the majority of farmers in your district pay the income tax, although they make no profits?—Yes.

15,975. Or make less than the profits indicated by the Schedule?—In the last three years I am certain that they have paid a great deal of property tax which they might, if they had kept better accounts, have been refunded.

15,976. But you make no complaint of the process under which the claim is made?—Not at all.

15,977. Therefore it has been the fault of the tenant farmers for not keeping accounts?—Entirely.

Results of farming.

15,978. Then taking the average of the eight years how have you done?—I have lost a lot of money. I do not like to say how much, in fact, I do not know, and I say nobody does know until either they are dead or they are bankrupt or something of that sort. We keep going from year to year, and it is very difficult to know exactly what we have lost or what we have gained, but I have lost money on the average for the last, I think I may say, 20 years—certainly I have made no money. I have not made 10 per cent. one year since the year 1874.

Reduction of rents.

15,979. Then as regards the landlords of your district, what has been the effect?—The larger landowners have reduced their rents; some of them, I am sorry to say, hardly reduced the rents in time. I got into a terrible row some years ago when I was a member of Parliament, because at an agricultural dinner I advised the landlords to make those concessions to the

Mr. C. S. Read.
12 Apr 1894.

old tenants that they were forced to make to the new ones; but some of them did not take my kindly hint, and on those estates there has been a considerable change of tenancy; but upon the others I am happy to say that timely reductions have kept the tenantry there. We have singularly few changes now, and that, I apprehend, results from this—that landlords are willing to take any rent, and to keep any tenant there they possibly can; and what with the landlords and the bankers the tenants hang on somehow.

15,980. What has been the average reduction of rents in your district, would you say?—I think the average reduction of rents, taking it all round, is something like 33 per cent. In the district which I have referred to, the north-east part of Norfolk, I do not think the reduction has amounted to above 15 per cent., possibly only 10; then on the very light and the very heavy lands there have been reductions from 50 to 75 per cent., so that I think I may strike an average and say that rents have been reduced within the last 14 or 15—well, 20 years we will say—fully 33 per cent.

15,981. Now taking the district of North-East Norfolk, where you say the reduction has been 15 per cent., what is now about the average on the land in that part; is it above 1*l.* an acre?—Yes, I should think rent and tithe there would amount to a good 30*s.*

15,982. Still 30*s.*?—Yes, still.

15,983. Take the next district, the better land in the other parts of Norfolk, not the very light or the very heavy, but where an average reduction has been made of 33 per cent., what should you say is the rental there?—From 15*s.* to 20*s.*

15,984. And in the worst district, the very light and the very heavy?—2*s.* 6*d.* to 5*s.* an acre.

15,985. What proportion is there of land of that kind?—We have not much heavy land in Norfolk. A little of it abuts on Suffolk, but there is a very large amount of ordinary land in Norfolk, some of it light chalk, some of it thin gravel, and there is a good deal of very ordinary fen land.

15,986. What proportion of the land should you say was reduced to 2*s.* 6*d.* or 5*s.* an acre?—Certainly not one-fourth.

15,987. When were these reductions made generally?—They have been going on for the last 15 years I should think. They, of course, were more general on those farms where the rents have been raised, and now I think we have got, generally speaking, a permanent reduction of rent, although in these last two years, in consequence of the bad seasons, there has been a further rebate of 10 per cent.

15,988. But that has not taken the form of a permanent reduction?—No, it has not at present, but it must do.

15,989. It may?—I think it must.

15,990. (*Mr. Chaplin.*) Is that included in the reductions you have given us, or is that in addition—I mean taking your average reductions; were those further rebates taken into account?—No.

15,991. These rebates are in addition?—Yes, they are in addition; you see they are so very partial.

15,992. (*Chairman.*) And they are due to the very bad seasons of the last three years?—Yes, and to the drop in prices.

15,993. I presume that some portions of those reductions followed upon the bad year of 1879?—They did; they began then, certainly.

15,994. And then later there was a further reduction?—There was a further reduction.

Rates.

15,995. Then I presume that the tenants have had the benefit of their reduction of rent in the reduced assessments for their rates?—They have; where there have been permanent reductions they are generally allowed.

15,996. Should you say generally that they have had the benefit of that reduced assessment?—Some unions take actual rent and others do not, and in some of those unions I do not think that they have allowed the reduction. I know an instance where there is just a nominal rent—they never go down to that. In my own instance where I said that I was going to give 100*l.* a year for these 320 acres they would not reduce the assessment below 180*l.*, for there they do not take actual rents. I am chairman of the assessment committee in my union, and we always do take actual rents.

15,997. But in the case of this farm you have just taken in hand, I think you said that for a year the rent was to be 100*l.*?—Yes.

Mr. C. S. Read.
12 Apr. 1894.

15,998. And for the next year 150*l.*?—Yes.

15,999. I suppose in that case they would put the assessment at 150*l.*, not at 180*l.*?—They have put it at 180*l.*; that is what they have put it at; I do not know whether they are going to alter it.

Tithe.

16,000. In regard to the tithe, what has happened?—The tithe is down 25 per cent., but it is a great burthen upon the land when the net income of the owner I am quite sure has been reduced 50 per cent., because in addition to what he has actually lost in the shape of rent, tenants now-a-days require so many more good buildings, and they also insist upon the repairs as a rule being done by the landlord, and of course all the outgoings that he has hitherto had to pay have fallen upon about half his income, and they feel the burthen of the tithe.

16,001. In regard to the tithe, has the landlord taken upon himself the tithe?—Yes, I think, generally speaking, now he has.

16,002. And he has not raised the rent in proportion to the tithe which he has paid?—I think that on the majority of estates, long before the passing of the last Tithe Act, the landlords in Norfolk had paid the tithe. I might say that in the county of Norfolk we pay more tithe than the whole of the 12 counties in Wales. Whereas this reduction of 25 per cent. is chiefly caused in consequence of the reduced price of wheat that we grow, the Welsh farmer does not grow any wheat, but he gets the benefit of the reduction.

16,003. The East of England generally has paid high in the shape of tithe, I think?—Yes, all the corn districts in England have paid a heavier tithe.

Corn returns.

16,004. Then you say that the landlords have had to make a much greater outlay in consequence of the demands of the tenants, and have taken upon themselves repairs to a larger extent than previously?—They have. Might I make an observation upon the corn returns. I think that the case of the tail corn, which has been mentioned, I believe, by some witnesses here, is now fully met by the weight which is appropriated to the different cereals. Wheat is taken at 60 lbs. to the bushel, and that allows for the tail corn in my opinion which they said was previously sold separately.

16,005. You do not think there is much grievance, then, on that point?—I do not think there is any grievance in that, but there is a grievance which might be easily remedied, and that is the repeated sales of the same bulk of corn. It is as easy as possible just to say: "You must not return any corn except it is bought direct from the grower." If you did that there would be an end to that altogether. But now sometimes, barleys for instance, are sold three or four times over, and being the best qualities that are sold in this way, of course there is a considerable amount of increased price there, which is not legitimate.

Sub-division of farms.

16,006. Has there been any change in the size of the farms in your district?—No. I do not believe there has been any change except in this way that when a landlord has got a farm into his own occupation he generally tries, if he can, to cut out a small holding from it.

16,007. And in that respect there has been some increase of smaller farms?—There has been some increase, yes; but it is very difficult to say how much.

Land laid down to grass.

16,008. Has there been much change in the cultivation of the farms—much land laid down in grass?—There is some land that has been laid down in grass that was broken up from sheep walk and rabbit warren. That has gone down to grass as long as it will continue in grass; but, unfortunately, the soil is so light, and the climate so dry that the grass seems as if it would not exist above a certain period, and it has to be ploughed up, cropped, and laid to grass again. Might I make one observation about yeomen?

Yeomen in Norfolk.

16,009. Yes?—We have had a good many yeomen in the county of Norfolk, and I say that they are much the hardest hit of all. They have got to bear both the losses of the landlord and the losses of the tenant, and there have been the most disastrous failures. A good many of our farmers some 25 years ago were told that the best thing that they could do was to buy their farms, and they did so. But they had not enough cash, and they had to mortgage their farms. They have gone to the wall worse by far than the common tenant farmers. There are a good many of our old

and most respected yeomen who have disappeared within the last few years. I feel confident that they will almost all of them go unless there is a change for the better, provided of course that they have not got other means or anything of that sort. With respect to the yeoman who farms his own estate we always used to say that "a man who farms his own estate had a fool for his tenant"; and he is a bigger fool than ever in these days because there is no profit whatever to be made from it.

16,010. Where the land has been sold what has happened; has it been bought by other persons who farmed the land themselves, or has it been bought by an adjoining landowner?—It has chiefly been bought now-a-days by people who have been successful in trade, butchers, dealers, men who have made money perhaps by breeding horses—generally speaking it is some man in the district with a certain amount of capital, and he has been a trader.

16,011. And they farm it themselves?—They farm it themselves.

16,012. Then it has gone from one yeoman to another, so to speak?—It has, if you call them yeomen, but they continue still to practise their trade, and I daresay they may get on. As a rule they farm it pretty well too, if they are butchers.

16,013. They have brought in capital?—Yes.

16,014. And they have got their land cheap?—Yes, and they have got the advantage of having a trade at the back of them, which almost all small farmers ought to have.

Wages.

16,015. Now as regards the labourers what has happened?—The labourers' wages, I think, have been reduced about 15 per cent. from the highest point they were some years ago. We are told that we are paying 10*s.* or 11*s.* a week wages, but I believe that every able-bodied labourer in constant employ who receives those wages really gets from 14*s.* to 15*s.* a week in the course of the year taking it all, harvest wages, task work, and extra work.

16,016. Is that after the reduction at the present time; you say they are now getting 14*s.* or 15*s.*?—Yes; we used to pay about 12*s.* or 13*s.* per week.

16,017. (*Mr. Chaplin.*) What do they get now?—10*s.* and 11*s.* and 12*s.*, according to what they are. There are a considerable number of men out of work this winter, mostly young fellows. No really good agricultural labourer, I believe, has been out of employ, not in my district, but there are, in some of the heavy lands, a very great number of men who have only partial employment, I believe.

Juvenile labour. Women's labour.

16,018. (*Chairman.*) Is there much juvenile labour employed?—No, we have a difficulty in getting boys; they are kept at school so long now-a-days that they do not care for farm work very much, and unless a boy begins to know something about a horse by the time that he is 11 or 12 years old, he never takes to them very kindly. We have a great difficulty; we often have to set men to do boys' work. The women's labour is almost entirely extinct with us. We hardly get any women to come into the fields; not only that, but they do not even care about gleaning now-a-days, they do not come out to glean. Last year we had a most enormous crop of acorns, which could be sold at a shilling a bushel, and they were not all picked up. Then we have flints on our lands which are extremely useful for the purposes of road-making, and we cannot get them gathered. Then, generally speaking, I might say that you do not see a woman outside her cottage at all now-a-days.

16,019. Has there been a great change in that respect?—Yes, a great change, and it is a good change in a great number of ways.

Condition of labourers.

16,020. Do you think it is a symptom that the labourers are better off as a whole?—I think it must be.

16,021. It must be?—Yes, it must be, they are very much better off.

16,022. Then I presume that although the wages have been reduced in amount, yet, considering the low price of wheat and other food, they are, perhaps, better off than they were?—They are very much better off now than they were 30 years ago, where they can get employment. The only thing is how long they are going to be employed—that seems to be the difficulty.

16,023. Without going back to 30 years ago, comparing them with 10 or 15 years ago, what would you say?—The cheapness of produce has been greater than the reduction in their wages, no doubt.

Mr. C. S. Read. 12 Apr. 1894.

16,024. They are better off then in that respect?—Yes, but the cost of the labour to the farmer, you know, is more than ever, although these wages have been reduced.

16,025. (*Viscount Cobham.*) But you say the women are earning little or nothing?—The women do not do anything in the land and they do not brew at home, which they might do, and they do not bake at home.

16,026. (*Mr. Little.*) Do they work on the allotments?—I seldom see a woman doing anything on the allotments.

Cost of labour.

16,027. (*Viscount Cobham.*) You think, notwithstanding the loss of the women's earnings, that the labourers are better off?—They must be better off or they could not dress or look as well as they do. But with regard to the farmer, I say that the cost of the labour is more than it was. You get worse work, and you get less work and less hours. We have had no strikes lately, but I have no hesitation in saying that if a general strike was to be ordered by the Labourers' Union I believe my men—although I am sure any of them would rise at midnight to serve me—would strike even if it ruined me, and I could not depend upon half-a-dozen of the men. Might I give you my bill of labour for the last four years on a farm of 400 acres? In the year 1890 it was 819*l.*; 1891, 855*l.*; 1892, 840*l.*; 1893, 797*l.*; that is an average of more than 2*l.* an acre, and that does not include the wages of the groom or of the dairy maid, which I think ought to go in.

16,028. (*Mr. Little.*) The reduction in the last year would be in consequence of the short root crop, I suppose, and no weeds growing?—Yes; and the small bulk of hay and corn to harvest as well.

Wages.

16,029. (*Captain Owen Thomas.*) What is the average wages you pay; what do you pay your labourers?—I have been saying that the average wage would be about 14*s.* a week through the year.

16,030. (*Chairman.*) When you take everything into account with harvest and piece-work?—Yes; and supposing that the man is well, you must think of that.

Uncultivated land.

16,031. Has much land that was brought into cultivation in the last 50 years gone back to its original state?—Yes; almost the whole of the land that has been improved during my lifetime has almost all of it now gone back into its original condition.

16,032. (*Mr. Chaplin.*) Throughout the county is it?—Throughout the county. Take the light lands which have been broken up from sheep walk or rabbit warren, they are not worth so much as they were then in consequence of having been broken up and the inability of keeping them down in grass. Then there is the very heavy land which has been well drained, well tilled, and steam cultivated, that has gone back pretty well into what it was before. Then with regard to the fens, almost the whole of the light ordinary fens that I know of in Norfolk which were drained some 40 or 50 years ago have now relapsed into their former condition. I think the Duchy of Lancaster has a large estate in the south-west of Norfolk, a great portion of which is fen land. I can remember that being broken up and for years being capitally cultivated; good houses were built upon it, excellent farmsteads; now if you go there you will find that the whole of the land, I believe, is in the hands of the Duchy; there is a bailiff here and there, and a few fields are cultivated just round the house, and the other has lapsed into its original state.

16,033. (*Chairman.*) I think you said that the land which was let at from half-a-crown to 5*s.* an acre formed about one-fourth of the area of the parts of Norfolk other than the north-east?—I should think that is about it.

16,034. Has all that land gone back into its natural state, or some of it not?—Now and then you will find some of it still under cultivation; as I say with regard to this very light land that was broken up it cannot go back into the original state because we find it so difficult to get it there. If we could put it into sheep-walk again we should be exceedingly glad.

16,035. (*Mr. Chaplin.*) This land that you describe as having gone back is light, heavy, and fen land; I think we ought to have the amount of the three. This land that you spoke of as having been improved was in three different classes, and it has all gone back to its original state?—Yes, most of it certainly.

Mr. C. S. Read. 12 Apr. 1894.

16,036. Can you give us any idea what proportion it is of the county of Norfolk?—I should say it is not a fourth.

16,037. Altogether?—No, not altogether.

16,038. (*Chairman*). Not a fourth?—Not a fourth. Of course, there is some of it that is still under the plough.

16,039. Is that the land in respect of which rent is still paid from 2*s.* 6*d.* to 5*s.* an acre?—There is a good deal of that land which is unfortunately in the hands of the owners a good deal of the light land. There is a very large quantity of it in my district, in fact, I could go seven miles after I leave my parish in one direction where there is not a single tenant farmer.

16,040. What do the owners do with it?—It is worth more for game than it is for anything else.

16,041. (*Viscount Cobham.*) Which is your district—how would you describe your district?—Mine is the centre of Norfolk.

16,042. Near Norwich?—Yes, on some estates they have laid the land down, or rather the land has what we call "tumbled down," to grass in those districts, and it is becoming gradually overrun with heather and little coarse grass, and a few of the best fields round the homesteads are cultivated.

16,043. (*Mr. Chaplin.*) Is there something approaching a fourth of the land in Norfolk which has practically gone out of cultivation?—I should not say that it has all gone out of cultivation, but it has all gone back pretty well to what it was 50 years ago.

Deterioration in farming.

16,044. (*Chairman.*) You have told us that a good deal of the land has gone back into its original condition. In regard to the other land, is it farmed as well as it was?—No, it is not; and that, I think, results very much more from the poverty of the tenants, than it does from any bad land laws that we are supposed to labour under.

16,045. The tenants have not got the capital they had to maintain their farms in a good condition?—They have not.

16,046. When did that begin, should you think?—I should think that began about the year 1879, and it has been going on ever since. Now and then we have had a fair season and a fair crop, and now and then winter grazing has paid pretty well; but taking it from that time, there has been a gradual decadence of Norfolk agriculture.

16,047. The year 1879 was an extremely bad one for the farmers, and caused a great loss of farming capital, did it not?—It was a very disastrous year indeed.

16,048. I think two or three years previously were bad also, were they not?—Yes.

16,049. That was the culminating point, and from that time many of the farmers have had insufficient capital?—They have had no means of recouping their lost capital, and we have no fresh capital brought in either by landlord or by tenant.

Large farmers in Norfolk.

16,050. When farms are vacant, is it possible to find tenants in your district?—Good lands with a certain amount of grass are still readily hired by men of means, and we have about half a dozen farmers of considerable capital and a very large amount of business talent, who have hired vast tracts of land I may say, and farmed them well.

16,051. One would like to know something about these cases. What is their condition?—I asked one man why he took a farm one Michaelmas; he had already six; he said this:—"If there were seven "farmers on these seven farms, they would all want to "make a living, and I think it is a hard thing if I "cannot make one living off the seven." In addition to that, he hoped that something would turn up.

16,052. You said that there were half a dozen cases of men with large capital, who had taken large tracts of land?—When I say large tracts of land, I mean that they farm perhaps from 2,000 to 3,000 acres of land.

16,053. Consisting of a considerable number of farms which have been aggregated together?—Yes, from four to seven or eight farms—that sort of thing; but then they are exceptional men. They are men of undoubted means; they have credit; they have capital; they have business skill; they have untiring energy; and they have the ability of being served by good men as bailiffs: they seem to select the proper men to superintend their farms.

16,054. They generally work their farms, then, by bailiffs?—Yes.

16,055. Do their farms generally lie together, or are they spread about?—They lie in the same district, but they do not actually join or lie together.

16,056. Do these men make it pay?—They have made it pay until the last three years.

16,057. Until the last three years?—Yes; and they now confess that they have lost a good bit of money.

16,058. Taking average years, do you consider that they would be able to make it pay?—I think they have not lost money.

16,059. They have gone on adding to their holdings?—They have gone on adding to their holdings in a good many instances.

16,060. That would seem to indicate that they are making it pay?—They get fully stocked in one way and they do not like, perhaps, to sell the stock. They can get land very much cheaper; every year almost the rents come down, and they hire land at much lower rents than have been known for generations.

16,061. But at the rents which they are giving they can make it pay. Not for the last three years I think you said, but then the last three years, you also said, were exceptionally bad?—They were not exceptionally bad for Norfolk, because we can stand those cold wet years better than some districts of England. Last year was the most disastrous year that Norfolk agriculture has ever known, at least, that I have ever known.

16,062. You would not expect any farmer, not even the best in the country, to make a profit last year, I suppose, in your district?—No; with the exception of that corner of Norfolk which I have mentioned.

16,063. I mean, taking the average of Norfolk and excluding the north-eastern part, I presume no farmer, however good he might have been, could have made it pay last year?—No.

16,064. (*Mr. Chaplin.*) Even assuming that it ceased to pay in the case of these very large farmers I suppose it would not be a very easy matter for them to get out of the business?—It would be a very disastrous thing for them, because if they were to go and sell their stock and their crop at present prices they would be safe to lose money.

16,065. That may be one reason why they continue?—Very likely.

16,066. (*Chairman.*) I understood you to say that until three years ago they were rather adding to their holdings than not?—I think what I said was this: these men become possessed of more stock as they go on, and rather than sell stock at a depreciated price they had hired cheaper land with the idea of getting right one day or other.

16,067. And they are gradually adding to their stock?—Yes.

16,068. Apart from these men who have taken a large number of farms and putting aside the last three exceptionally bad years do you think that the farmers at the reduced rents in average years can make it pay?—Not with the prices which now exist or which have existed during the last three years. I am speaking now of arable farms. We have very little good pasture land in Norfolk, and generally speaking you may say that nine-tenths of the farms in Norfolk are under the plough.

16,069. Do these large farmers farm the land well?—Yes, they farm the land generally speaking very well.

16,070. With an abundance of capital?—They have the command of considerable capital which they employ very judiciously.

Report on America to Duke of Richmond Commission.

16,071. Now what are the remedies which you have to suggest?—I think the prices which now prevail are mainly due to foreign competition. I should like to be allowed just to make one statement with regard to the American report which Mr. Albert Pell and I made in the year 1879 to the Duke of Richmond's Commission. We have been continually told that we said there that America would send no wheat under 40*s.* a quarter. We never pretended to prophecy, of course we did not know. We did not do anything more than record the prices as we found them then in America, that is to say

Mr. C. S. Read.
2 Apr. 1894.

with regard to the cost of growing wheat, the freight first of all to the sea board, and thence from New York to Liverpool, the handling in America and the charges at Liverpool. But we also said this which I hope I may be allowed to read. After we had summed this all up we said:—"Though it may be generally said "that if the cost of production exceeds the value of "any article, that article will soon cease to be pro- "duced, it must be remembered that America has a "yearly increasing surplus of bread stuffs and meat "which she must sell at some price. In round "numbers it may be said that nearly three quarters of "that surplus in average years finds its way to the "United Kingdom. Except in seasons of general "scarcity the other countries of the world do not want "and certainly will not receive this surplus except "upon payment of heavy import duties. It may, "therefore, follow that however low prices rule in "England, the major part of the grain and meat "exported from the United States will still find its "way to these shores. And whenever there shall be "an abundant harvest in the old world and in the new, "prices may be depressed to a considerably lower level "than those quoted in this report." Therefore so far as that goes I hope that we shall be absolved from having prophesied about the future of prices.

Competition with America.

16,072. Can you form any opinion at the present moment as to the future?—No I cannot; but I can state this, that I know from what I have heard and from letters that I have received that the American farmers are as badly off as the English farmers, that is those who grow wheat. I know this fact that whereas the wheat area in the United States in the year 1885 was nearly 40,000,000 acres, in 1892 it had been reduced to 34,000,000 acres, notwithstanding that there was an increase of 9,000,000 in the population. I said when I came back from America that if I could tide over the next 25 years I should not fear American competition. I say that now. Fourteen years have gone by and if I should survive for the next 12 years I do not believe that the American competition will be anything like so severe as it is now.

16,073. Then you look rather hopefully as regards the future?—As far as regards America I do. I do not believe that the competition there will be so severe as it has been, but when it is to cease I do not know.

Duty on wheat.

I should not advocate as a remedy any protective duty; but probably I might be allowed just to point out the reckless and foolish way in which a nice little revenue was thrown to the dogs when the shilling duty on foreign corn which Sir Robert Peel, I think, characterised as a registration fee or a market toll, was abolished. In the year 1893 that revenue would have been 1,163,000*l.* I would call the attention of the Commission to the enormous increase that there is in the importation of flour as compared with wheat. I think I may say this, that whereas in 1873 there were 10,000,000 quarters of wheat imported in the year 1893 there were 15,000,000 quarters which is something like 50 per cent. more. In the year 1873 the quantity of flour was 1,800,000 quarters and in 1893 very nearly 6,000,000 quarters, and that is an increase of 300 per cent. This has a double effect upon us. It has entirely ruined the small millers in our district. I suppose we had certainly one windmill on an average in every parish, but they are almost all of them gone now. Small water mills are shut up, and consequently the milling trade is very much depreciated; and we have very few big millers that seem to stand. At the same time it has deprived us of the pollard and the bran which are so essential to our agriculture, and which we should have if the foreigners would send the wheat to us instead of the flour. It is a most remarkable fact that the price of bran at the present time is exactly the same as the price of wheat, and that it is almost as dear as flour, showing that there is a great loss to the agricultural interest in that way.

Importation of flour

16,074. (*Mr. Chaplin.*) If we get flour cheaper we have to pay so much more for the bran?—Yes, the public get the benefit of the flour and the poor unfortunate farmer has to pay now for his bran. I think I said in the letter which I addressed to you last year, when you kindly asked me to atttend, that I had no remedies to suggest for the alleviation of this great disaster. I would make one suggestion with regard to the land tax, that is that I think it certainly ought to be given over to the counties in aid of the county rate. I would also like that a considerable amount of the taxes which now fall upon land and houses should be augmented either by further subventions from the Imperial Exchequer or

Taxation.

that there should be a property tax assessment instead of the present assessment.

Mr. C. S. Read.
12 Apr. 1894.

16,075. (*Chairman.*) When you spoke of this difficulty about bran and wheat and flour, you did not imply by that did you that you desired a protective duty upon wheat, though you look regretfully upon the abandonment of the 1*s.* a quarter?—Of course it would be considered to be protection to the millers if you were to suggest a small duty upon flour, but I should hail it with great satisfaction myself, and I am sure of this that it would not in any way increase the price of the poor man's loaf, not by the homeopathic part of a farthing.

Duty on wheat

16,076. You would not consider 1*s.* a quarter to be protection?—No, I thought it was a very fair source of revenue.

The Agricultural Holdings Act.

16,077. Then with regard to the Agricultural Holdings Act, you have, I think, for many years given great attention to that subject?—I have. In the first place I do not find much fault with the Agricultural Holdings Act. Sir Gabriel Goldney said that in his part of the world when a tenant took a farm he was thinking of leaving it. If he is paying 45*s.* an acre for his land I dare say he is; but how he is going out is the last thing I think that the farmer is thinking about. When he takes a farm he rather expects to remain there during his life. With regard to the Agricultural Holdings Act, I think it is an exceedingly fair Act if it were properly administered. I find fault more with the administration of it than I do with the Act itself. With your permission I will say what the Norfolk Chamber of Agriculture has suggested with regard to its amendment.

Claims and counter-claims.

16,078. How is it badly administered? What do you mean by that?—I mean to say this, that first of all there is no limit to the counter claims of the landlord. The next thing is that as interpreted with us a tenant under this Act must claim specifically under the Act and nothing else, and if he has any advantage in his lease or agreement or custom, he is not allowed to bring that forward to augment his claims, whereas the landlord can claim his lease or the agreement or the custom of the country, or the Act against the tenant. We say that first of all the landlord's dilapidations should be scheduled so that you may know what he can claim under, and then we say further that his counter-claims (there is no limit to them so far as regards time), should be made the same day as the tenant puts in his claim. The tenant is bound to give two months notice before the expiration of his tenancy, whilst the landlord is allowed an indefinite time to claim until such time as the award takes place. We say that the landlord ought to make his claim on the same day, which should be 28 days before the termination of the tenancy; and that the only other addition that the landlord should be allowed to have is this: that he should be allowed as far as regards the buildings to have 14 days after the expiration of the tenancy to bring any counter claim against the tenant for any damage that he may cause to the buildings in the removal of his fixtures, or his furniture, or any damage that may have accrued by the neglect of the tenant up to that time.

16,079. I presume what you mean rather is this, that the method of the Act and the restriction put upon the claims of the tenants rather invite the landlords to make counter-claims?—When a man claims for his hay and his turnips and those sort of things, as a matter of course, everybody knows that he is justified in making the claim, and he is paid for it; but if you make a claim under this Agricultural Holdings Act, it is a sort of declaration of war against the landlord. Instead of receiving it as they would receive the other items of his claim, instead of its being accepted as a matter of course, land agents generally speaking hunt up every possible dilapidation and default on the part of the tenant, and bring it against him. I have seen one claim on a small farm of no less than 96 different dilapidations brought against the tenant, and some of them as low as 1*s.* 6*d.* With regard to the time that these claims are allowed on the part of the landlord, I might, perhaps, be allowed to instance my own case. I made a claim for compensation for unexhausted improvements on the 11th day of August. I think it was on the 14th of August that I discovered that I had not embraced one small item, and therefore I tried to amend my claim. The lawyer of the landlord said, I think, that eight weeks was not two months, and so I was debarred from making that claim. The

Mr. C. S. Read. 12 Apr. 1894.

landlord made a claim on the 28th day of December, and it was allowed by the arbitrator. I do not say that the claim was allowed, but the landlord was allowed to put it in. It was not until the 11th day of March that I received a cheque for the award. I only asked for 50*l.*, and by all sorts of dilapidations, which I did not know existed, my claim was reduced to 16*l.* I had turned that farm of 170 acres "from a wilderness into a cultivated garden," to use an expression which was made at our Chamber of Agriculture. 6*l.* out of the 16*l.* was the cost of the arbitration to me, and the 10*l.* I gave to the Royal Agricultural Benevolent Society. That is my experience.

16,080. (*Mr. Little.*) What time was it you went out, the 11th of October?—Yes.

16,081. (*Chairman.*) I presume you will say that if there was a limit of time to the tenant making his claim there should be the same limit to the landlord?—Yes.

16,082. You could not insist upon both claims being made on the same day, but you would put the same limit to both?—I would have both made on the same day. If the landlord cannot tell what the tenant has been doing to deteriorate his property, one month before the expiration of his tenancy, then I think he has not looked after his property carefully and well.

16,083. What did you mean by saying that the landlord's claim should be scheduled?—In the Bill that the late Mr. James Howard and I brought into Parliament several years ago we had a schedule of dilapidations, and I think that that ought to have been inserted in this Act.

16,084. That there ought to be some schedule under the Act defining what the landlord's claims may be?—Yes.

16,085. And giving some measure for the damages under them?—I do not think that; but I think we should know as tenants what the landlord can claim against us.

Arbitration.

16,086. Do you think that the method of the Act referring to arbitration and each side choosing its own arbitrator and the two appointing an umpire, is an expensive one?—What I think we have agreed upon at the Chamber of Agriculture is this: that as far as regards the umpires the list should be prepared by the county council and the Board of Agriculture should sanction.

16,087. In any case of dispute throughout the country?—No, I do not mean that; but if the Board of Agriculture thought there were some men put on the list who were not entitled to public confidence, they should be able to strike them off, that is all.

16,088. At present the umpire can only be appointed with the consent of both parties?—Just so.

16,089. Therefore one must presume that he has the confidence of both parties?—Quite so.

Suggested amendments to the Act.

16,090. What change would you recommend in that respect?—We only say this: we wish the list of the umpires to be prepared by the county council and to be approved by the Board of Agriculture. As to the amendments of the Agricultural Holdings Act we think there should be a record of the condition of the holding upon entry, either upon the agreement or upon the valuation, whichever you think best; but that there should be a record of the condition of the holding upon entry.

16,091. (*Mr. Chaplin.*) When you say "we" whom does that represent?—It represents the Farmers' Club and the Norfolk Chamber of Agriculture, and a committee which has been appointed by the Central Chamber of Agriculture to consider the amendments necessary to the Act.

16,092. The committee appointed by the Central Chamber of Agriculture has not yet agreed to its Report, has it?—It has not agreed to it; but we have agreed to those recommendations so far.

16,093. But there is no report agreed to by the committee in the sense that you can state that that represents their final opinions; am I not right in saying that?—I think I may say that what I am going to express will be the definite recommendations of this committee.

16,094. "Will be!" That I think is quite possible; but still it has not yet been definitely settled?—No.

16,095. And cannot be quoted as the final opinion of that committee at present?—No, only so far as the unanimous vote of the committee can make it.

Mr. C. S. Read. 12 Apr. 1894.

16,096. But it has still finally to be settled?—It has still finally to be settled.

16,097. (*Chairman.*) Then I think we had better take them as your own recommendations?—You can take them as the recommendations of the Norfolk Chamber of Agriculture, certainly.

16,098. What are the recommendations?—I think I have said that we recommend a record of the condition of the holding upon entry; then that continuous high farming with good and clean cultivation should be scheduled for compensation, which should be put into the third schedule; then, that the landlord's dilapidations, as I have said, should be scheduled, and that his counter-claim should be made on the same day as the tenant's, with a right to amend for any damage to buildings within 14 days after the expiration of the tenancy.

Compensation for high farming.

16,099. When you say that continuous high farming should be scheduled, do you propose that there should be any limit put to compensation in that respect?—No, there is no limit to be put to it; it is to be scheduled just the same as the manures and the feeding stuffs.

16,100. You would not propose, then, that a certain number of years' rent should be conceded. One does not quite see what the limit of compensation should be in such a case?—We have had a case which is known to the gentlemen who come from the north, in which a certain farmer, having laid down land to grass, and having, for, I fancy, 15 or 16 years, spent a large quantity of cake upon that land, was awarded by an umpire for that continuous high farming, which we in England are debarred from claiming.

16,101. I suppose in such a case the tenant on leaving would be entitled to compensation for laying down the land to grass?—No, unless he had the permission of the landlord.

16,102. I mean with the permission of his landlord?—With the permission of his landlord, he would.

16,103. And he would also get compensation under the schedule for cake?—For the last two years, and nothing for the previous 15 years.

16,104. (*Mr. Little.*) That is not the provision of the Act, is it; it is the practice?—It is not the provision of the Act, but it was allowed in that one instance, and we think it should form part of the amendment to the Act.

16,105. (*Mr. Chaplin.*) How many years is he to be compensated for the cake?—That must be left to the umpire. If it is on arable land, he would not ask for it, I should say, beyond two years.

Compensation for home-grown corn.

16,106. Is not this compensation for continuous high farming and clean cultivation to apply to arable land?—Yes, the clean cultivation is. Then compensation should be given for home-grown corn, that is to say, corn that is grown on the holding: the opinion in favour of that has been unanimous, I think, with the exception of whether that should apply to corn that is consumed by cart horses. I am of opinion that it should not extend to the corn that is consumed by cart horses, for they are not always on the farm, and they do not deposit a great portion of the manure upon the land at all. Where a man grazes colts I think it is different; if he keeps a yard of colts and grazes them with corn instead of keeping a yard of bullocks, I think that should be allowed.

16,107. (*Viscount Cobham.*) How is a tenant to prove the amount of wheat that he has consumed on his holding?—I think it is very possible to do that. I had no difficulty in proving it when I left these farms I am talking about. I took them off the home farm and put them on to the other. I think it would be just as easy for a tenant to prove from his books and from his men what corn was consumed upon the holding. Then the other suggestion is the two years or older grass seeds to be paid for, if a good plant, and the land clean and in good heart. Generally speaking, on the light lands of Norfolk, now, instead of keeping to the four-course, they lay down some of the worst lands for two or more years' seeds, and when the tenant leaves, we think that he should be compensated for that unexhausted fertility which the seeds would give even if they were to be ploughed up for the purpose of corn. Then there is a proposal to take some items of the first schedule and put them into schedule two, and then add

Further suggested amendments.

Mr. C. S. Read. 12 Apr. 1894.

to the third schedule "any other improvement increasing the value of the holding as an agricultural holding, for which the tenant is not otherwise compensated." If you pass all those resolutions as an amendment of the Act, or as a new Act, I do not think that the landlord will be in any way damaged, and I think you will have more chance of getting the tenant to give up his farm in a clean and fertile condition; because I do not hesitate to say now that it is very much better for any man in the county of Norfolk to give up his farm foul and poor, than it is to give it up clean and fertile.

16,108. How would you provide for a case like that you mentioned of your own where you have taken a farm in bad condition at a low rent for a year or so, to be increased afterwards when you have got it into good condition?—We have said that any deduction from the rent in consequence of the foul condition of the farm is to be taken into consideration.

Restricted cultivation.

16,109. (*Chairman.*) Then with regard to restrictions on cultivation, do you consider that any change may be made in that respect?—Generally speaking now-a-days the restrictions on cultivation and the sale of produce are reduced to a minimum. I think it is rather a remarkable instance that Lord Leicester's leases, which are for 20 years, allow an unconditional cultivation and sale of produce during the first 16 years of the lease, and that they are to be brought into the four-course during the last four years of the lease, and at that period, that is at the end of 16 years, it is supposed that the farmer and his landlord will come to terms as to whether there should be an extension of the lease or not. Notwithstanding that very generous permission on the part of Lord Leicester that his tenants should farm exactly as they like during those first 16 years, I think I may say that in the great majority of instances still they adhere to the old four-course system of cropping. It is a light land district principally, and that course of cropping seems to be best adapted to it. Then we have some estates, some of them near Norwich, and advantageously situated with regard to railroads, where there are the most stringent regulations against the sale of produce and of cross cropping; the tenants take not the slightest notice of those restrictions; they sell off as a rule now-a-days just what they can, and it is only in the case when a man leaves his farm that these restrictions are brought into play, and then he has to pay for them. I might say that these old restrictions have been very much got rid of since this Agricultural Holdings Act has been in operation, and that a good many of the agreements contain clauses giving compensation to tenants better even than the Act itself. The old leases which the family lawyer used to impose upon the tenants have very much died out, and, as I have said just now, where it is kept up it is not as a rule enforced.

16,110. Then you think that a great improvement has already taken place in this respect?—I think so.

16,111. And that it is hardly necessary to legislate upon the subject; is that your opinion?—I do not believe it is a subject for legislation at all, I cannot think that, any more than rents and land courts, and those things. We do not want that; we only want this, that when a tenant leaves his holding he should be substantially compensated for the improvements that he leaves behind him.

Judicial rents.

16,112. Is there any movement in your district among the farmers in favour of judicial rents or arbitration on rents?—One man in a thousand, perhaps, might be foolish enough to argue it, but I have never heard any farmer ask for it.

16,113. I only want to know?—No, there is not really; we do not think of such a thing as that in the County of Norfolk that I know of, I have never heard it advocated.

16,114. Has it been discussed by your Chamber of Agriculture there?—Yes, we always have one or two fiery spirits who go in for all sorts of reforms and revolutions; we let them talk and we do not take any notice of what they say.

16,115. Has it been put to the vote there?—Yes. I do not say that has, but similar sort of ideas have been to put the vote and they have been in a miserable minority.

16,116. (*Mr. Lambert.*) What would you term "similar ideas"?—That is a large subject rather, is it not?—I mean similar ideas with regard to the land legislation that has been enforced in Ireland.

The law of distress.

16,117. (*Chairman.*) Are there any other points you desire to bring under the notice of the Commission?—I do not know whether I should be asked my opinion about the law of distraint.

Mr. C. Read. 12 Apr. 1894.

16,118. Yes, we should be glad to hear it?—It is a subject on which I really have no very definite opinion. As a large farmer with a fair amount of capital, I think it is rather prejudicial to my interest, but regarding farmers generally, those that are poor, and those that are small, and the man who is taking land with a little capital, especially these new small holdings, I think that it would be prejudicial and that it should not be abolished altogether. The Committee, I think, of the Central Chamber have said that they would prefer six months instead of 12, but I think 12 is fair. It only gives the landlord a right to distrain for one year's rent, and I am not aware, taking it all in all, that I should recommend any alteration in the law. Of course if I was a merchant or a dealer or anything of that sort, I might be of a different opinion, but as far as regards the farmer I should continue the law of distress as it is.

The marking of foreign meat.

16,119. Is there anything else you wish to say?—With regard to foreign meat, some people would have it all marked. I should not go to that extent, but I do say that the vendor should be licensed to sell the meat, that he should have it over his shop door and on his carts, and state it also upon his bill-heads. I think that would be quite sufficient, and I think it is only fair to the British farmer that that should be done. I am fearful that not much good will come of the Feeding Stuffs and Fertilizers Act which was passed last year. We in the county of Norfolk were going to have an analyst with a large laboratory and all that sort of thing at the command of the county; we were going to spend 750*l.* a year upon establishing a chemical station, but we have come down to appointing an analyst at 100*l.*, and although the Act has now been in operation, I suppose, for four months, we were told that we should have samples come in by thousands to be analysed, we have had four samples only, two of which I have contributed myself.

Feeding Stuffs and Fertilizers Act.

16,120. (*Mr. Lambert.*) What are the fees of the analyst?—The fees of the analyst are half-a-crown, paid by the farmer, but they are supposed to represent 10*s.*, 7*s.* 6*d.* being paid by the county. I think one of the great drawbacks is the instructions which the Board of Agriculture have issued with regard to the taking of samples. They are very complicated, and a farmer, whatever is his other virtue, is not a very exact man. First of all, I think within three days you have to give notice to the seller; then you have to wait three days for his coming to take a sample; then, if he does not come; we will say you have five tons of manure, you have to take promiscuously a sufficient quantity, we will say 10 cwt. of that and mix it altogether from the different bags You then have to take three different samples in the presence of a witness, he has to witness the mixing as a matter of course; they have to be sealed in his presence and signed in his presence, one of those samples is to be kept, the other is to be sent to the vendor, the third is to be sent to the analyst, and by the time you have done this you have taken so much trouble and spent so much time that the majority of farmers, I do not think, will go through that ordeal. Then there is another reason why we should not. We have had in all our Chambers of Agriculture almost invariably an exceedingly good chemist attached to those Chambers of Agriculture and, of course, we have had the benefit of their analyses at a very cheap cost. The fees were half-a-crown for the purity of any feeding stuff, and 5*s* for the quality of any manure. If a farmer could not afford to pay that he would not take the trouble to go through all this formality for these samples.

16,121. (*Chairman.*) I suppose the object in this case under this Act is to get evidence against the vendor?—It is.

16,122. Therefore it is necessary for that purpose, to be very certain that the article is that which was sold and a fair sample of it?—Yes. I do not doubt that it is quite necessary; but there is just this difference, that the moment you give this notice to the vendor who has sent you this manure, he regards it pretty much in the same light as the land agent does when he receives a notice for the tenant's claim under the Agricultural Holdings Act.

16,123. Quite so, but is not that almost a necessary incident of an attempt to secure evidence against the vendor?—Yes, I think it is, and it is another instance of the impossibility of making people put an Act of Parliament in force after you have passed it.

Mr. C. S. Read. 12 Apr. 1894.

16,124. You would rather trust to the ordinary security of a man consulting an analyst without the necessary consequence of taking proceedings against the vendor?—I should have done so; but now the Act is passed I think we ought to try all we can to carry it out.

16,125. But how can it be carried out with due security that the sample is a fair sample of the product sold by the vendor so as not to be be unfair as against the vendor, that is the difficulty?—That is the difficulty no doubt.

16,126. Have you any suggestions to make as to how those difficulties may be overcome without unfairness to the vendor? —No.

16,127. You raise a substantial difficulty. What the Act aims at is to secure evidence upon which you can convict the vendor. The moment you come to the question of evidence in a criminal proceeding you must be very careful that everything is done in justice to the vendor and that necessitates all these elaborate precautions that this and that is to be done in the presence of a witness and this and that sample is to be a fair sample of the whole bulk. The question is how that process can be got rid of and the process simplified with due justice to the vendor?—I do not think you can: therefore I do not believe the Act is going to do us very much good.

16,128. Not going to do what was expected?—No.

16,129. Then I gather that you think it is a greater security to the purchaser to adopt the old process of sampling and sending it to an analyst and getting an opinion without the legal consequences which follow by this Act?—Yes. Of course a man could take legal proceedings before the Act and farmers have often done that and got compensation.

16,130. But then of course that involves a trial and legal expenses, and the object of this Act was to avoid all that by getting an official determination of the fact as against the vendor but necessarily accompanied by security in favour of the vendor?—Yes, but I do not remember any case when it was proved to demonstration that the manures or feeding stuffs have been adulterated but what either the manufacturer or the vendor compensated the farmer without going to a Court of Law.

The Weigh-bridges Act.

16,131. (*Viscount Cobham.*) There are two points that I should like to hear your opinion upon before you finish. One is with regard to the Weigh-bridges Act?—That is a most excellent Act, and that is another illustration of what you might try to do for the farmer, but he will not avail himself of it. I think that at Norwich there have been 20,000 cattle exhibited, and I do not think above 50 of them were weighed.

16,132. (*Mr. Chaplin.*) When you say "exhibited," do you mean sold?—That have come into the market to be sold.

16,133-4. (*Viscount Cobham.*) The farmers do not care about it?—They do not care about it. I think they dislike anything that first of all impugns their judgment, and, in the next place, that causes them any trouble.

Mr. C. Sewell Read subsequently furnished the following figures:—

NORWICH CATTLE MARKET.

	No. of Cattle exhibited.	No. of Cattle weighed.
1891	98,522	221
1892	115,869	166
1893	115,071	436

KING'S LYNN CATTLE MARKET.

	No. of Cattle exhibited.	No. of Cattle weighed.
1891	29,244	74
1892	32,120	67
1893	30,180	43

16,135. (*Mr. Chaplin.*) Is it not very much owing to the attitude of the butchers that very often they refuse to buy, or lead people to think they would refuse to buy cattle from those who do insist upon having them weighed?—I have heard that. I always have my cattle weighed; they go to the auction and the weight is stated, and the butchers and the dealers take little or no notice of what is stated. They go by their own judgment, but it is a satisfaction to me to have them weighed, because I do not pretend to know. The majority of farmers fancy they can judge a bullock within two stone, and they may be 10 stone out.

Mr. C. S. Read. 12 Apr. 1894.

Ground game.

16,136. (*Viscount Cobham.*) As to the Ground Game Act, have you anything to say?—The Ground Game Act has been very useful in our part of the world; we have got rid of the over preservation of ground game to a certain extent. The only grievance that I think now-a-days exists is when the shooting is let, and that is very generally the custom now in Norfolk for impecunious landlords to let the whole of their estate to some shooting tenant. The farmers do not like these game tenants. For myself, I am very much obliged to them, they spend a lot of money with us. I do not say that they spend it well, but at the same time we are glad of anybody who spends money. I do not like them when they buy partridges' eggs which they must know are stolen; but otherwise I do not object to these gentlemen coming and having their sport, if they call it sport, to raise up thousands of pheasants and shoot them down in one day. But what the farmers complain of is this, that they think they ought to be allowed when damage is done by the game tenant, to have that damage paid by their landlord rather than by the game tenant. I do not know why that cannot be done now, but that is the feeling that when there is damage done by game, and there is a good deal of damage done even by pheasants when they are kept in the very large quantities that they are now, artificially hatched and reared, and the farmers think that they ought to have some compensation. Then, in the case of hares and rabbits, I heard Sir Gabriel Goldney say that he had to erect wire fences against a neighbour. Well, that is very often the case that you have a neighbour who stocks a wood with a lot of hares and rabbits, and it is impossible for the farmer to catch them or to destroy them, you are not allowed to trap above ground, and you cannot protect yourself against the ravages of hares and rabbits from the neighbouring wood.

16,137. Do you think the cost of the wire should be defrayed by the shooting tenant?—I think he ought to be bound to keep his ground game within the wood.

16,138. You cannot get rid of the shooting tenants in Norfolk, I presume?—No, I do not think we ought to get rid of them.

16,139. Is there not a good deal of land in Norfolk more valuable from its sporting qualities than from its agricultural qualities?—I think there is a good deal, and that is extending very much. Shooting rents are going up and agricultural rents are going down.

The Agricultural Holdings Act.

16,140. I do not think you fully answered the Chairman's question as to the administration of the Agricultural Holdings Act. I understood you to say that you thought it a good Act if it had been properly administered, but the fault you found in your subsequent answer, I think, was mostly with the Act itself?—I do not think I am wrong in stating that in the county of Norfolk not one per cent. of the tenancies that changed hands this last Michaelmas came under the operation of that Act. It was considered when the Act was passed that almost every tenancy that changed hands would come under the operation of the Act. I am quite ready to admit this: that farmers are so poor that they leave the land now in a much worse state of cultivation than they did years ago, but at the same time I am quite convinced of this that the way in which counterclaims from landlords have been admitted has so frightened the tenants that they, you might say, bounce the tenants out of the claims altogether. No sooner does a tenant make a claim than the counterclaim of the landlord is put in considerably above the amount claimed.

16,141. That is an objection to the Act, and can only be removed by a change of the Act, or do you say that the valuers under the Act have not acted fairly?—I say the valuers under the Act do not like the Act, and whatever you may do as far as the county of Norfolk is concerned I do not believe that the Act will ever come into general operation.

16,142. Has not the Norfolk custom superseded the Act to a great extent?—We have no custom as far as

regards tenant-right in Norfolk, no custom at all; and that is the reason why we want it most and we get it least.

16,143. So that every farm is under the Agricultural Holdings Act as regards tenant-right?—It would come under the Agricultural Holdings Act; but please to remember this fact, that I have also stated that there are a great number of agreements which are under the Act which are a great deal better than the Act itself, or at least they are what we can understand better.

Compensation for high farming.

16,144. When you state that you think high and clean farming should be scheduled and compensated for, do you mean that the simple maintenance of a farm that was entered upon in high condition, should be the subject of compensation?—No, that is the very reason that we say there ought to be a record at the commencement of the tenancy of the state and condition of the farm, and if it was proved when the farm was taken that it was clean and in high condition, of course there would be no sort of compensation when the tenant left.

16,145. It must be an improvement of the state?—It must be an improvement of the state. If it was said that the farm was let at a reduced rent in consequence of the foul condition and impoverished condition in which it was taken, then if the man had improved it still there would be the set-off of the reduced rent.

16,146. That would supersede all such arrangements as you have made with regard to your 320 acres which you have had at a reduced rent for the first year and an increased amount afterwards?—Quite so. That extra 50*l.* which I ought to have paid in the first year I should be supposed to have spent in cleaning the land, and so I should not get anything.

16,147. I do not quite see the grievance in your own case which you quoted to us. You only asked for 50*l.*?—No.

16,148. Although you turned that into a garden which was previously a wilderness?—You could not under the Act claim more. I had had it 16 years, and I had spent most of that money during the first four years of the tenancy.

16,149. Then you would amend the Act so as to have brought in the whole of your improvements for 15 or 16 years?—I think in view of the fact that I had drained and cleared that land during the first four years of the tenancy, and that the drains were in proper order, and that the cultivation was perfect, I ought to have got something for it.

16,150 The reduction of the rent being allowed as a set-off, I suppose?—There was no reduction in that case; the land was hired in good times and given up in bad.

16,151. Do you make any complaint as to the counter-claim in that case; it was not large?—I do very much. I say the counter-claims were vexatious and frivolous; some of them were allowed, but the majority of them were struck out.

16,152. You think that the valuer was mistaken in awarding so much under the counter-claim?—I think if the valuer had to go over it now he would not allow some of those counter-claims at all.

Expenses of farming: (*a.*) Cost of labour.

16,153. In your evidence you told us that the expenses of farming had very largely increased; I do not think you entered into detail about that?—The expense of labour, I think I said.

16,154. Since when?—We will say within the last 25 years.

16,155. Have they decreased the last few years?—I have not been able to decrease the quantity of labour although I have all the modern machinery that a farmer has. I have all that at my disposal, yet I have to keep more horses in order to work this machinery, and I still pay a considerable sum more for manual labour than my predecessor did.

16,156. Do you keep as many labourers?—Yes.

16,157. But there has been a fall of 15 per cent. recently in the wages?—There has been a fall of 10 per cent. in the last three or four years.

16,158. But they are still higher than they were 10 years ago are they not?—No, but you have to employ more men to do the same work.

16,159. Is that owing to the quality of the labour having deteriorated?—The young men now-a-days, take no sort of interest whatever in the work of the farm; the young men are the most unskilled race of labourers that you can imagine. If you wanted a ploughman, or if you wanted a man to drill, or to hedge, or to ditch or to drain when the old men die off that we have now, I do not know where we should go to find them.

16,160. At the same time you have lost the women's labour, and, to a great extent, the boys' labour?—Yes, and we have got rid of almost all the bright and intelligent, and the strongest of our labourers, too; they go away. They are very fond of coming here to the police force in London, and they like to go on the railroads, and like to come here and drive the tramcars, and cartage generally about large cities.

16,161. Have you compared your labour bill of 20 years ago with your labour bill of 1893?—Yes, they are very much about the same.

(*b.*) Cost of artificial food and manures.

16,162. In what other direction has there been an increase of expense?—We use a great deal more artificial food, we keep more stock.

16,163–4. The food itself is cheaper than it was?—Corn is, certainly, but I do not think that oil cake, which is the chief artificial food that we use in Norfolk, is much cheaper than it was; it is now from about 8*l.* to 9*l.* a ton, and probably it was 9*l.* or 10*l.* a ton.

16,165. Has not artificial manure fallen considerably in price?—Some qualities of phosphates, for instance, are very cheap, much cheaper, and they are better made than they were. Take nitrate of soda, which is a nitrogenous manure that we use very largely, that was cheaper, but now, by a corner or a ring, or something of that sort, restricting the output, the price is raised, I think, 2*l.* per ton within the last six months.

(*c.*) Rates.

16,166. Have your rates been about stationary?—I should say that our rates have rather fallen; but they are quite as much per acre as they were in consequence of the diminution of the assessments. Some of them, of course, have gone up, the highway rate is considerably increased, and the poor rate is sensibly diminished, I think, from 10 or 15 years ago.

(*d.*) Rent.

16,167. And rents have fallen from 30 to 75 per cent. in Norfolk?—I said from 15 per cent., please. I should say 10 per cent. most probably to 75 per cent.

16,168. Say an average of 33 per cent?—Yes, 33 per cent.

16,169. I still fail to see where the great increase in expenditure in farming comes in. It seems from your answers to preceding questions that the expenditure must have diminished rather than increased?—It depends upon how you farm. If you farm after the manner of Sir Gabriel Goldney and keep to only the produce on the farm and do not go outside to spend your money, why, I daresay the expenses are decreased.

16,170. I am assuming that you are farming in much the same way as before?—We do not farm in the same way as before. We find that our only hope of getting on is to keep more stock and better stock. We have increased the amount of stock and diminished the area of corn.

Sizes of farms.

16,171. What are the sizes of farms in Norfolk—what limits do they run between?—On the large light land farms you have farms of 1,000 and 1,500 acres. In the good lands of Norfolk a farm of from 250 to 400 acres would be considered to be a fair sized farm, and there are farms that are from 50 to 100 acres. I would say, generally speaking, that a man who has kept the most stock, and he is invariably the larger farmer, has stood his ground better than the majority of small farmers who do not make beef, or mutton, or wool, but if the small farmer is a dairy farmer, if he can sell his milk, either delivering it on the railroad or to the large towns, he is the man who has stood the depression better. But then dairying is such a very small portion of our industry and never will be anything else. The only thing we can do, generally speaking, with dairying is to make butter. Now, at the present moment, although we have hardly a blade of grass in the county of Norfolk, butter is down to 11*d.* a pound. I consider that if you take the average price of butter at 1*s.* you do not get above 4*d.* per gallon for the milk. Then there is the skimmed milk afterwards, which is worth about 1*d.* a gallon

Price of butter.

16,172. It is a poor quality of butter, is it not, to fetch 11*d.*?—I think I have as good a quality of butter which goes into Norwich market as anybody and that is all I can get. With regard to the small farmers, and farmers generally in the county of Norfolk, you never

Mr. C. S. Read.
12 Apr. 1894.

can be positive of making the same quality of butter every week. There are some conditions which you cannot have except in a factory. If you have a factory, by scientific arrangements you can generally secure the same qualities of butter, but with small dairies you cannot secure that. In the month of May I am quite positive of this, we shall have butter down to 9*d.* Danish butter comes in, and it is now selling at 1*s.*; it is better than ours because it is uniform—you see it ticketed up everywhere, Danish butter 1*s.* a pound.

16,173. (*Mr Lambert.*) Might we know the price it costs to get the butter from the farm to the consumer?—That depends on where the consumer lives and where the farmer lives.

16,174. Of course, I refer to the average price?—I have nothing to do only to put my butter upon a carrier's cart, and he takes it to Norwich and delivers it to the shop.

Income tax.

16,175. (*Viscount Cobham.*) As to the account which the farmer has to produce to the Income Tax Commissioners when he applies for a reduction of income tax; is it a regular profit and loss account, or is it sufficient to produce his bankers' book?—He has to produce the cash book and a balance sheet for the year.

16,176. Very few farmers will do that?—Very few farmers, I am sorry to say, do that.

Cost of labour.

16,177 (*Sir Nigel Kingscote.*) You gave us the amount you paid for wages in four different years, three of which were over 800*l.*, the other being 797*l.*, that is upon a farm of 400 acres?—Yes.

16,178. And may I say all arable?—Nine-tenths of it is arable.

16,179. Is that not a very heavy charge for labour? Do you think farms in your neighbourhood would all run to that rate for labour?—No, I should say that generally speaking it would be 30*s.*

16,180. 35*s.*?—Yes, I think it would; certainly, 30*s.*

16,181. On arable land?—Yes, and if you put it down to grass, which we are, I suppose, compelled to do now, it would be 5*s.* to 7*s.* 6*d.* possibly.

16,182. It would go down to that?—Yes.

16,183. How many arable acres do you put to a labourer? Have you made that calculation?—No. I have not. I am a very profuse employer of labour I believe. I keep the farm as neat as I can.

Norfolk custom.

16,184. In your agreements, or in your non-agreements in Norfolk generally, are there any restrictions as to cropping and are they carried out, or is everybody allowed to do pretty well as he likes?—On the estate on which I farm we have no agreement, not a scrap of writing.

16,185. Not even when you leave?—No.

16,186. No course prescribed?—No.

16,187. I suppose you are under a Norfolk custom?—You must go out under the custom no doubt.

16,188. That has not been altered?—There is nothing to alter if you have nothing. There has never been on that estate that I know of a single written agreement.

Labourers' cottages.

16,189. I wanted to ask you as regards the labourer, does the landlord generally find cottages for the labourers and keep them in his own hands or does he give them to the farmer?—If the cottage is really close to the farmer's house, if it is part of his premises, if I may say so, generally speaking it is let with the farm. But the cottages that are on the outside of the farms or in the villages are not let as a rule, or at least hardly ever, with the farms. I might say with regard to the cottages that there has been a great improvement in them in the last 30 years, especially on the large estates. You are aware that years ago the law of settlement was against cottages being built upon estates, and the open parishes were overdone with cottages, and in what they call the close parishes there were very few, but now I am happy to say they are very much improved although there are still some districts where they are exceptionally bad and generally speaking those are in the hands of small men who make a living out of cottages property.

16,190. Generally do the farmers insist upon having so many cottages with their farms?—No, not with the farms but they expect if there are cottages adjoining their farms that they should have the selection of the tenants.

16,191. You said you thought that it would be a very great advantage to the farmer if he would use the weigh-bridge more for fat stock?—I think so.

Mr. C. S. Read.
12 Apr. 1894.

16,192. What is your opinion as regards store stock?—I like to buy store stock with the weigh-bridge. Of course it is not so good a test as it is for a fat bullock, because there must be such a great difference between the qualities of the store stock.

The Weigh-bridges Act.

16,193. You think it would be a great advantage if it was used more for fat and store stock than it is?—I think so; and I have used it for store stock myself.

16,194. Did you say that in a district near you you could go for a long distance on land out of cultivation?—No.

16,195. Or that was in the hands of the landlord?—Yes, that was it.

16,196. Do you think it would pay for planting that land?—I think they might grow larch poles with advantage on a large quantity of the land.

Tree planting.

16,197. Or Scotch fir?—Yes, Scotch fir too, but Scotch fir is not so useful a wood as larch with us.

16,198. There is some difficulty I conclude about the game?—They could keep ground game out of it by just wiring it in, and I should think it might answer to plant a good portion of it.

16,199. You do not know any instance about you where planting has taken place on any large scale, do you?—Not on any large scale; but for a good portion of it—a good portion of the bad land has been planted in my time.

16,200. Do you think it will answer?—I think it answers in this way: if you have got a timber that is suitable for the repairs of your holding, but I do not think it answers very much to sell. Hop poles are no use to us, we have no demand for that sort of wood.

Price of butter.

16,201. (*Mr. Whitehead.*) I cannot understand the low price of butter that you speak of in Norfolk; is butter-making largely adopted in Norfolk?—No, it is not largely adopted in Norfolk.

16,202. Is that the reason that it is so bad, because it is not practised generally?—If you can get Danish butter at 1*s.* per lb., you will understand perfectly well that you cannot expect a second class butter, if I may call it so, to be worth more than 11*d.*

16,203. Then you admit that it is second class butter?—It is not a second-class butter. If you will allow me to explain that it might be the very best, it might be absolutely better than the Danish butter, but then, perhaps, next week in consequence of some atmospheric disturbance, or a change of food in the cow, or something of that sort, the butter would not be so good; there is not that regularity in the English butter that you can have in these imported butters, which all come from creameries or manufactories.

16,204. But that does not apply to all English-made butter, because from one's experience you get butter all the year round practically the same from English dairies?—If a man is a large dairy farmer of course he has the appliances for making a more even quality of butter, and of course he has the command of a larger number of cows. The smaller number of cows that you have the worse butter you are almost sure to make.

16,205. Does the Norfolk County Council encourage butter making—does it teach butter making?—We have exhibitions, lectures, scholarships, and all those sort of things.

16,206. Not thoroughly, probably, as the butter seems to be so indifferent?—I do not believe that the butter is worse than some other counties. If you have imported butter which you know to be thoroughly good, and you know it to be uniform, selling at 1*s.* a pound, how can you possibly expect the best butter, except it is some that is specially made for some special purpose, to be any more than 1*s.* a pound.

16,207. At the present time one is paying 1*s.* 4*d.* and 1*s.* 6*d.* for English-made butter?—That, most probably, is some fancy dairy butter; Alderney cows perhaps.

16,208. No; for ordinary English butter one has to pay 1*s.* 4*d.* to 1*s.* 6*d.* at the present time in most of the districts that I am acquainted with. Your figure seems to be an exceedingly low price; there must be some fault in the making?—I have seen Danish butter ticketed up here at 1*s.*; I saw it this morning. If you gentlemen like to go and give 1*s.* 6*d.* for English butter, we are exceedingly obliged to you.

Mr. C. S. Read. 12 Apr. 1894. Technical instruction. Butter making.

16,209. A great many people will not look at Danish butter?—I am glad to hear it. It is a wholesome prejudice which I hope will continue to exist.

16,210. Do you think more education is wanted among farmers to teach them butter making, and other things?—I think you may educate the dairy maids with considerable advantage. I do not know that the farmer has anything to do with the making of butter. I do not know anything about it.

16,211. As to the general education of farmers, do you think that is satisfactory and sufficient; is that one of the principle causes of bad farming?—The bad education of the farmer?

16,212. Yes?—Certainly not. You may have the most excellent theoretical farmers who are sure to come to grief.

16,213. Do you think that farmers are educated sufficiently?—I think their education might be improved; it might be more practical.

Mr. C. S. Read. 12 Apr. 1894.

16,214. More practical, not more scientific?—Yes, and more scientific too, if it was a science that you can bring into practice, but it is no use having a theoretical science that you cannot bring into practice on the farm.

16,215. Do you think that that will be accomplished by the work of the County Councils?—I hope so, but I do not think so.

16,216. May I ask what in your opinion is the principal cause of bad farming which you mention in your proof?—Simply that the produce does not pay the cost of production; that is almost the entire cause, I think, of the bad farming. Deterioration in farming.

16,217. Not from any fault or omission of the farmer?—That is so. You may get your farmers so poor that they cannot farm properly; but I apprehend there are no farmers in times past who have reared a larger produce from a naturally unfertile soil than the Norfolk farmers.

The witness withdrew.

Adjourned to to-morrow at 11 o'clock.

Twenty-ninth Day.

Friday, 13th April 1894.

PRESENT:

VISCOUNT COBHAM IN THE CHAIR.

The Right Hon. HENRY CHAPLIN, M.P.
Sir ROBERT NIGEL FITZHARDINGE KINGSCOTE, K.C.B.
ROBERT GIFFEN, Esq., C.B.
Captain OWEN THOMAS.
JOHN CLAY, Esq.
CORNELIUS NEALE DALTON, Esq., C.B.
ROBERT LACEY EVERETT, Esq., M.P.
JOHN GILMOUR, Esq.
GEORGE LAMBERT, Esq., M.P.
WILLIAM CUTLACK LITTLE, Esq.
CHARLES WHITEHEAD, Esq., F.L.S.

HERBERT LYON, Esq., *Secretary.*
R. F. CRAWFORD, Esq., } *Assistant*
FREEMAN THOMAS, Esq., } *Secretaries.*

Mr. CLARE SEWELL READ recalled and further examined.

Mr. C. S. Read. 13 Apr. 1894. Technical instruction. Butter making.

16,218. (*Viscount Cobham.*) I think you have a statement to make in explanation of one point in your evidence yesterday?—Yes, with regard to a question that was put to me yesterday by the honourable Commissioner opposite to me. He said, did I not think that a better education would improve the farmer? I said that as far as regards practical farming I did not think it would. Of course, it would make him a much more intelligent man, and a much better business man all round, but at the same time, as far as regards practical farming, it can only be acquired upon a farm, however much you may learn in theory.

16,219. But a practical man would be all the better for a certain amount of scientific knowledge?—Certainly—I meant that. I am sure we all want better education in the country, especially the farmer, there is no doubt about that.

16,220. (*Mr. Whitehead.*) It arose out of what you said with regard to butter-making. I think you gave us to understand that the butter manufacture was not of a very first-class stamp?—No.

16,221. It struck me that improved education, on that point at least, might be desirable, and so I asked you the question?—With regard to the butter, I as a farmer consider that that is a question for the mistress and the maid, and not for the farmer. We do not, as a rule, go inside the house at all. The dairymaid particularly wants to be educated; there is no doubt about that.

16,222. It would be desirable that a farmer should have knowledge to enable him to superintend, would it not?—It is so fractional a part of our farming in Norfolk that we do not think anything about it. There is one other thing with regard to the butter that I think I ought to mention, and that is the fact that we have, all through the winter months, to give our cattle a very large quantity of roots, turnips, swedes, or mangold wurtzels, and it is much more difficult to make a good quality of butter from roots than it is from hay or from grass.

Mr. C. S. Read. 13 Apr. 1894.

16,223. (*Mr. Clay.*) There is a question that has not been touched upon yet, which was considerably agitated many years ago, and I think it came principally from Norfolk and Lincolnshire—that was the abolition of the malt tax. What effect has that abolition had upon the tenant farmer and his barley selling?—I think that agitation came mainly from the eastern counties, Norfolk, Suffolk, Essex, Lincolnshire, and a few other counties. The effect of it has been that in consequence of a free mash tub being allowed, so many other ingredients have been used in the manufacture of beer, that the brewers do not brew with the same quantity of malt that they did formerly. In this year, particularly, the demand for barley has fallen off very considerably. Perhaps I might be allowed to give you just an illustration of the price of barley and of wheat taking it in the last month, March. In 1874 I sold barley at 48*s.* the quarter; now I think the average price is about 25*s.* The price of beer is precisely the same—there is no difference in the price of the beer. Might I compare it with the price of wheat please, just to show the gain that there has been to the poor man, particularly with regard to bread, and how the cheapness of the barley has in no way benefitted him. In March 1874 (I have this return from the largest miller in Norfolk), the average price of wheat was 62*s.* 6*d.*; flour per sack was 45*s.*; Malt tax.

Mr. C. S. Read.
13 Apr. 1894.

and bread was 7½*d*. In March 1894 the average price they paid for wheat was 25*s*. 4*d*.; flour was 21*s*.; and bread 4*d*. per 4 lb. loaf. So that although the consumer there does not get the full benefit of the cheapness, still at the same time he does get a very considerable pull, whereas as far as the barley is concerned he gets no benefit whatever.

16,224. So that the consumer has got no benefit from the price of beer, but rather an inferior article?—It is an inferior article in one way, and perhaps it may be improved in another. It is brighter and clearer than it used to be, and everything now a days must please the eye. Even with regard to flour, our paupers will not have the flour as it is furnished by the guardians, unless it is whiter than the driven snow, and that really means this, that a large portion of the best nourishment of the wheat is extracted from it—the muscle forming part of the wheat is taken out of that very fine flour, and a good old fashioned seconds flour is much more nutritious as an article of diet.

16,225. How much do you consider the alteration of the malt tax has decreased the price of the good barley in Norfolk, and in other places?—I do not think you can put it all down to the alteration in the malt tax, because before the malt tax was repealed, I think it was Mr. Gladstone who passed an Act allowing light barleys to be malted by weight, and therefore the thin foreign barleys which are now so much used in malting had just the same chance as they had before. Also the use of sugar was permitted. What has taken place since the repeal of the malt tax is that they brew from anything they please, rice or maize, raw grain, or anything they like.

16,226. What I am wanting to get at is how far it has interfered with the profitable sale of the produce of barley in this country since the tax was transferred from the malt and put upon the beer?—I am unable to say, except that it has gone down very much indeed; but there is still a good sale for the very first class barleys, of which there was a peculiarly small portion grown with us last year.

16,227. We have had evidence that the lowering of the price by the alteration of the tax is something between 5*s*. and 6*s*. a quarter?—I have no means of arriving at that conclusion, because there are so many other agencies that have tended to reduce the price of all corn, especially the importations of foreign barley which have been so much increased, and which are now so much used.

The Agricultural Holdings Act.

16,228. Regarding the improvement of that very important measure, the Agricultural Holdings Act, as far as I have been able to gather from your evidence you admit that the principle of the Act is sound?—Quite so.

16,229. The principle of the Act is both sound and good?—Quite so.

16,230. What you object to is that the procedure and the expense of going to law, and the extra expense involved have deterred many men, especially small farmers, from going for compensation under the Act?—I do not think that has done it so much as the counter-claims that have been brought against the tenant.

16,231. No doubt you will agree that the procedure and the law expenses and other expenses are very excessive compared with the awards given?—I think the charges of the valuers are out of all proportion to the sum of money that they award.

Claims and counter-claims.

16,232. Regarding the counter-claims you seem to think that that is the greatest bar against tenants using the Act?—I am sure it is.

16,233. Indeed, you went so far as to say that these counter-claims sometimes had little or no limit?—They have no limit according to the interpretation put upon the Act by the valuers of Norfolk.

16,234. And very often these claims are not found substantiated by the facts?—Frequently.

16,235. Mostly made up through theory?—There are a great many of them which no doubt in theory may be right, but when you come to prove the damage that the tenant has done they very often fall through.

16,236. Now the tenant's claims are made up and substantiated generally by vouchers and receipts?—Yes.

16,237. For the landlord's claim they have nothing of the kind?—That is so.

Mr. C. S. Read.
13 Apr. 1894.

16,238. So that the tenant before he makes up his claim must show what he has spent as far as cakes and manures have gone on the farm; he must show the vouchers to substantiate his claim, along with an analysis, according to the new law, of the quality of the material that he has used?—He must.

16,239. Then you have put before us and very strongly commented upon this point that the landlord's and tenant's claims should be made on the same date?—Certainly.

16,240. There is no reason why the landlord can claim a longer time for making out that deterioration of his land, because both he and his land agent should be thoroughly acquainted with the workings of the farm?—I think that the landlord one month before the expiration of the tenancy ought to know all about the condition of the land.

16,241. But if he even made it at the expiry of the tenancy it would suit the outgoing tenant, and it would suit the landlord as well, would it not?—No, I think this; I think it ought to be made one month before in order to enable the tenant, if he saw, for instance, a gate was taken off its hinges, or a ditch was not cleaned out, or one bit of a field had some foul grass in it, during that month to put those small matters right, and therefore I should certainly have it one month before the expiration of the tenancy.

16,242. Both for the landlord and the tenant?—Both for the landlord and the tenant

16,243. And if the landlord saw any other thing going wrong in the steading or buildings he might amend his claim?—And claim for it too, 14 days after. I think that is only just because some people are very careless in removing fixtures and do an infinity of harm to the buildings and the house by knocking it about.

Claims by tenants for compensation.

16,244. Regarding the articles that the tenant is entitled to claim for, it is a difficult question, and it is a question that might be a little exaggerated by the claims for using the produce that is grown upon the farm?—Yes.

16,245. You said, and I think justly, that you would not allow any compensation for the corn that is used by horses?—That which is used by cart horses, but if a man grazed colts or had a large stock of shire horses, which were kept for breeding purposes only, I think in that case it might be allowed; but certainly not in the case of farm horses.

16,246. You would allow a claim for all the corn that has been used for cattle or sheep or other animals on the farm?—I would.

16,247. What check would you put on the outgoing tenant in order to prevent him from exaggerating his claim; would you carry out the principle that he should when he used corn make the landlord or his land agent aware that he is going to do such a thing, or would you let him have a free hand to make his claim out as he does?—I would let him have a free hand to make his claim as he does. Generally speaking, as a matter of course, all corn is given in the shape of meal. In all probability he would send it to the mill and he would have a record there, and if he ground it at home I would make him keep a record there of every sack of corn that was grown, and I would also make him keep a corn book so that you could see what became of the produce of his farm.

16,248. I can see the justice of getting compensation for it, but I think the landlord is entitled also to see that it has been really used upon the farm?—Quite so.

16,249. Through meal for cattle and the consumption of corn by sheep and pigs?—I think that he ought to be well protected from fraud; it is a difficult matter, but it is not more difficult to my mind than taking it off one farm and putting it on to another as we do now.

16,250. What I am wanting to be at is to protect the landlord from fraud in the matter?—Quite so.

16,251. There is the open door, I grant it that an unscrupulous tenant may claim more than what has been used?—He may, and I do not doubt that he would in some cases, but you must be sharp enough to see that he substantiates his claim.

16,252. What I want to get at is this, what check you consider to be safe and sound to let the machinery run honestly and sweetly along?—I have said that he ought to keep a record of it, and prove it by his men or by his tradesmen.

Mr. C. S. Read. Apr. 1894.

16,253. In a general way farmers are not the very best bookkeepers, are they?—Certainly not.

16,254. But, perhaps, if there is any money to be got out of it, they would pay more attention to it?—Perhaps they might.

16,255. Without they could show by *bonâ fide* evidence this using of grain on the farm, it could not be substantiated as evidence?—I would give every check that was possible.

16,256. I think you say that you would like to see in the new schedules to this Act if it was improved, which I hope it soon will be, allowance for increased fertility and cleanliness and good cultivation as well as allowance for laying down grass for old pasture?—Yes.

16,257. Just now it is virtually upon the schedules that the tenant must rely?—Yes.

16,258. Increased fertility has never yet been taken into account in England?—That is so.

16,259. In Scotland I think you quoted a case, it was the Corshope case, was it not?—I think that was so.

16,260. That was a very marked case where the gentleman nearly doubled the value of the grassland by a large use of cakes and manures on pasture?—Yes.

16,261. The arbiter, recognised, for the first time I think it was, that allowance should be made for increased fertility, in a direction which is much required in England just now when the cultivation of arable land is not paying, and the land is being put down to grass; and I understand you would go the length of including increased fertility and the making of old pasture, among the things for which the out-going tenant should receive compensation?—I would.

16,262. Indeed, you want the out-going tenant to be fully paid compensation for the value he has left on the farm?—Yes.

16,263. That is your doctrine?—That is my doctrine. I do not at all go in for the three F's.

16,264. Then regarding the claim and the payment that should rest between the outgoing tenant and the landlord?—Certainly, the incoming tenant ought not to have anything to do with it.

16,265. You know it is sometimes put upon the shoulders of the incoming tenant, they say it is an arrangement and a bargain; but do you not think that when an incoming tenant goes to take a farm and values it according to the increased fertility made by the outgoing tenant if he pays rent upon it, and is called upon again to pay compensation, and it gets into the landlord's pockets does he not doubly pay it?—The tenant would be a precious fool if he does it.

16,266. (*Viscount Cobham.*) Does he not take into consideration the amount that he has to pay?—He ought to.

16,267. (*Mr. Clay.*) You consider that the landlord and the outgoing tenant are the two contracting parties?—I think that is so by the Act.

16,268. Yes, but what I am wanting to be at is this: you have often seen it put upon the incoming tenant's shoulders, the landlord turns his claims as obligations over to him, and he accepts them; and I think that is unfair; what do you say?—If the incoming tenant does that with his eyes open, I do not know that we have any reason to object; he certainly should not be so stupid as to pay an advanced rent in consequence of the improvements, and pay for those improvements himself, and therefore the Act very rightly says that the compensation should be paid to the outgoing tenant by the landlord.

16,269. So the two contracting parties are virtually the landlord and the outgoing tenant?—Yes.

The law of distress.

16,270. You also gave slight evidence upon the law of distraint; you said that it was perhaps beneficial to the farmer?—I think it is beneficial to the small farmer, the needy farmer, especially at this juncture; I think it would be a very great misfortune for it to be repealed just now, because the indulgence that landlords have given tenants I do not think many people are aware of.

16,271. You said that it extended 12 months?—Yes; to 12 months' rent.

16,272. Would you have any objection to see it the same as the law of hypothec in Scotland, reduced to six months?—I have no particular objection; I have no strong opinion about it one way or the other. I think it acts very well now, and I do not think at the present juncture I should like to see it altered.

Mr. C. S. Read. 13 Apr. 1894.

16,273. It acts, you say, well for the tenant, but how does it act for the trader who risks his capital in finding material, cakes, and seeds, and all these things for the farm?—It is against him, no doubt, and if I was a trader, I should go in for the abolition of the law of distraint, no doubt. Some people say, you know, that the bankers suffer by it. I have never known bankers suffering very much from farmers, they generally take precious good care either to be secured or else guaranteed, and when a man is bankrupt, they come before the Bankruptcy Court, and anybody would think that they were the most generous people in the world. They take the dividend, and then if they have not got enough of the dividend, they proceed against the guarantors; they invariably get the whole of their money.

16,274. Is it not the case that the trader, knowing that he has an unsound security for his principal and the interest, punishes the farmer by laying on an excessive rate for his goods to cover that?—I dare say he does. I suppose he can take care of himself fairly well.

16,275. And the tenant is benefited by it on the one hand, but is he not smarting on pretty hard lines of business on the other?—If he has got cash he can go and get his goods a good deal cheaper than he can on credit.

16,276. How many farmers in Norfolk now have cash compared with what used to be the case?—Not so many; but a good many of the best business men still pay cash.

16,277. But these cash men do not require any protection. I am looking at the farmer who does not pay cash?—I cannot see that the law of distress is against him—not the small and needy farmer.

16,278. Does the landlord not get a pretty considerable interest for his 12 months credit in the shape of rent from the tenant?—I do not quite follow you.

16,279. Does not the landlord giving the tenant 12 months credit get a pretty sharp 10 per cent. extra for the obligation of being delayed in the payment of rent?—I should say not. I do not see that he would.

16,280. Does a credit buyer get an article at the same price as a ready money buyer?—The law of distraint I believe prevails over every civilised country in the world except Denmark, and if you go to Denmark I think you will find that all the rents there are prepaid; that would not suit the farmers here I know.

16,281. Does not the law of distraint very often encourage the tenant to take up more land than he should take?—Perhaps it does.

16,282. That is not a very wholesome business?—No, I say I have no decided opinion about it, but I believe at the present juncture it is very favourable to the poor struggling tenant, and I should be very sorry to see it altered just now.

Sale by live-weight.

16,283. I will take you to a more genial subject. You know about the weighing of cattle, you have said something upon it?—Yes.

16,284. You have had a good deal of experience in America?—I saw it there, and I was very much charmed with it.

16,285. Would you like to see selling by weight and buying by weight established in England?—Yes, I should very much.

16,286. Would it be very beneficial and profitable to the tenant farmer?—Yes, I believe it would, because he is now pitted against dealers and butchers who must be better judges than he is.

16,287. It is their daily occupation, and it is perhaps the monthly occupation for a farmer to sell sheep and cattle by sight?—Yes, it is so.

16,288. You see that the Americans selling by weight over the scales as you have seen in Chicago, and other places, is the true principle of the tenant getting all that is in his cattle, and all that is in his sheep out of them?—I think it is the best plan, and I am quite sure of that in America in the wholesale way in which they deal; they could not get through the business unless they had some scheme of that sort. We have more time on our hands, and I suppose we are more fond of higgling and bargaining than most people, and, therefore, most farmers seem to prefer the old system. But I have

Mr. C. S. Read. 13 Apr. 1894.

bought cattle for stores and I have also sold fat cattle, and it is a very great advantage to me, because having been comparatively away from my farm for so many years, I do not pretend to know the weight of a bullock now as I did when I was 25 or 30 years old.

16,289. The very idea of the butchers and the jobbers objecting to pay by weight shows that it is for their benefit, and so that it is for the disadvantage of the tenant farmers to sell in that way?—Quite so.

16,290. So that if a tenant farmer could sell by weight he would be upsides with both the jobber and the dealer?—He would be put on a level with them.

16,291. Indeed he would get all the market value of the weight of the animal that is in it?—I think he would in some cases. Of course that is not the whole of the bargain, you must consider the quality of the meat.

16,292. The price in America is made by the quality, the grades is it not?—I would not follow the Americans so far as that, I think a farmer knows very well whether his bullock is half fat or fat; he knows very well whether it is the best quality of meat or not, he is just as good a judge of that, I think, as the man who buys it.

16,293. But the price in America, you know, is made by so many dollars and cents for the 100 pounds of live weight?—Yes, but then you grade your cattle there just the same as you do your wheat. I believe there are one, two, or three grades, and somebody else tells you which grade it is in, does he not?

16,294. No, the salesman tells you that he sells them at so much per 100 lbs., it may be 5 dollars, it may be 3 dollars, it is sold upon the value of the grades. It is the same here. You have prime beef in London which is perhaps bought at 5*s.*, and second class at 4*s.*; and when you come down to the third class it is 3*s.* the live weight of 8 lbs.?—I think the farmer is quite as good a judge about the quality of the meat as the butcher would be, and I do not think that selling by weight would help him much in that particular.

16,295. But still he would get increased value for increased quality?—I think he does that now.

16,296. Yes, but even as to weight, it is the weight I am wanting to get at. You consider it would be more beneficial for the tenant that feeds his cattle to sell by live weight than by the present system?—Most decidedly.

Cattle diseases.

16,297. (*Mr. Chaplin.*) I think you said that on one point the two bodies whom you represent, as well as yourself the Norfolk Chamber of Agriculture, and the Farmers' Club, differ, and that is about the admission of Canadian cattle into the interior?—Yes, Canadian healthy store stock.

16,928. You have suffered in the past very greatly in Norfolk from pleuro-pneumonia, I think?—We have considerably, and it almost all came from Ireland.

16,299. You would be very sorry to see it back again?—We should indeed. We do not dread that so much as we do "foot and mouth."

16,300. When you say that the Norfolk Chamber are in favour of the readmission of these Canadian store stock, I suppose that is only if it can be done without any risk of bringing back pleuro-pneumonia?—Most decidedly.

16,301. You are acquainted, I am sure, with the two great peculiarities of the disease, that it cannot be detected very often in the living animal, and that the period of incubation is very often a very long time?—Some months.

16,302. Are you aware that the Board of Agriculture in correspondence with the Canadian Government the other day pointed out that cases had been known of the development of the disease after no less a period than 15 months?—No, I did not know that, but I can very well understand how that occurs. An animal that has had an attack of pleuro-pneumonia may recover from it, and one of the cysts of the lungs may continue there for some months and by some accident or another burst, and although that animal may be perfectly well itself, it may be the means of communicating the disease to another.

16,303. Yes, quite so; but are you aware that in the autumn of 1892 three undoubted cases of pleuro-pneumonia were discovered among a cargo or cargoes of Canadian cattle landed in Scotland?—I have understood that there were three cattle.

16,304. And these animals and that cargo were distributed to no less than 70 different places in Scotland, did you know that?—I did at the time but I have forgotten it.

Mr. C. S. Read. 13 Apr. 1894.

16,305. Are you aware what the cost of getting rid of the importation of that cargo was?—No.

16,306. You are not aware that 13,000*l.* had to be paid in compensation?—No.

16,307. Do you know again that the Board of Agriculture instituted a systematic examination for some period of the lungs of all the Canadian cattle that were landed in this country after that outbreak?—Yes.

16,308. Are you also aware that three undoubted cases of pleuro-pneumonia were found in the months of May and June last year?—I do not know whether they were undoubted. It took a very long time to decide whether they were pleuro-pneumonia or not, I think something like three weeks.

16,309. It took more than that because every opportunity, I believe, was given to the Canadians and they were subjected at last to microscopic examination, but are you not aware of this that the Board intimated to Canada their opinion that they were undoubted cases?—Yes, I think they did after a very long time of examination.

16,310. Being aware of all those facts and also of the fact that the period of incubation may be so very long would you be in favour of the re-admission at the present time of Canadian store stock?—If the Board of Agriculture could assure itself of the health of the Canadian cattle I should say they might come. It is so entirely different from Europe; the whole of Europe is more or less dangerous—must always be and the live cattle ought to be absolutely excluded. But with regard to Canada in the first place it is a part of the Queen's dominions and we can rely upon their honesty I think a good deal more than we can upon some of the foreign Governments, and I am not aware of any transit of cattle through their Dominion unless they happen to smuggle in something across the borders of the United States. That is the only danger that I can see.

16,311. You are aware of course that there is still a great amount of that disease in the United States and that numerous cases from the United States have been detected in the last 12 months?—I think that the Eastern States of America are more or less subject to pleuro-pneumonia and I fancy they always will be when they have those huge town dairies.

16,312. Are you not of opinion that considering the enormous length of frontier between the United States and Canada there must be always considerable danger of animals being smuggled across the frontier contrary to law?—I think there is a danger, but the Canadians do not like the Yankees and *vice versâ*, I believe. I do not think there is so much danger as someone might imagine in consequence of the length of the boundary.

16,313. Your general view then I take it to be this, that although you would be in favour of the readmission of Canadian stores, if it can be done with an assurance of safety, unless that is possible you would rather things remain as they were?—Certainly.

The depression in Norfolk.

16,314. Your description of the state of Norfolk leads us to believe that the agricultural condition is deplorable there, that is so, is it not?—It is so, in common, I think, with almost all other arable districts of East Anglia.

16,315. As to the landlords, you say that they have lost at least half their income. Are many of them obliged to give up living at their homes?—I should think that taking the county of Norfolk through, two out of three of our country gentlemen do not live in their homes.

16,316. In consequence of their diminished incomes?—Certainly.

16,317. That in itself, I assume, you would regard as a very great evil and misfortune?—Very much so, because the shooting tenants who occupy the mansion only come down for a few months, and they do not take any particular interest in the neighbourhood.

16,318. The position of the tenants, except in the north-east of the county, you describe as one of absolute ruin and wholesale bankruptcy?—I would not say that applies to all tenants, but I say, taking a general view of the case with these three bad seasons, and the unpre-

Mr. C. S. Read.
13 Apr. 1894.

cedentedly low price of agricultural produce, that is their condition.

16,319. That being the position of the landlords and the tenant farmers, I understand you that the yeomen and freeholders are even worse?—I believe so.

16,320. And that they are fast disappearing?—Yes, there have been more bankruptcies and assignments among the yeomanry in proportion to the tenantry.

16,321. And this is so, although in the case of the yeomen and the freeholders they enjoy, of course, the fullest security for their outlay that any law could give them?—Yes, but they have also the whole of the burdens, both of the landlord and of the tenant to bear.

16,322. That being the case with the freeholders, it points, I apprehend, rather to this, that neither the "three F's" which are often suggested nor any amendment of the Agricultural Holdings Act, however desirable they may be, can be regarded as a remedy for this state of things?—Certainly not with the yeomanry or with the freeholder.

16,323. And with regard to the tenants?—I do not think if you had the best Agricultural Holdings Act that was applied anywhere that it would be of any use to the tenants to save them from ruin now.

Reduction of rent.

16,324. As to the question of rent the reductions have already been considerable?—Yes.

16,325. Can you say what proportion of the rent which is left on an arable farm would represent the whole outgoing of that farm?—About one-sixth. Might I just say one word in reference to that. A large farmer close by Norwich told me this only last Saturday: he said, "When I begun farming my rent was "twice my labour bill, now my labour bill is twice my "rent."

16,326. That answers the question that I was going to ask you; how does your rent compare with your labour bill?—That is a remarkable instance, but my rent was never very high, and I apprehend this man's was at one time. My labour bill is 50 per cent. more than the rent and tithes and rates.

16,327. Then, of course, you have very large outlays on the purchase of manures and cake and other expenses?—Yes.

16,328. We may take it that the rent is about one-sixth of the total outlay?—On a light land arable farm I think it is so.

16,329. I remember that on the occasion of the great agricultural meeting at St. James's Hall, you gave some very interesting information, which I am rather anxious to elicit before this Commission. You told us then what was the difference between the wheat and the barley crops alone in Norfolk, in the value of those crops taking the year 1891 and the year 1874. Do you remember what that was; you estimated it, I think, at something like two millions?—I am the worst hand possible at remembering figures. I hate them to begin with; therefore they do not stick long with me, but I do not doubt that what I said was about true. It is worse now.

16,330. "Contrast 1891 with 1874 our last good and "best agricultural year, and what do we find? Taking "wheat and barley alone in the county of Norfolk, we "farmers have lost absolutely from that date, com-"paring the two years, two million pounds"?—If I said it then I say it again.

16,331. Then you put the acreage of Norfolk at, in round numbers, a million?—Yes.

16,332. And you put the rental at 1*l.* an acre in round numbers all round?—Yes.

16,333. And showed that in that way, in two articles of production alone, double the amount of rent had been lost?—Yes, I can remember that fact.

16,334. And that you would state now to the Commission equally?—Yes, I would.

16,335. Only that it is worse?—It is rather worse; this last year it is worse certainly.

16,336. Then, as a matter of fact, the rent is a very small item in the present condition of the agricultural interest in Norfolk; it is not a material cause of the depression?—Most decidedly not. I am speaking of course now of arable land.

16,337. I am speaking also of arable land. You also stated to the Commission in your first examination that unless six rents could be made by a farmer on an arable farm in Norfolk, you maintain that he could not get a living?—I think not.

Mr. C. S. Read.
13 Apr. 1894.

16,338. What I am asking these questions for is to elicit from you whether it is your opinion that no further reductions of rent in the county of Norfolk could be regarded as a sufficient remedy for agricultural depression?—No, certainly not. I think the rents must be further reduced, but unless something else happens in addition to that, an improvement in prices say, I do not think that reductions would save us.

16,339. Further reductions of rent must be made, but those will not be a remedy for agricultural depression or save the farmers, if the present state of things continues in other respects?—Certainly not.

Fall in prices.

16,340. Now upon the question of prices has it been your experience that the fall in prices during the last few years has been more or less continuous?—Yes, I think it has. With regard to wheat, it seems to me as if there was no bottom to the depression.

16,341. Do you share what was a very general opinion when wheat fell to 30*s.* last year, that at that time we must have touched bottom?—I thought so when it was 40*s.*

16,342. Now I think I am right in saying it is about 24*s.*?—24*s.* 5*d.*, I think, is the price.

16,343. Then the drift of your evidence, in fact, to a great extent, I take to be this: that the real cause which lies at the root of the present agricultural depression is the great and continuous fall in prices, and that there can be no effectual remedy unless there is some improvement in those prices, or at all events, unless the continuous fall is arrested?—I would add the bad seasons please to that. We have had three exceptionally bad seasons; in fact we have not had a really good corn crop, and root crop, and hay crop that I can remember since the year 1874; something has always been amiss.

16,344. But with good seasons during the last three years and the present prices, would agriculture have been, in your opinion, perfectly prosperous?—Certainly not flourishing, but we should not have been as badly off as we are.

16,345. That is to say that the effect of these extremely low prices has been aggravated to some extent by the bad seasons?—It has, no doubt, especially this last season in the county of Norfolk.

Small holdings

16,346. Have you ever turned your attention to the question of small holdings and to the possibility of reducing the size of farms?—Yes.

16,347. Would you state your views upon those subjects to the Commission?—It depends where you are, but if you are in a large light land county like Norfolk, which is almost all under the plough, I do not think that small holdings are a great advantage. There ought to be a few small holdings in every parish, not so much for the benefit of the labourers as for the benefit of the traders. They want a little bit of land and they generally farm it fairly well. But with regard to the *bonâ fide* small farmer in the arable districts, I say that the only way in which he can possibly succeed is this: in doing the work of two agricultural labourers and living at the expense of one. That is the only chance that he has, and I say this: that as far as regards his family they are worse educated and harder worked than the children of the agricultural labourer. I should say also generally that when people imagine that those men who rise from being agricultural labourers rise by the simple hard work of the farm, that is very seldom the case. The man who really rises with us is this sort of a fellow: he is a sharp lad; perhaps he keeps rabbits or poultry; he gets a little money together, and he buys a pig and afterwards perhaps he may start a pony-cart. Then he becomes what we may call a pig jobber, then perhaps his wife will keep a shop. They might kill a pig in the week and retail it out. Then he would perhaps buy a few sheep, and then possibly cattle, and then he would want a bit of land, and then he would go on from one field to another. I could put my hand upon dozens of men I might say that come on to Norwich Hill who have risen in that way to be large farmers or great cattle dealers; but at the same time I could not put my hand upon half a dozen small men who had risen simply by farming a bit of land.

16,348. Where the occupation of small holdings is combined with some trade, some other business, in the

Mr. C. S. Read. 13 Apr. 1894.

villages or small towns, there you think it may often be found to answer?—Yes, and in addition to that, where there is a lot of good grass land, and a man can keep his cow and all that sort of thing, very small holdings are not only very necessary I think, but I believe they are fairly profitable. Where a man can sell milk there I think he has a chance of getting a fair living. But where you come to simply arable land I do not think any man ought to have a small farm under 50 acres, because he must keep a couple of horses to do his work and that requires a considerable amount of capital, which very few labourers possess.

16,349. Were it in a country where it would be possible you would think it very desirable that a labouring man should have an opportunity of keeping a cow, if it could be arranged?—There is a great difficulty in keeping cows on arable land There are many farmers in Norfolk who do not keep a single cow.

16,350. Yes, but I say in a county where it is feasible, where there is more grass?—By all means, certainly.

16,351. You advocate that strongly?—Very much so.

Protection.

16,352. You told us that you attribute the fall in prices mainly to foreign competition, but at the same time you do not advocate protection; but did I understand you to say that you would like to see import duties for the purposes of revenue?—Yes, I say so, but I do not suppose that that is an opinion which would find favour with many outside the agricultural interest. But if you were to poll the Norfolk farmers, I should think they would be 9 out of 10 in favour of protection.

16,353. The great majority of the Norfolk farmers, I apprehend, would be bolder than you?—Yes.

16,354. And they would go for protection outright?—They would, no doubt.

Wheat growing in America.

16,355. Although you consider foreign competition so injurious, I think you told us that the American growers of wheat were almost as much ruined as the wheat grower in England; there were some reasons for believing that we had seen the worst of American competition?—I think you have had my friend, Mr. John Clay, junior, here before you, who has said as much as that, and also from my friends in America I hear the same tale, that in the Eastern States particularly, the farmers are just as badly off as we are.

16,356. It is also the case, I think, that you stated that the American acreage of wheat was less?—Yes.

16,357. And the population of America very much greater than it was some years ago, and yet concurrently with this the price of wheat is lower than ever?—It is lower than ever.

16,358. That was the view you put before the Commission?—Yes that is the view I put before the Commission.

The currency.

16,359. Has this state of things ever led you to consider whether the fall in price can be due to some other cause—a cause connected for instance with the currency?—Yes, although that is a point that I should not like to offer an opinion upon, but I am very strong on that subject. My own experience and the history of our agriculture during this century shows that the currency has a great deal to do with the prosperity of agriculture. If I might be allowed to state it, my father went into business in 1820 and he told me that he was half ruined by the withdrawal of the 1*l.* notes. I think that came about in 1821 or something of the sort. In 1822 prices were ruinously low. Then I think they restored the 1*l.* note for a few years and agriculture flourished again until I think about the thirties; then they withdrew them altogether and there was a period of agricultural distress. I am quite old enough to remember the early days of free trade, and about the years 1850 to 1852 we were very nearly as badly off as we are now. Then all of a sudden there was the most extraordinary discovery of gold I suppose that the world has ever known and about 1853 prices went up and we prospered for a long time. Then there were all sorts of wars which I daresay helped, which I hope to God will not occur again, but in the year 1873 I believe there was an alteration in the currency in other lands and a withdrawal of silver and from the year 1874 there has been a gradual diminution I believe of prices, that is to say the people who have had money have done fairly well, but people who have employed labour and who have been engaged in the production of manufactures have fared rather badly. I will not say anything about the Indian rupee but I read in the "Times" the other day a most extraordinary statement about what they call the Wheat King of the Argentine Republic. I daresay you have had that before the Commission. It was a remarkable article upon a Mr. Guazone.

Mr. C. S. Read. 13 Apr. 1894.

16,360. (*Mr. Everett.*) Can you tell us what date that was in the "Times"?—I think this last February. He was an Italian gentleman, he had 66,000 acres of wheat; he hired 3,500 railway trucks to take this wheat of his to Buenos Ayres and he sold it at 80 dollars a ton. If he took seven tons in a truck that would give his produce at something like 13 bushels per acre or about 110,000 quarters. Taking the price that he made of it in the currency of the Argentine Republic he got over 70*s.* a quarter for his wheat; but paid in gold, I believe it was, about 18*s.* a quarter, so, of course, they can send it here to London and sell at a profit at 25*s.* a quarter.

16,361. (*Mr. Chaplin.*) And in that way depress the price of wheat everywhere else?—There is every reason that he should grow rich and I should grow poor, I apprehend, if that is true.

16,362. At all events you appear to be strongly of opinion that the great fall in prices from which we are suffering now is due to some general contraction of the currency of the world, and that an expansion of that currency might put a very different complexion upon the position?—I think it would. From what I have read in history it has always been the case that when there has been plenty of money people can prosper.

16,363. You are aware that a party in the country are now advocating the readoption of the bi-metallic system as very likely to improve the agricultural situation?—Yes. I do not pretend to understand that. I do not think anybody can; at least, I know no two people who seem exactly in accord upon it, but at the same time I think something of that sort would be very desirable. Even if I were made Chancellor of the Exchequer to-morrow I would issue £1 notes for the time being and put silver against it. I think that would help.

16,364. However, if this system which you find so difficult to understand, was to have the effect of arresting the continuous fall in prices from which we are suffering so much at present, and possibly even of giving prices an upward tendency, if it had that effect, that you would regard as a real and substantial move in the direction of a remedy for agricultural depression?—Yes, I should, because I believe that is brought about by unfair means. If it was a legitimate transaction between different countries I should not object to it so much, but I apprehend this—if you have a market that is full, and you have this cheap commodity only to the extent of 10 per cent. more than is required, that 10 per cent. reduces the whole of the value of the other stock 20 per cent.; and that is the case I believe with these silver depreciated countries sending wheat to us.

16,365. I do not ask you any questions as to how, in your opinion, the establishment of any such system should be attempted, because I understand you to say you have not studied it sufficiently to express an opinion?—I know nothing about it whatever.

The Agricultural Holdings Act.

16,366. Now with regard to the Agricultural Holdings Act, I want to ask you a few questions. You do not altogether disapprove of the Act itself?—Not at all.

16,367. It is more of the administration of the Act that you complain?—Yes, in my own district, I will not go outside that. We say that whereas I think we in Norfolk have not one per cent. that comes under the Act when there is a change of tenancy. "Bell's Weekly Messenger" had a return from the whole of England, in which they put it only at five per cent.

16,368. You have suggested several amendments, about which I will ask you some questions directly, which you think will be advantageous, but I do not understand you to say that supposing all of them were adopted that you contend as indeed you said just now that that would be a remedy for the depression?—No, because although some farmers in some districts may think of leaving farms we never give a thought of that until we cannot go on any longer.

16,369. Your object is to stay in your farm?—Certainly.

16,370. And as long as you stay in the farm no alteration in the laws which provide compensation for leaving would have any effect upon you?—Not any.

16,371. Now as to your suggestions, they were seven or eight, I think, in number?—Yes.

Landlords' claims.

16,372. You stated that the landlord's claim for dilapidations should be limited, I think, to the list of the dilapidations which were to be scheduled; is that what I understood?—Yes.

16,373. What dilapidations is that proposed schedule to contain; could you give us the particulars?—No, I could not; but they are very ample.

16,374. They embrace everything?—They embrace almost everything, I think.

16,375. But you are not prepared to put them before the Commission now?—No, we have agreed upon them in the Central Chamber Committee, but as you very justly said——

16,376. Provisionally?—Provisionally agreed to them, but there will be no opposition I apprehend to that schedule.

Claims and counter-claims.

16,377. Then your second suggestion was that the landlord's notice of claim for counter compensation should be given on the same day as the tenant's, except for buildings?—Yes.

16,378. Upon that I want to ask you this question; is there any real necessity for any notice of claim at all upon either side; would it not be sufficient to say up to a certain fixed time either party may claim whenever he likes?—I think that it is well that a claim should be made on both sides, so that you may know what you will have to pay or what to receive.

16,379. For instance, there are many things for which a tenant, as a matter of course, must receive compensation, or ought to receive compensation on quitting a farm; why should he be compelled to give any notice of that claim?—Because one is so obvious; you can see a haystack and a field of roots, and a heap of manure, but you cannot see the unexhausted value of your feeding stuffs and manures in the land, and therefore you ought to be prepared to say what you claim and give proof of it.

16,380. You are acquainted with some of the customs which prevail in other counties than Norfolk I know?—Yes, I am.

16,381. For instance, you are acquainted with the Lincolnshire custom more or less, I think?—Yes.

16,382. It is the case there that no notice of claim is ever required, is it not?—I believe that it is so common and so old a custom that you do not give a notice that I am aware of.

16,383. If a practice works without any friction or difficulty in the case of an old established custom is there any necessity for making your law upon a different basis in the case of an Act of Parliament?—Yes, I think there is; a custom is a thing that everybody understands, and that the majority of people agree to; an Act of Parliament is totally different in its operation.

16,384. Then you mean to say that unless a tenant gave a notice that he was going to claim by a certain day within a certain time, which you would lay down in the Act of Parliament, if he neglected that he would not be allowed compensation at all?—I should think it would be rather sharp practice if he had forgotten to give it on the day, but at the same time I should expect him to give a notice.

16,385. But surely if you make a condition and enact it by Act of Parliament he must conform to it or not?—Yes, of course he must, but I do not think you want to be so exact as they are with us, when they say that eight weeks are not two months, and that sort of thing.

16,386. Then if you are not to be so exact, does it not rather come to this, that the view which I entertain myself that notice is not required may not be very far from right?—I think the landlord should know what the tenant claims. As to the precise day I do not know that it signifies quite so much.

16,387. However, you think there ought to be a notice given?—I do.

16,388. At present I confess I have not elicited any very strong reason for it?—Of course it is so new with us you see, and it is so old with you that you do not require a notice.

Scheduling the condition of farms.

16,389. Now you told us in the third place that there ought to be, you considered, a record of the condition of the farm upon entry?—Yes.

16,390. Would you explain how that is to be carried out, who is to make the record?—The two valuers who value the farm on going in. I do not know whether it is the custom with you, but we always have the outgoing and incoming tenant appoint the valuers; they go round and see every field, and their report could put on the valuation.

16,391. Is this record to be compulsory?—I think so.

16,392. By whom is it to be kept?—The landlord would get the copy of the one, I suppose, the tenant of the other.

16,393. Would you not have one copy filed in some public department?—I think not. I think the landlord generally has an agent who would take care of it for him.

16,394. Is every field to be specified?—I do not think that is necessary, but they might make a few general observations on the condition that the land was, either foul or clean or in a high state of cultivation, or that it was impoverished.

16,395. I wanted to go a little bit further than that. You would say there are to be different grades of condition then; what is the form of the record to be; is it to be a general form or is it to be entirely at the option of the valuers?—I think it might be left to the option of the valuers to say whether the farm was in good or bad condition at the time of the entry.

16,396. I am trying to elicit information, because I think it is a very good proposal myself, and I should like to hear from a practical man exactly how it should be carried out. Is it to be limited to "good" or "bad"?—If I might suggest it, I think the gentleman who is coming after me, who knows ten times more about valuations than I do, would be a better judge and give you a more decided and valuable opinion than I could possibly do. But my idea generally is this, you have this valuation which says that for the roots and hay and for the compensation, so much; and then you might in a very few words describe the general condition of the farm, and that I think would be ample.

16,397. But the plan has not been at present, in the Committee that you speak of, thoroughly threshed out I suppose?—They have not scheduled it or anything of that sort.

Payment of compensation.

16,398. Then it is proposed that continuous high farming with good and clean cultivation should be scheduled for compensation; is that to be in lieu of compensation for outlay on improvements, the benefit of which the tenant loses on leaving, and for which he gets or ought to get now, a full compensation, or is it to be in addition to it?—It is an addition to it, because you cannot go back under this Act for more than two years for your artificial manures and your feeding stuffs except in the case of bones I think; and generally speaking that is quite long enough on arable land but on pasture land which has been well grazed with cake and corn for a good many years I think there ought to be something paid for that independently of the last two years.

16,399. Then if it is to be in addition to compensation for improvements I want to ask two more questions and the first is this: Is it not implied even if it is not actually expressed in almost every agreement that is made for entering upon a farm, that the tenant is to farm his occupation well and to keep it in good and clean cultivation?—Yes.

16,400. If that is so why is he to be compensated for only doing what he has expressly agreed to do?—Because you very often have continuous high farming which is quite a different thing from the ordinary acceptation of clean and usually good husbandry. I think that the man ought to be compensated for that in the same way that a man ought to be fined if he leaves his farm foul and poor.

16,401. Then it is for high farming as such rather that you make this suggestion than for ordinary good clean cultivation?—Except this: that if a man takes a farm very much out of condition and leaves it in good condition, I think that ought to be an element for compensation provided that he has not been remunerated by a reduced rent.

16,402. But is it not the case that the tenant where he has farmed it well, and exceptionally well, gets compensation by the increased produce and profits which naturally arise from a farm in good condition as long as he occupies it; does he not go on getting compensation all that time?—Yes, he gets some but he leaves some too.

Mr. C. S. Read.
13 Apr. 1894.

16,403. Then, if I understand the proposal aright, it comes to something like this: the tenant is to get compensation first, by the increased profits while he is in the occupation of the farm; secondly, he is to get compensation for the unexhausted outlay which he leaves in the farm; and thirdly, he is to get compensation for carrying out his agreement to farm well?—No, not under the ordinary acceptation of the terms; "continuous high farming," I believe, is what we propose.

16,404. Would you give us the words again, because this is rather an important question?—I think it is "continuous high farming with good and clean culti-"vation to be scheduled with compensation;" that is to say, you may have a man who would farm his land very highly, and yet at the same time, keep it quite foul. There are such instances, and he would get no compensation, but if he did both he would.

16,405. Let me understand a little more; would he get compensation for good and clean cultivation without high farming; according to your proposal, is that your view? You may actually have good and clean cultivation without any exceptionally high farming?—Yes.

16,406. Would he have to be compensated for that good and clean cultivation?—Not unless he could prove that the farm when he took it was in a very bad state of cultivation, and foul.

16,407. And then if he was charged any less rent because of its being unclean and foul, he would not be compensated?—Certainly not, he would get his compensation there.

16,408. The amount of this new compensation, I think you said, was to be left entirely to the valuer?—I think so.

16,409. Is there to be no limit to it, no principle by which the valuer is to be guided in awarding it?—I should leave it to the valuer, as we must a great many other things.

16,410. But surely it is not left entirely to the valuer. The amount of compensation is usually either on the basis of outlay, or upon the value to the incoming tenant; is that not so?—Well, we will take it at the value to the incoming tenant; if he can prove that he has enhanced the value to the incoming tenant, that should be the basis of the improvement; if he had spent the money injudiciously, and had not improved the land, he would not get any compensation at all for it.

16,411. So far then you would give the valuer this guiding principle, that the compensation is to be paid on the basis of the value to the incoming tenant?—That is the basis now I think of all the improvements.

16,412. That is in the Act itself?—Yes.

16,413. And you propose that this compensation should be treated in the same way as the others?—Just so.

16,414. There it seems to me there is a difficulty. Will not the value to the incoming tenant depend entirely on the rent that he is to pay for it?—Yes, but the landlord is to pay this I apprehend, not the incoming tenant.

16,415. Yes, but if the value depends to the incoming tenant entirely upon the rent, as it appears to me that it would do, I do not see how the valuer is to make his estimate without taking the rent into account; and I think you said in your first examination that any interference with rent was entirely outside of your views?—Of course. It has nothing to do with the rent that the incoming tenant pays. I apprehend that the landlord would get as much as he possibly could, and if a portion of the increased rent was due to what the tenant had left there, I think that it should be paid for.

16,416. Then that practically would mean the valuation of the rent by the valuer which is precisely what I understood you to say you deprecated?—I did not say that. The landlord takes these improvements upon himself and has to pay the compensation. The tenant pays a higher rent in consequence of these improvements. He can make what bargain he likes with the landlord.

16,417. Quite so, but then I understand the valuer is to estimate how much this continuous high farming has added to the rent which the new tenant is enabled to pay, and he has to get compensation by deducting an equivalent amount or by calling upon the landlord to pay an equivalent amount?—I do not follow you there. I say again that the incoming tenant has nothing in the world to do with this; this is the compensation that the landlord pays to the outgoing tenant for having increased the value of his holding; and the next party that comes in has nothing to do with it I apprehend.

Mr. C. S. Read.
13 Apr. 1894.

16,418. I am not submitting to you that the next party has anything to do with it but what I am submitting to you is this, whether it is not tantamount to the valuer deducting so much from the rent because he calls upon the landlord to pay compensation to the outgoing tenant to the amount if I understand you by which the rent has been increased in consequence of this good farming?—It is the value of the "holding"—that is the word; I do not think "rent" comes in anywhere in the Act, and I do not see why it should apply to this clause more than to any other; it deals with the increased value of the holding as an agricultural holding.

16,419. Have you ever considered this in connexion with amendments of the Agricultural Holdings Act, that compensation must be based either on outlay or on the value to the incoming tenant; would it be advisable, in your opinion, so to amend the Agricultural Holdings Act that in future the compensation should be based upon the outlay rather than upon the value to the incoming man?—In the case of manures and feeding stuffs you must take into consideration the outlay. I do not think in the more permanent improvements that it is necessary to consider what the outlay was, because it might have been very injudiciously spent. It might have been extravagantly done and it might be an utter failure; and therefore I do not think that I should alter it in that case. In the case of manures you cannot do otherwise than consider the outlay.

16,420. You are aware that this is done, that the compensation is based upon outlay in the case of most of the customs?—Yes, but then they refer only to what we call quite temporary improvements.

16,421. Not in all cases, surely?—I thought they did, but I am not up in the tenant right of other parts of England.

16,422. You have no custom, I think you said, in the county of Norfolk?—Not an atom.

16,423. That is owing to the fact, is it not, that for a great number of years it was the practice until recently to let farms in Norfolk upon leases?—A good many of them are let upon leases.

16,424. That would account for no custom having grown up, probably?—Possibly.

16,425. But where there are full and elaborate customs, such as those which do exist in some parts of England with which I am personally acquainted, I was going to ask you this question if you had been able to answer it: is it not the case that a fixed proportion of the outlay on the several improvements is allowed, varying in accordance with the time they have been made, and by which everybody knows when he quits pretty nearly what he is going to get?—I think that is the case with draining, but I do not like that principle myself on which to pay even for draining, because it may have been very badly executed, or it may be in quite as good order at the end of 10 or 15 years as it was on the day that it was done, and it may be on some soils that do not want draining and are rather injured than benefited by draining.

16,426. If I remember right the first Agricultural Holdings Act was based upon that principle was it not?—I think it was.

16,427. Many years ago. I also remember that you introduced an Act of Parliament yourself in connexion, I think, with Mr. Howard?—Yes.

16,428. What principle was that based upon?—It is so long ago that I have forgotton, but I really think it was principally as you say on outlay.

16,429. On outlay?—Yes, you see that I am dead against giving any facilities for tenants doing landlords' work, and I consider that draining, and road making, and building, and all those sorts of improvements, ought to be done by the landlord. I do not care so much about how you are going to arrange that compensation; the compensation that I want for the tenant is for what he does himself in the cultivation, and in the maintenance of the fertility of the land—that is his proper business, and he ought to be compensated if he leaves any of

Mr. C. S. Read.

13 Apr. 1894.

those improvements behind him. The others I do not care very much about.

16,430. Even with regard to what I should call from your description, these minor improvements there, you would object to have the compensation paid on the basis of outlay?—You must take the outlay into consideration in the last two years I apprehend. Of course you cannot trace the benefit—that is impossible. Suppose a ton of manure is put on to a field; if it is put on a field in the month of March or in the month of November, it makes such a wonderful difference to it. You must take a general all round view of the fertility that has been imparted to the soil by the application of these manures and feeding stuffs.

16,431. Does it not rather come to this; that although the principle of the Act with regard to these minor improvements may be based nominally upon the value to the incoming tenant, as a matter of fact it must be estimated on the basis of the outlay?—In the case of these minor improvements certainly.

16,432. And with regard to the major improvements, your chief objection to compensation on the basis of outlay would be, I understand, because it gives facilities to the tenant to make improvements which ought properly to be made by the landlord?—Yes, and which, generally speaking, he would not be in a position to make as well as the landlord.

The schedules.

16,433. Then I will come to the next point. You propose to transfer some items in the first schedule in the existing Agricultural Holdings Act to the second schedule: could you say what items it is proposed to transfer?—Small market gardens not to exceed half an acre and laying down the land to grass. But you will have ample opportunities, if I might say so, of hearing this from the Secretary, say, of the Central Chamber when this is put before you, when the Committee have reported and it has been adopted by the Central Chamber.

16,434. I will do exactly what you like, but I was anxious to get your opinions, as a well-known practical man, before the Commission. Perhaps we had better postpone it; if you wish it, I will?—I would rather do so, because I have not the materials before me. I forget what they were, but they simply came to this: I think, generally speaking, to take some of the minor improvements out of the first schedule and to put them into the second.

Compensation for home-grown produce.

16,435. May I ask you one or two questions about the compensation for home-grown corn to supplement those that Mr. Clay has asked?—Yes, certainly; I do not object to anything.

16,436. I think you said in your principal examination that you would limit compensation for home-grown corn to what was consumed by the cart horses?—No, I would exclude the corn that is given to the cart horses from any compensation.

16,437. And why?—Because a great portion of the manure is not deposited on the land at all.

16,438. What becomes of it?—Horses go off to market and on the roads, and you do not have them constantly employed on the farm.

16,439. Then you would limit it to the corn consumed by the other stock upon the farm?—Yes, but I have stated that if a man grazes colts, or keeps a lot of breeding horses, I do not see why they should not be compensated for, because they do not go off the land.

16,440. Has not the great objection to compensation for home-grown corn always been this: that it is almost impossible to prevent fraud?—That is the reason and the only reason that I know of, and it is a very strong reason.

16,441. You said it was difficult to put a check upon fraud in this case, but it was not more difficult than it is now, is it?—No, not more difficult than when a man has two farms and gives up one; he can take the corn off the farm that he is holding on and send it to the other farm and he is compensated for it.

16,442. But you admit even now that there are great openings for fraud, and that it is a very difficult thing to guard against?—Yes, there are openings for fraud in most valuations.

16,443. But are there not openings greater than usual in this case, greater than the ordinary transactions on the farm?—There are cases where you cannot give your receipt; you cannot prove the money that has been paid.

16,444. Can you suggest any means by which the valuer can get reliable information as to the quantity of the crop of corn that he has grown on the one hand and the quantity that has been consumed by the animals on the other?—I think he could; our valuers are very sharp fellows, and they generally manage to get at the truth, I think.

Mr. C. S. Read.

3 Apr. 1894.

16,445. How are they to estimate the quantity that he has grown?—They cannot estimate it, he must prove it. The burden of proof of course must be upon the man. He must bring his books, he must bring his forms, and he must bring his bills if he sent the corn to be ground, and that sort of thing.

16,446. In the earlier part of your examination you told us that one of your great grievances, or one of the complaints you had to make of farmers was that they hardly any of them keep accounts?—If they do not keep accounts in this case it would be ——

16,447. A dead letter?—A dead letter, just the same as they are required under Schedule B. if they do not keep accounts they cannot get out of Schedule B. and they must be content to pay it.

16,448. Even if they kept accounts how are you to check their figures and know that they are right and that the accounts are fair?—I think you have means of proving that in the great majority of cases.

16,449. But you admit to the Commission that there would be very great difficulty about it?—Considerable difficulty, but not insurmountable difficulty.

Compensation for land laid down to grass.

16,450. What was the last suggestion that you made as to the amendment of the Agricultural Holdings Act?—I think it was two years' old seeds to be paid for if in good plant and the land clean and in good heart. That refers principally to the common practice now of keeping light land down two years, or three years possibly, in grass, and the tenant going out after he has kept it down two or three years.

16,451. I thought the last suggestion was some general clause which I did not quite catch the terms of?—It was this then—"Any other improvement increasing "the value of the holding as an agricultural holding "for which the tenant is not otherwise compensated" —I think that is the wording.

16,452. That is in order to embrace anything which is not already included in the Schedules?—It is; in the same way that I think the Schedule of the landlord embraces this general proviso.

Compensation for good farming.

16,453. With regard to the question of continuous good farming, do I understand you that for continuous bad farming the landlord is to be compensated on the other hand?—Decidedly.

16,454. I should like to ask you this question but perhaps you may not think it desirable to answer it, and would object to expressing your opinion; by which party as a general rule in these days would compensation have to be paid; will the compensation be for continuous high farming, or will it be for continuous bad farming?—I fear it would be for continuous bad farming.

16,455. Then I am afraid it would hit the tenant farmers rather severely?—I think, perhaps, it would at the present moment; it would be just, all the same for that.

The currency.

16,456. (*Mr. Giffen.*) With regard to the fall of prices after 1820, which you spoke of as being due to the 1*l.* notes, I suppose you did not mean to exclude the effect of other causes of the contraction of money at that time, such as the return to specie payments?—I only know what my father told me. He always attributed his great loss to the withdrawal of the 1*l.* notes; whether it was right or wrong, I do not know.

16,457. Still, as a matter of fact, that was only one incident in a great many changes which were happening at that time, such as the return to specie payments?—I think there must have been some other cause, no doubt.

16,458. But you did not wish to commit yourself personally to the opinion that it was the 1*l.* notes exclusively?—Certainly not exclusively, but I should think they were a considerable factor.

16,459. You spoke of the gradual diminution of coin since 1874—I think that was the phrase that you used?—I apprehend this, that the commerce of the world, and the population of the world have increased, and that gold has not increased in proportion to it.

Mr. C. S. Read. 13 Apr. 1894.

16,460. That is the very point I wish to bring out—you did not mean to imply that there had been an actual diminution of coin in use in this country?—No, I should think not, but I do not know.

16,461. Then you spoke of being in favour of the use of notes of 1*l.* now—do you think that that would be of some beneficial effect?—I fancy so, but I am no authority on that point; that is only my humble opinion.

16,462. You do not put it forward as a very material matter in comparison with all the other things that are happening at this time—it is the question of degree that I am putting at this moment?—I think it might be a good help.

16,463. But the effect would depend upon the amount of gold that would be set free by the issue of the 1*l.* notes?—Possibly.

16,464. Gold being our standard?—Yes.

16,465. Do you attach any importance to the issue of the notes against silver?—Yes, I think I should; you would have a very good profit to the Revenue by creating more silver coin.

16,466. Would the effect not be the same if you issued the notes without having silver against them, if you simply issued them without any precaution of that kind?—I should think, perhaps, it would; I do not know that, but I should think it is very likely.

16,467. And the advantage to the Revenue would be still greater, because they would cost you less?—They would cost less, I daresay. You would have some sort of security for them, I suppose. Do you not have security against the notes that are issued now?

16,468. That would raise the question whether in any case, gold being your standard money, you ought not to have gold as the security as a matter of necessity, and the silver would be a supplementary security—not precisely what was required?—If you are going to issue 1*l.* notes, and have gold as a security locked up against them, I think that would be of very little benefit.

16,469. I think Mr. Goschen's idea was to issue 1*l.* notes, and save some of the gold that would be set free by that means, but he thought he would set free some gold. The rise of prices that you have contemplated as being due to a change of money, would probably be a temporary rise, would it not—it would not last very long?—By the issue of those notes, do you mean?

16,470. No, by any monetary change whatsoever. Suppose you were to bring about a rise of prices, after a short time the effect would be completely felt, and you would have no further rise; is not that so?—I should say not; if you had plenty of the circulating medium going on in proportion to the extent of your business I apprehend that it would be a continuous rise.

16,471. Do you think that a continuous rise of prices extending over generations is possible?—No, not generations; I should not care about the generations to come; I want the present to be saved from ruin.

16,472. Still, you speak of a comparatively short period?—Yes.

16,473. I presume you attach much greater importance to a rise in agricultural prices, without a rise in other prices, than if the rise were to be quite general?—I should not object to a general rise all round on everything—I think most products are too low.

16,474. Would not the effect of that be that after a few years everybody would be exactly where they are now?—I think everybody who produced or paid wages would have more money in their pockets.

16,475. If the money had less purchasing power, where would be the advantage?—Because as a producer the commodity that you would produce, I apprehend, would be of a greater value than what you had to spend.

16,476. Then you expect the rise would not be quite general and uniform?—I think that in all probability the owners of gold, and the bullionists, and the bankers, and possibly the people who had fixed incomes, would fare rather worse, but anybody who employed labour or who was producing articles of agriculture or other products, I think would be benefited.

16,477. But after a short time there would not be room for a further improvement of that kind in the ordinary course of things?—I think it would be long enough to last my life, and that is one thing that I am thinking about more than anything else, I am sorry to say.

Mr. C. S. Read. 13 Apr. 1894.

16,478. The general effect of it then, as you describe it, would be to transfer something from the pockets of one man to the pockets of another, and that would benefit some people?—No, I say this: that the people who have got the money now have had a very unfair advantage, and that the money of the world has been contracted within the last few years.

16,479. You wish to give the other side a turn?—I do; and I think, what is more, that we deserve it as producers.

Compensation for home-grown produce.

16,480. (*Mr. Gilmour.*) Let us go back for a moment to that important question about the compensation for produce consumed on the farm itself. From your replies I take it that you consider the only safeguard for the landlord's interest would be the production by the tenant of properly authenticated accounts and farm books; you have not suggested, I think, any other way in which the landlords' interests would be protected?—I think that the foreman on the farm, and the labourers on the farm, if it were necessary, could give the required information which was not satisfactorily supplied by the books.

16,481. That would always be covered by what I have called properly authenticated accounts and books?—Yes, quite so.

16,482. Would you be prepared to consider that it should be a *sine quâ non* before a man was entitled to make a claim under that head, that he kept such books and such accounts, and that probably those books and accounts should be open to the inspection of the landlord or his agent whenever desired?—Of course they would not range over more than two years.

16,483. During the time for which compensation could be claimed—you must have a continuous state of proper book-keeping and farm accounts?—Yes. I quite agree that there should be these books kept, and that if they are not kept there should be no compensation. Whether it would be necessary for the landlord or his agent to look at them before the time I do not know.

Change in system of cultivation.

16,484. I was going to ask you if there were any new lines that you could suggest to the farmers in Norfolk whereby they might improve their position instead of the course they are following just now?—I have tried all sorts of changes myself, deviating from our usual course, and I have not found that they have prospered in any way except this, that I think we now have come to the conclusion that we might keep our lands down longer in grass seeds and by that means diminish the labour a little, and that we might keep more stock.

Horse breeding.

16,485. Norfolk has benefited by the demand for hackneys, has it not?—I think that there are a few real horsey men who have made a considerable amount of money by developing a better breed of hackneys, but at the same time there are enormous quantities of hackneys now in Norfolk that I am quite sure are of so poor a description that they will be a great drug upon the market very soon. Then there is also another thing with regard to the hackneys. I would rather sell 100 bullocks and 1,000 sheep than I would sell one hackney considering all the bother that it is to sell one hackney, and the time that it takes and the lies that have generally to be told in order to get a good price for a bad horse.

16,486. So that for the morality of the district, even, you would not encourage horse breeding?—I really would not. Not only that, but the young men take to these hackneys, and then they go all over the country to see what somebody else has got in that line, and it takes them off the farm, and I think that, as a rule, it has done almost as much harm as it has done good in diverting these young farmers particularly from considering bullocks and sheep and crops. A very interesting, and I do not doubt rather a fascinating, game is breeding hackneys.

The marking of foreign meat.

16,487. Turning to another subject, would you allow both home and foreign meat to be sold on the same premises if a man was licensed to sell foreign meat?—Yes, if he liked.

16,488. Do you think in that case that the licence would be a sufficient protection to the consuming public?—If, a man liked to go into a shop where there was foreign meat sold he must take his chance whether it is English or foreign; if he goes into a shop where

there is no such meat licensed to be sold he ought to get what he asks for, that is, English meat.

16,489. Has the Chamber of Agriculture in Norfolk that you are connected with considered the question of compensation for tuberculosis?—No.

16,490. Is it not a matter that has affected your part of the country then?—No, we do not seem to have much of it, or rather, perhaps, we do not know much of it. It may be there, you see, but we are not a breeding county, and, therefore, we do not take so much interest in it.

16,491. The question has not arisen at your fat stock marts, and carcases have not been confiscated afterwards?—I have never heard of one.

Value of land in Norfolk.

16,492. (*Mr. Little.*) You have given us some evidence on the depression in Norfolk as affecting rents, but could you supplement that by giving any evidence as to the decrease in the value of land for sale?—I should think the selling value of land has decreased from 30 to 60 per cent.; in some districts even more than 60 per cent.

16,493. More than the rent has decreased?—Yes, nobody seems to wish to buy any land. That is what I think is so extraordinary on the part of the British capitalist; that he will go and develop any rotten land scheme in the uttermost parts of the earth, and there is land here within 40 miles of London that is craving for capital, and he will not even look at it at the present depreciated price.

16,494. That is evidence of a want of confidence in the future?—Yes, I should think it is.

Farmers' expenses.

16,495. In answer to Lord Cobham you spoke of the increased expenses of the farmer: was that an absolute increase that you had in view or a relative increase—an increase in proportion to the value of the produce or an actual increase?—In proportion to the value of the produce I should say, rather than an actual increase. Of course with a man going into a farm at the present moment his capital would go further a good deal than it would some years ago, and we have also two or three very good pulls in the shape of having some artificial manures cheaper, and all of them much purer than they were years ago. We have also the great advantage of having healthy stock, very much improved by the legislation of the last 20 years.

Cost of labour.

16,496. If labour costs you, as it appears, 2*l.* an acre now when produce is worth only about two-thirds what it was, that 2*l.* is relatively a much greater sum?—Relatively it is.

16,497. The total sum paid for labour is about as much now as it was when wages were much higher—did I rightly understand that?—That is my experience, but on other farms I fear there is not so much labour employed as there was simply on account of the inability of the farmer to find the money to pay the wages.

16,498. But where the same amount of work is done, and where the farm is kept up to the same standard, would you say that about as much is paid for labour now as was paid when wages were higher?—I think so.

16,499. Does that not prove the increased cost of piecework?—It does.

16,500. Everything that is done costs more?—Yes.

16,501. I suppose the hours are shorter?—The hours are shorter.

16,502. And less work is done?—Less work is done.

16,503. Do you think that the earnings of the labourers, the annual earnings, have diminished to the same extent as their wages?—No, the price of piecework has hardly gone down at all.

16,504. You were asked about machinery having decreased the cost of labour?—It has not.

16,505. Is not machinery rather a necessity than an economy?—I do not think that machinery has decreased the cost of labour at all: it is an absolute necessity that you must have this machinery or you would not get the work done, and therefore, of course, it is a great advantage, but it is a saving of time and not of money.

16,506. The use of machinery means increased horse-power?—Yes, certainly.

16,507. It means increased tradesmen's bills?—Yes.

16,508. It means, also, rather higher wages to the skilled men who work the machines?—Yes.

16,509. And altogether you would not say that machinery has materially decreased the cost of production?—No, it has not decreased the cost of production, but it has made production easier because you can take advantage of time and weather.

Mr. C. S. Read.
13 Apr. 1894.

Labourers.

16,510. You spoke of a number of idle, unemployed young fellows, do you find an increased disinclination on the part of the labourers to regular employment and a preference for casual work at high wages?—No, I do not think I have found that; these young men are very ordinary labourers, as a rule.

16,511. But it is said that in some parts of the country the labourers generally prefer catch-work at high wages to regular work at moderate wages, but, apparently, that is not your experience?—No; our best labourers are always constantly employed, whatever weather it may be.

The Agricultural Holdings Act.

16,512. Upon the subject of the Agricultural Holdings Act I understand that you agree entirely with the principle of the Act, but that you would like to see some reform in the procedure and in the method of administering it?—Yes.

16,513. You said that only five per cent. of the tenancies in England at some recent date took advantage of the Act; that was a statement you quoted from "Bell's Weekly Messenger," I think?—Yes.

16,514. Do you think that is due to a preference for a simpler form of arbitration?—There are so many good tenant rights in different parts of England, and there are also so many excellent agreements at the present day that that may be one great reason why there are not more.

Claims and counter-claims.

16,515. I think you said that the landlord's counter claim was unlimited; it does not follow that a big claim is necessarily recognised?—Oh, dear no! Certainly not.

16,516. Then your meaning when you spoke of its being "unlimited" is that it frightened the tenant?—That is it.

16,517. The tenant is afraid to make a claim, because of the large claim that may be made against him?—I think it has been the general rule, that whenever a tenant has made a claim the landlord has made a bigger counter-claim.

16,518. Do you think that is a consequence of the landlord having time to consider the tenant's claim, and that it would be diminished by the claims being made simultaneously?—I am sure it would.

16,519. You told us that the notice of claim which you gave was not accepted, because it came too late, and that you had previously given a notice of claim; was your second claim an amplification of the first, or an entirely new subject?—It was an addition of some few tons of manure.

16,520. I think you said that the lawyer decided that eight weeks was not two months?—Yes.

16,521. Did this question come before the referee, or how did the lawyer come in?—The lawyer was the agent.

16,522. But was he the referee?—No.

16,523. Then I do not quite understand how the lawyer came in?—He objected, and the referee allowed his objection.

16,524. The umpire you mean?—The umpire.

16,525. Under the Act, the claim is to state the particulars and the amount of the claim, as far as reasonably may be?—Yes; I think it was a wrong decision, but it was a very trifling matter, so I did not trouble about it.

16,526. Then I think you said the landlord was allowed an indefinite time to make his claim, but is not the time limited to 14 days after the termination of the tenancy?—It may be by the Act, but it is not in Norfolk.

16,527. But it is by the Act, is it not?—I think you have told me so, but I did not know it.

16,528. You think that no injustice would be done by providing that both claim and counter-claim should be sent in 28 days before the termination of the tenancy?—I think that would be quite fair.

Payment of compensation.

16,529. Now as regards continuous high farming; does not the Act sanction compensation for any improvement of the kind that is of value to an in-

Mr. C. S. Read.
13 Apr. 1894.

coming tenant?—I do not think you will find it in the schedules.

16,530. No, but is it not an improvement; would not the Act sanction a higher scale of allowance to a man who had farmed well continuously, than to a man who had simply used cake and manure for a short time previous to quitting?—The Act might contemplate it, but it does not state it, and that is what I want it to do.

16,531. It would be quite in accordance with the Act if a higher scale of compensation was given where expenditure was judiciously and continuously made than where it was injudiciously or capriciously made?—Yes, I think it ought to be, but I am not aware that it is in the Act.

16,532. You are aware that some attempts have been made to grade farms, and to grade the compensation in respect of the cultivation; to give the higher rate of compensation to a first-class farm, and the lowest rate to the lowest class of farm in respect of condition. That would be recognising, to some extent, high farming and continuous good farming, would it not?—I was not aware that there was any grading in force anywhere. I think that our valuers now-a-days grade land in a way, and they say that manure which has been expended upon extremely light, friable, sandy soils is so soon exhausted that they do not allow for it more than one year, which I think is right.

16,533. I rather gathered that your opinion was that the same rate of compensation being given to a good as to a bad farmer on the same proportion of his outlay did not compensate the good farmer sufficiently and fairly?—I do not think it does.

16,534. But there is nothing in the Act to prevent a higher scale of compensation?—There is nothing to authorise it that I know of.

16,535. The principle of compensation is the value of the improvement?—Yes, but it is interpreted in Norfolk that those improvements must come under some schedule or another, and that there is nothing outside those schedules. It may be wrong, I hope it is.

16,536. I think you argued that compensation could not go further back than two years, is that in the Act?—Two years for manures, I think, is it not?

16,537. No, that was in the Act of 1875, which was repealed; compensation is not limited under the Act to manures for the last two years?—I think it ought to be in regard to transient manures.

Restrictions.

16,538. Then as regards restrictive covenants, would you say they are effectual in preventing what they were intended to prevent, the deterioration of the land?—Not in these times.

16,539. Where they are not observed they still press very hardly on an outgoing tenant sometimes?—That is about the only bother that they are to him, because he does not take much notice of them nowadays.

16,540. In the case of a tenancy ceasing unexpectedly by death, or by any other cause, the breach of an agreement may be made the subject of a serious claim?—It may, and it is.

16,541. Though you do not advocate legislation on this point you would like public opinion to be impressed with the necessity of giving up these restrictions to a considerable extent?—Yes, I would, and I do not think any money should be paid until it is proved that injury has been done.

16,542. Actual damage?—Actual damage.

16,543. That is the point I was coming to. If a farmer leaves his farm clean, and with good crops upon it, it does not matter, does it, how he has got those crops or how many of them he has had?—I think not.

16,544. So long as he leaves in Norfolk half the land in a fit state to grow a crop of corn and one-fourth in clean seeds, it does not matter whether these seeds have been down two years or whether a piece of barley has been grown after wheat?—I think it does with regard to old seeds, because there you have the fertility of the land very much increased for the succeeding corn crop.

16,545. Then I will not say it does not matter, I will say it does not damage the incoming tenant or the landlord?—Certainly not.

16,546. So long as the incoming tenant has half the land in corn and one-fourth in clean seeds he is not injure?—No.

Mr. C. S. Read.
13 Apr. 1894.

16,547. With regard to the valuation between the outgoing tenant and the landlord, you see nothing unfair in the incoming tenant paying for those things which he actually takes to?—No.

Payment by incoming tenant.

16,548. The hay and the roots?—Of course not.

16,549. Though they are called improvements by some they are entirely different from improvements of a permanent character?—Yes, they are actual crops.

16,550. The same with manures?—The same with manures.

16,551. The tenant can appropriate the manures in the course of a couple of years?—Yes, and he can consume the crops.

16,552. And there is no unfairness, therefore, in his paying for them?—Certainly not.

Land tax.

16,553. I think there is only one other question I want to ask you, and that is about the Land Tax, you suggest that the land tax should be given up to the counties; have you considered the difficulty that may be caused by a considerable amount of that tax having been redeemed?—I daresay there has been a great deal of it redeemed; but why I thought it was a fair tax was this: that, generally speaking, it is very much higher in the rural districts than it is in the densely populated parts of the counties. We in the rural districts do want some sort of subsidy from the Imperial Exchequer in aid of our rates, and, I think, that would be a fair one.

16,554. But suppose one county had redeemed all its land tax and another county had redeemed none, the one would have paid the land tax in perpetuity in a capital sum, and the other would have that tax remitted?—Yes.

16,555. That is an extreme illustration of the unfairness?—That is an extreme case; but with regard to the land tax, the owner of the land would still continue to pay the land tax, although he would pay it to the county instead of to the Imperial exchequer.

16,556. The county would be benefited where the land tax has not been redeemed?—No doubt.

16,557. Would not the same thing happen as between parish and parish; supposing the Land Tax were remitted in Norfolk, and half a dozen parishes paid a large amount and another half a dozen paid nothing at all, do you not think there would very soon arise a claim from the parishes which had paid the land tax for the amount to be spent upon them, and not put into the general fund?—No, I do not think that matters at all, because the man who pays the land tax now would still continue to pay it, and the other owner of the land, I suppose, would have redeemed it if there was no land tax in it.

16,558. (*Mr. Dalton.*) With regard to the land tax, is it your proposal that it should be handed over to the county council in each county?—Yes.

16,559. But apart from the question of redemption, the land tax is very high in some counties and very low in others, is it not?—Yes.

16,560. And not merely is it low in the thickly populated districts, but I see that in Cumberland it is ½*d.* per acre, while in Essex it is 11*d.*; so that it would work very differently in different counties?—Yes.

16,561. Apart from the redemption, when it was originally imposed in Cumberland, it was three farthings an acre, but it was 1*s.* 9½*d.* in Essex?—Yes.

16,562. You would be giving some counties a tremendous benefit, and others you would be giving practically nothing at all?—I think you would find, generally speaking, that the Land Tax is highest upon the ploughed ground, in Essex, Norfolk, Suffolk (the East Anglian counties), and some of the midland counties which have now suffered the most; and therefore, I think, it would be a slight compensation.

16,563. Do you know what it amounts to in Norfolk, per acre?—No.

16,564. About the same as in Essex, I suppose?—I should think it is something like 9*d.*, or something of that sort.

16,565. What is the county rate per acre—it is not so heavy as that, I suppose—it would kill the county rate, would it not?—It is not so heavy as that.

16,566. Then if you took it in Norfolk you would kill the county rate, and leave the County Council with a balance?—Yes, and they could soon find means of spending it by relieving other rates.

16,567. Is it desirable that they should?—I think there are a great number of things that we might very wisely do by means of the County Council, if we had the funds.

Deterioration in farming.

16,568. (*Mr. Lambert.*) With reference to your answer in reply to a question just now that tenant farmers usually farm badly at this present moment, or that at the end of their tenancies they leave them in an impoverished condition, do I understand that the amendments you are suggesting in the Agricultural Holdings Act would tend to remedy this state of affairs?—No, not at all; I do not think they would now, because farmers farm badly on account of their poverty, generally speaking; they do not farm with the idea of getting compensation when they go out at the end of the tenancy.

16,569. Are your amendments conceived with the idea that it should pay a man as well to leave a farm in a fertile, as in a foul condition?—Certainly.

16,570. And that is your object to restore the prosperity of the land in suggesting these amendments, or the fertility of the land, I will put it?—I want to keep it up, if it is possible, where it exists.

16,571. And that is your object in suggesting these amendments, to increase the fertility of the land?—Yes.

16,572. I think you have expressed the opinion that the present law is an incentive for the tenant farmer to leave the land in a foul, rather than in a fertile condition?—I do not say anything about the law; I say this, that it pays a man better to leave his land foul and impoverished than it does to leave it clean and fertile.

Payment of compensation.

16,573. I understand you to say that if a man leaves down grass, with a good plant, for two, or three, or four years, he should be compensated for it?—I think so.

16,574. Presuming that he utilised a water supply for watering a meadow, would you compensate him for that as well?—That is one of the improvements recorded in the Schedule.

16,575. And presuming that he planted fruit bushes, and had increased the lettable value of the holding, you would give him compensation for that as well?—Making market gardens, and planting fruit trees is one of the improvements, only it must be done with the consent of the landlord. It was thought that half an acre might be devoted to that without the consent of the landlord.

16,576. Presuming the landlord would not make these improvements, would you say that tenants should be compensated for making improvements which would add to the lettable value of the holding?—Yes, if they were real improvements, but a good many tenants who have money like to make improvements, or what they fancy are improvements, and they turn out failures.

16,577. But an efficient valuer would be competent to estimate the value of those improvements to the incoming tenant?—He might. But we will take the case of a man planting an orchard in a district which was incapable of producing good fruit, it would be very hard to ask anyone to pay, first of all, for what he did not want, and, in the second place, for what was of very little use.

16,578. My point is this: an efficient valuer, a man who knew his business, would not allow compensation for what was of little use, and which was planted in a spot not propitious for flourishing growth? — You might trust a valuer, I daresay, to do that, as a rule.

16,579. How would you arrive at the compensation to be paid to the incoming tenant by the landlord. Would you be in favour of a proposal of under certain sums, say 100*l.* or 200*l.*, to limit it to one valuer in order to save expense?—Yes, I think one valuer might cercertainly be employed if he was appointed by some authority if the two parties could not agree.

16,580. Would you be in favour of such a course as that?—No, I think not.

16,581. Not in the case of small claims?—I do not think there is any necessity to enforce it; generally speaking, it is the case now that only one valuer is employed on small holdings.

16,582. Do you think that the compensation for home-grown corn could be estimated by a competent valuer?—I think he could be satisfied that the corn had been expended, but I do not think he could estimate it.

16,583. I understand that you base your estimate of the improvements, or of the compensation to be awarded to the outgoing tenant, upon the value to the incoming tenant, and not upon the outlay?—Yes, in all things, except the manures and feeding stuffs.

16,584. I quite agree; I understand that; so that if a man improved the farm, the outlay on which cost him 100*l.*, but that was worth 150*l.* to the incoming tenant, and thereby added that amount to the value of the farm, you would give the outgoing tenant that 150*l.* although his outlay only came to 100*l.*, and *vice versâ* if the improvement was only worth 50*l.*, and the outgoing tenant had made an outlay of 100*l.*, you would only give him that 50*l.*?—Yes, I think that is fair, it is the increased value of the holding to an incoming tenant.

16,585. (*Viscount Cobham.*) Then the landlord would have no money interest in the improvement of his estate under that. Any improvement in the estate the landowner would have to pay for; that is what it comes to?—The landowner would have to pay for the improvement made by his tenant.

16,586. I only wish to make it clear that in that case he would have no money interest in his estate being improved?—The landlord would spend his own money to the best advantage that he could; but if he throws those burdens upon the tenant, and the tenant leaves them there, I think he ought to be compensated for them on leaving.

Tenants' capital.

16,587. (*Mr. Lambert.*) That is, a man should be compensated for the skill with which he makes an improvement?—Yes.

16,588. Have the tenants lost much capital in your part of the world?—Yes.

16,589. Now proportionately, which has lost the most, the tenants or the landlords?—Do you mean in capital?

16,590. Yes?—The capital being the value of the land.

16,591. And also the working capital of the tenant?—I should think the landlords have lost the most money.

16,592. In proportion?—Yes, in proportion. I think they have lost more money, but then they do not know what they have lost until such times as they sell their property.

Fall in prices.

16,593. How much has the agricultural produce in Norfolk that you usually produce, depreciated in price within the last 20 years?—I have just said that from the year 1874 wheat has gone down from 62*s.* 6*d.* to 25*s.* 4*d.*, and barley, I think, has gone down from 42*s.* a quarter to, I suppose, 25*s.*, or something of that sort now.

16,594. Are those your principal productions?—Those are our principal productions in the way of grain, and then, of course, we manufacture a large quantity of meat.

16,595. I want to know how much the whole of the produce that you would sell has depreciated in value, per cent.?—From the highest time to the lowest I should think 50 per cent.

Reduction of rent.

16,596. I think you said that rents had been reduced on an average 33 per cent.?—Yes, but that is really nothing more than a good guess. I have no means of proving it.

16,597. So that rents have not been reduced to the same extent as produce has decreased in value?—No.

Leases.

16,598. Do you consider leases as being advantageous, presuming the conditions are the same at the commencement of the tenancy—that is, that prices are the same at the commencement of the tenancy—as they are at the end?—They have been very conducive to the prosperity of the county of Norfolk; I should think especially on Lord Leicester's property and the other large properties where they have been common.

Notice to quit.

16,599. You would not think a six months' notice to quit from the landlord to the tenant would conduce to the increased fertility of the soil?—No.

The letting of farms.

16,600. What is the most lettable sized farm in your district?—It depends upon what the district is. If it is a light land district, the farms are large, and I do not see any chance of reducing them. I should think a farm of about from 200 to 400 acres is generally about a fair size.

Mr. C. S. Read.
13 Apr. 1894.

16,601. At present rents with a decrease of 33 per cent., how many applicants would you get for a farm, say of 250 to 300 acres?—It would depend very much upon whether there was a fair proportion of grass, whether you got any bid at all for it, and on the district in which it is, or its locality. I can give you a very good illustration. When I was a young man I know that Lord Leicester had a standing list of 300 good names for any farm that fell vacant, and now he has advertised some farms to let, and I believe he has had great difficulty in letting them.

Ground game.

16,602. Upon the subject of ground game, I understand you to say that it was impossible for a farmer to protect himself from the ground game which came out from a wood adjoining his field?—Yes.

16,603. Would you advocate an extension of the Ground Game Act, so as to give the tenant farmer a right to kill the ground game upon his holding exactly as he pleased?—Yes, I think so.

16,604. (*Viscount Cobham.*) Even then would he be able to keep them down?—No, he cannot. I do not see how, if you are to have hares and rabbits in a wood, and you have a piece of corn adjoining that wood, you can possibly kill all the hares and rabbits.

16,605. (*Mr. Lambert.*) You would give the tenant the right to kill ground game upon his estate just as he pleased?—Yes, I think I should, but at the same time if he had all those privileges he could not kill this ground game that came out of the adjoining wood.

The law of distraint.

16,606. The law of distraint, I understand you to say, is at present prejudicial to the farmer with capital?—I think so.

16,607. And it is preferable, of course, for a farmer to have capital before going into a farm?—Yes.

Management of estates.

16,608. You say something in your brief about the family lawyer. I wish to know what that means?—It used to be, generally speaking, on some estates that the family lawyer was invariably the agent of the estate, and he was the worse type of agent that you can imagine.

16,609. Are there many such agents now?—No, thank God, not many.

16,610. Then you also refer to young agents?—I mean young agents of this stamp. A young man goes to the Royal College for a year, and he learns chemistry and other kindred sciences; he then goes to a farmer——

16,611. (*Viscount Cobham.*) He is two years at the Agricultural College if he is to go through the course?—We will say he goes there for two years, or through the appointed course; he then goes to a farmer, and he spends the majority of his time in sporting and in attending to the usual routine of the farm, and then he blossoms into a full agent under some nobleman. I do not think, as a rule, they are very successful, that is all.

16,612. (*Mr. Lambert.*) Are there many such agents in your part of the world?—That is a new crop coming on, I think, rather than those that are there.

Mortgages and entails.

16,613. Have the landlords much property encumbered by mortgages and such like in your part of the world?—Yes, I fear there are. There are some very small farms encumbered. I might illustrate it by myself. I have inherited a small estate of 200 acres; that is entailed upon me as if I were a duke. I have no son I am thankful to say, but it is mortgaged for considerably more than it is worth.

16,614. And you think that the law of entail is prejudicial to the present owner?—It is in my case certainly, because I might have sold it when I came into possession of it, and I wish I could. But I do not think the law of entail as it affects the large estates has been otherwise than an advantage.

16,615. Why do you think it has been an advantage?—Because taking the county of Norfolk I do not hesitate to say that on the large estates there is more produce, the land is better farmed, and the buildings are better than they are upon the small estates.

16,616. Is that because the landlords have property other than that which they derive from the land?—I think not. I think, generally speaking, they are rich men, and can afford to develop their property.

16,617. It is possibly because the rents have not been increased in the same ratio as they have been upon the smaller estates?—I think that is very likely.

16,618. Do you think that many landlords, being encumbered sometimes, have the will but have not the means to carry out improvements?—Often.

Mr. C. S. Read.
13 Apr. 1894.

The middleman.

16,619. I am going to a different topic altogether now. Could you give us any estimate as to what profit accrues between the producer, that is the farmer, and the consumer upon beef and mutton and dairy produce. I will take beef first, if you please?—No.

16,620. You could not?—No, I could not. I believe that the middleman is essential, but I think he has stuck to a larger portion of the plunder than he had had any right to in the past few years.

16,621. Do you think that there is any hope for a project in the direction of bringing the consumer and the producer closer together?—It has not been successful in those cases in which I have tried it.

16,622. Why has it not been very successful?—I think, generally speaking, you cannot rely upon your supply either in quantity or in quality, and there is always sure to be a very large combination of the traders against any scheme of that sort.

Farming in Norfolk.

16,623. (*Mr. Everett.*) You heard, I think, the evidence given by Sir Gabriel Goldney yesterday, in which he said that farming in these days might be made to pay a very large return on the capital employed by the tenant. I gather from the evidence that you have given that you do not agree with Sir Gabriel, at least as regards Norfolk?—Sir Gabriel Goldney, I think, spoke chiefly of pasture land, where he had an opportunity of selling milk. I fancy that on farms of that description you may still make a profit, but that is a totally different thing from the arable lands of East Anglia.

16,624. The farmers of Norfolk, I think, are reputed to be amongst the most skilful cultivators in England, are they not?—We fancy ourselves so.

16,625. Even they have not been able to make a profit on their farms in recent years?—Certainly, not as a body.

The malt tax.

16,626. I think you very well remember the agitation which culminated in the repeal of the malt tax?—I do.

16,627. You personally took a very active part in it, I believe?—I am sorry to say I did.

16,628. I should, perhaps, hardly be wrong, if I said that that active part had a good deal to do with your being returned to Parliament the first time that you were returned?—I daresay it had.

16,629. You were, I believe, the first tenant farmer who was returned to Parliament in modern times?—Possibly I was.

16,630. You were returned against a member of the great family of Lord Leicester?—Yes.

16,631. I think, if I remember right, that the object of the repealers was the entire removal of taxation from the peoples' favourite beverage?—It was.

16,632. That was their object?—Yes.

16,633. They desired to clear the barley lands, which are practically the vineyards of England from all taxation?—Yes, that was our idea and our hope, which has been miserably frustrated.

16,634. And the transfer of the tax which Mr. Gladstone effected was accepted rather as a step on the road than as the final goal?—Yes, we thought it right to remove the tax from the raw material to the manufactured article.

16,635. And gave some chance of removing it altogether?—Yes, there has been a great boon—you must not forget that, to the labourers by their being allowed to brew without any duty at all, that has been a great relief in our part of the world where they do brew a good bit, especially in haysell, and in harvest.

16,636. And is much appreciated by the agricultural labourers in the Eastern counties?—Not so much as it ought to be.

16,637. It is in Suffolk?—I am glad to hear it, but our people do not seem to appreciate it as much as they do otherwise. I am sure every cottager ought to brew.

The malt tax and the price of barley.

16,638. You have been questioned by the Scotch members of this Commission in reference to the effect of the transfer of the duty from malt to beer, with a view to show that it has been prejudicial to the farmer. I have before me figures which show that wheat has

Mr. C. S. Read.
13 Apr. 1894.

declined in value since that time over 40 per cent.; that wool, I think, has declined 100 per cent., and live stock certainly 33 per cent., while barley has only declined 18 per cent.; would not that seem to show that there had been something in relation to barley which had stayed the fall in regard to it, instead of having accelerated the fall?—Yes, I think so. I think, as a farmer, that it was a right thing to transfer the tax from malt to beer; but I also think that one reason why it has not fallen in the same proportion as wheat is that a good many silver countries which can grow wheat do not produce any barley.

16,639. Still, wool has fallen more than wheat has, and live stock not quite as much as wheat?—Yes.

16,640. But more than barley a good deal?—Yes.

16,641. And they do not come much from silver countries, I think. As a fact, barley has fallen less than any other of our products, at any rate in the eastern counties?—Certainly, it is limited to the extent, I think, of growing the best milling barleys. You cannot grow it everywhere, and you can grow wheat apparently from pole to pole.

16,642. The point I want to bring out was that, looking at the movement of the prices of the different parts of the produce of the farm, it would look as though the change made in regard to the malt tax had stayed the fall in that particular part of our product, instead of having accelerated it, as the Scotch gentlemen appeared to think?—I do not think it has accelerated it at all, and I would rather fancy that it has retarded it.

16,643. As a matter of fact, we are getting a better price relatively for our barley still than we are for anything else on the farm?—Yes, you sell your barley at more per bushel than you do your wheat.

Beer.

16,644. You were saying that since the repeal of the malt tax the price of beer has not been lowered to the public, though the material of which the beer is made is much cheaper?—Yes.

16,645. Supposing that the entire control over licences were put into the hands of parish councils, cannot you conceive it likely that the parishioners would say to the publican: "Now, Mr. Publican, if you do not sell us "our favourite drink at a reasonable price as compared "with the cost of the materials from which it is brewed "we will transfer your licence to somebody else," and in that way would they not give effect to the cheapening of the price of the beer relatively to the cheapening of the material?—If you are going to give that power into the hands of village councils I daresay they would not be slow in exercising it.

16,646. Would not they very likely have something to say about the quality of the beer too if it were such as flew to their heads too quickly?—No. I do not know that myself. I believe that every labourer who goes to the public house likes to feel different after drinking a glass of beer. The table beer that we buy and get you might drink a gallon of before it would intoxicate you, I am sure.

16,647. The home made beer you mean?—Yes.

16,648. Do you not find that your labourers in Norfolk prefer the home-made beer to work upon rather than the public house beer?—I think they do to work upon, but if they are convivially inclined they prefer the public house beer.

Condition of agriculture before 1879.

16,649. Coming to the condition of agriculture, you had a great and long-continued prosperity in Norfolk in agriculture under Free Trade, had you not?—Yes; we have had our ups and downs, but we had a very good time of it about the year 1872 to 1879. I think we were very prosperous just then—and also, of course, during those dreadful wars which were raging all over the world we had the advantage then of enhanced prices.

16,650. You had good times from 1852 or 1853 to 1874 or 1875, had you not?—Yes, I think so.

16,651. On the whole agriculture was in great prosperity in the county of Norfolk then?—Yes.

The currency.

16,652. You have expressed to Mr. Chaplin the opinion that the expansion of the currency which resulted from the great gold discoveries had a good deal to do with that prosperity?—I think I may say I am sure of it.

16,653. What would be your opinion if better prices and agricultural prosperity returned again through another expansion of the currency; would the labourers be able to reap their fair share of the improved condition of the industry?—I have no doubt they would. We should be very glad, if we could afford it, to pay more now.

Mr. C. Read.
13 Apr. 1

16,654. What do you suppose, in round figures, at a rough guess, the total depreciation of the value of the county of Norfolk is as compared with 20 years ago; you have over 1,000,000 acres of agricultural land, have you not?—Yes.

Value o land in Norfolk.

16,655. Taking the losses in the value of the property of the owner, and the losses of the capital of the farmer as compared with 20 years ago, how big a sum do you think it would roughly run up to?—I should not like to say, but I fancy that if a valuation had been made 20 years ago we should pay about 10*s.* in the pound now if we were sold up.

16,656. The capital value in the county of Norfolk has gone down something like one-half then?—I do think so.

16,657. If that depreciation is largely owing to the appreciation of money brought about by law and not by nature, would there not be some equity in adjusting contracts fixed in money to the altered conditions by law too, such as mortgages and family charges?—I think that that is rather beyond me, if you do not mind my objecting to give an answer.

The Agr tural Ho ings Act

16,658. Then, turning from that to the Agricultural Holdings Act, you have expressed your opinion that a fixed description of a farm when entered upon would be an excellent thing to be kept for comparison when the tenant quitted?—Yes.

Valuatio

16,659. If that were done, and the principle were affirmed that a tenant should be entitled to any unexhausted value which he had added to the farm, would it not really be better that the amount of the value should be left entirely to valuers than to attempt to make a valuation by Act of Parliament?—I would rather have it so certainly.

The law distress.

16,660. (*Viscount Cobham.*) You said, I think, that the abolition of the law of distraint would press very hardly upon struggling farmers. I think that was your expression?—Yes, at this present juncture.

16,661. It would clear them away to a great extent?—I do not think that the landowners could give the credit that they do now.

16,662. Some of the witnesses that we have had before us said they thought that it would be a good thing because, owing to the reduction of competition and the consequent reduction of rents, men of capital would come in and take the vacant farms; do you agree with that view?—I do not know where they are to come from.

16,663. You think that the land would not be cultivated?—I think that the land would be mostly left in the hands of the owners at present prices.

Slaught of foreig cattle.

16,664. Do you think that if the live stock importation was stopped this country could eventually supply the lean stock required for our purposes?—What I feel as a winter grazier is this: that if I am exposed to all the benefits, or rather all the evils of Free Trade by having the meat here from every country under Heaven if I can by any possibility obtain cheap healthy stores from our own dominions, I do not think they ought to be excluded. I think the question you asked was: do you think if live stock were entirely excluded from coming into the country that we could breed enough?

16,665. Yes?—I should think we could eventually.

16,666. But not as cheaply as under the present system?—Not so cheaply as the Canadians have sent us at present, they are good well-bred cattle, better bred than the Irish as a rule, they are older, and they are cheaper.

Paymen compens tion.

16,667. I put it to you that under the suggestions that you have made to us landowners would not have much interest in the improvement of their estates because they would have to pay for all such improvements the full value, irrespective of whatever rent that they might receive from the incoming tenant?—My opinion is this: that the landlord ought to make all the permanent improvements on his property, and not cast that unfair burden upon his tenants. I believe that has been the source of almost all the evils in Ireland, that the landlord did not do his duty in the first instance, and make the permanent improvements If the tenant has made them, then I say he ought to be compensated; but I would not give him any particular advantage or inducement to make those improvements

Mr. C. S. Read. 13 Apr. 1894.

which I think ought to be made by the owner of the soil

16,668. But I am referring more to high cultivation and clean farming?—If the tenant has improved the letting value of the farm by those means, I think he ought to be compensated.

16,669. Supposing he has not improved the letting value; supposing, as a matter of fact, that on re-letting the rent falls?—I would put it rather in this way, that he has not decreased the letting value in these days—that he has prevented the decrease in the letting value.

16,670. You think that he should be compensated for that?—Yes; of course in olden time we always used to talk about the increased letting value, now we want to stop the decrease.

16,671. Of course if the fall of rents goes on as it has gone on, and at every re-letting the landlord has to pay a large sum for the mere maintenance of the land in a good condition, his funds will sooner or later come to an end; will not that be the case?—Yes; but I think the tenant farmer would come to grief sooner if he was not paid for what he had left behind him.

16,672. I am not disputing the equity of your proposal. I am merely trying to find out whether you see what the result will be?—I do not think there will be very much.

Mr. C. S. Read. 13 Apr. 1894.

16,673. You said that on the other hand the tenant should be fined for bad cultivation?—Certainly.

16,674. But in how many cases do you suppose the landlord would get an equivalent for the deteriorated cultivation of the farm from the outgoing tenant?—The landlord gets it now almost invariably by his agreement. His tenant never goes out but what there is the hay and the roots on the farm, and they are generally more than his rent, and he can deduct it from them.

16,675-6. Does the landlord from your experience as a rule get an equivalent set off against the manures, hay and so on, left on the farm?—The dilapidations of the tenant?

16,677. For the dilapidations and deterioration of the farm?—Yes, I think he does; but Mr. Simpson will tell you much more about that than I can. If there is any dilapidation on the farm it is generally taken off the hay and the roots.

(*See* Supplementary Statement subsequently sent by Mr. Clare Sewell Read, Appendix II.)

The witness withdrew.

Mr. W. T. Simpson.

Mr. William Thomas Simpson called and examined.

Mr. W. T. Simpson.

16,678. (*Viscount Cobham.*) I think you are an agricultural auctioneer and valuer in the eastern counties?—Yes, I am.

16,679. How long have you been in practice?—About 40 years.

16,680. Are you a land agent as well?—No, except for one small estate.

16,681. But you are a practical farmer I believe?—Yes.

16,682. How much have you farmed?—About 900 acres.

16,683. Up to now?—Yes.

16,684. Since 1861?—Yes.

16,685. Where is your farm?—At Attleboro' and Old Buckenham in Norfolk.

16,686. In central Norfolk is that?—In 'mid-Norfolk, 15 miles from Norwich, equi-distant between Norwich and Thetford, on the Cambridge line.

16,687. Is that farm a fairly good representative Norfolk farm?—It would be better than the generality of the Norfolk farms; it is a better quality of land.

16,688. Do you farm it as a tenant farmer?—Partly as tenant and partly as owner.

16,689. How much of each?—Two-thirds as tenant and one-third as owner.

Profits from farming, 1861-79.

16,690. Could you give us your experience of farming since you have had the farm?—From 1861 to 1879 I found it a fairly remunerative occupation; that is to say, I put 10,000*l.* into the two farms that I hold, and from 1861 up to 1879 I got an average interest on my capital of 8½ per cent.

16,691. After paying the rent upon the whole?—After charging myself with rent.

16,692. Was your farm to some extent of a special character, that is to say, did you work it into your business as an auctioneer?—No, I kept it entirely distinct as a farm. I have a separate banking account for it, and I have kept it entirely independent of my business.

System of cultivation.

16,693. What has been your system of cultivation?—The Norfolk four-course system.

16,694. How much permanent grass have you on your land?—I would rather refer to the 470 acres, my home farm, if you will allow me to do so.

16,695. Yes?—400 acres of that is arable and 70 acres pasture.

16,696. Is the whole of that rented?—It is partly my own property and partly rented.

Profit and loss account.

16,697. What has been your experience since 1879?—If you will allow me I will take from 1884 up to 1893—that is up to last year; my experience for the last 10 years is that I have made a total loss of 460*l.* on the 10 years without charging any interest on capital.

16,698. After charging rent?—Charging rent, but no interest on capital.

16,699. Has the loss been fairly consistent since 1884, or has it been on an increasing scale?—For the year 1884 I had a profit of 71*l.*; for 1885 I had a loss of 201*l.*; for 1886 I had a profit of 386*l.*; for 1887 I had a profit of 186*l.*; for 1888 I had a loss of 63*l.*; for 1889 I had a profit of 105*l.*; for 1890 I had a loss of 181*l.*; for 1891 I had a loss of 63*l.*; for 1892 I had a loss of 450*l.*; and for 1893 I had a loss of 250*l.*

16,700. (*Mr. Everett.*) And you have not charged interest in that case, I understand?—No interest on capital has been charged.

16,701. You have put so much money into it?—Yes, I have, but as I say, no interest is charged.

16,702. (*Mr. Little.*) Are those figures based upon a valuation each year?—Yes.

16,703. A valuation of the stock at market price?—Yes.

16,704. (*Sir Nigel Kingscote.*) Both live and dead?—Yes.

16,705. (*Viscount Cobham.*) So that in the best year you have had since 1885 you only made 386*l.*?—Yes, that is the best year.

16,706. And on the worst year you lost considerably more than that?—Yes. I think I have told you that from 1861 to 1879 my interest on capital was 8½ per cent. as a profit.

16,707. To what do you chiefly attribute your farming losses?—To reduction and depreciation in prices.

16,708. Of all prices?—On corn more particularly.

16,709. Is your farm chiefly a corn-producing one?—Yes, and it is good corn land. I can give you an instance of one of the best years—1873. My corn realised then 3,247*l.*

16,710. (*Mr. Little.*) That would not be on the 470 acres, would it?—Yes.

16,711. On the 470 acres alone?—Yes.

16,712. (*Viscount Cobham.*) How much per acre would that be?—On that farm there are 400 acres of arable land which have been farmed on the four-course system usually, but that year I grew 250 acres of corn and seeds. The profit on the stock, allowing for the amount made more than the cost, was 2,236*l.* The total receipts for the year 1873 were 5,890*l.*, as there are other items besides the corn sold off.

16,713. What was your per-centage of profit that year?—The profit that year was 1,020*l.*

16,714. Something more than 10 per cent?—Yes.

16,715. Was that your best year?—That was my best year.

16,716. (*Mr. Dalton.*) How much capital is on this particular farm?—6,000*l.*

Mr. W. T. Simpson.
13 Apr. 1894.

16,717. (*Viscount Cobham.*) From your knowledge of Norfolk farmers what should you say has been their experience over the same period of time?—Very similar, except that many of the Norfolk farmers not having the capital, and they could hardly make as good a return as I have done myself. Mine is fortunately not borrowed capital, so I have had no interest to pay.

Witness's farm compared with Norfolk farms generally.

16,718. I suppose your rent has been diminished to meet the depreciation?—The rent has been diminished from 37*s.* 6*d.* per acre to 25*s.* per acre.

16,719. Which is still a high rent for Norfolk?—It is tithe free I may tell you

16,720–1. But it is a high rent for Norfolk?—Yes, but not for my parish. I happen to be in a very good parish where the land is considered better than it is in many districts, and 20*s.* to 25*s.* an acre would be a fair average rent.

16,722. Does it compare favourably with Norfolk generally in its ability to carry permanent pasture?—Yes, but my experience is that on good land I can carry more stock by land that is cultivated than on permanent pasture. Our rotation of crops, roots, hay, and corn enables me to carry more stock than I should do if that land was all pasture and thereby to make a greater return.

Reduction of rents.

16,723. How much have rents fallen generally? Mr. Read said 33 per cent. Would you agree with him in that?—From 30 to 50 per cent. and in some cases more than 50 per cent.

16,724. Could you not state it more closely than that as an average? Mr. Read's average was 33, I think?—I should think he was quite within the average. I should say they have fallen to a greater extent.

Position of landlords and tenants.

16,725. What is the position now of landlords and tenants respectively?—It is a very bad position, the landlords and the tenants both are in a much worse position than the outside public are aware of.

16,726. Do you confirm everything Mr. Read said on that point?—I do. Only those who are behind the scenes know the position in which many of the Norfolk farmers are at this moment.

Value of land in Norfolk.

16,727. I think he said that the selling value of agricultural land had fallen even more than the rents?—I can give you a little idea of the value of agricultural land at the present time in Norfolk. I have been within the last six weeks over a farm of 500 acres, good strong land, corn-growing land. I went to advise the mortgagee, it being mortgaged for 13,000*l.* The present annual value of that farm is 15*s.* per acre—which makes an annual value of 375*l.* which at 20 years' purchase—the largest number of years I dare take such land at at the present time. That makes 7,500*l.* as the value at which I estimate that 500 acres now which is mortgaged at 13,000*l.* and which cost 16,000*l.* thirty years ago.

16,728. Have you any other case that you could quote?—I have a case of 1,400 acres of very good land, well cultivated, which cost, including improvements, 25,000*l.* 25 years ago. My valuation upon it at the present moment is 30,000*l.* The present value is about 30,000*l.*, and at that low figure it is practically unsaleable.

16,729. Is that mortgaged?—It is mortgaged.

16,730. For more than 30,000*l.*?—It is mortgaged for more than 30,000*l.*

16,731. And you consider it absolutely unsalcable?—It is unsalcable at the present moment; no one will look at land now.

16,732. Is it a good property for shooting?—It is not a sporting property, there is on that farm a grand herd of cattle, a fine flock of sheep, a good stud of cart horses—in fact everything is good, and everything possible has been done to make it pay.

16,733. Are the buildings in good order in each case?—The buildings are all that is required for the occupation.

16,734–5. (*Mr. Everett.*) Has it been occupied by the owner?—Yes.

16,736. (*Viscount Cobham.*) Do the mortgagees generally carry it on in the hope of better times, or do they sell?—I am advising the mortgagee in this particular instance, and I have advised him to carry it on, that is, to assist the owner by reducing the rate of interest—it was 4 per cent.—to 3 per cent.

Mr. W. T. Simpson.
13 Apr

16,737. Although his security has so much deteriorated?—Yes; but I consider it for his advantage to assist the owner if possible to keep on in the hope of better times, hoping that there will be a chance that prices will revive.

Mortgaged land.

16,738. Is there much land in Norfolk in the hands of mortgagees?—It is in the hands of owners who have mortgaged; I would not say it is in the hands of mortgagees.

16,739. Do you not know of any cases where the mortgagees have entered into the land?—Here and there a case. But generally the mortgagees will not farm the land, but will sell at any sacrifice rather than farm it.

Effect o the depres.

16,740. Have you observed much difference between the incidence of the depression upon large and upon small farmers?—I think it presses all round; every farmer is affected by it, large, small, and medium.

16,741. As to occupying owners, have they suffered less or more?—The occupying owner has decidedly suffered more than anyone. He has had not only to bear the depreciation in the capital value of his land, but he has had to keep up repairs, and he has also suffered from the unprofitable farming of the land.

16,742. Have most of them gone to the wall?—Many have.

16,743. Have they sold their properties?—Some have sold and others are holding on by sufferance, by the mortgagees holding back and taking a lower rate of interest. I could also state an instance out of my own county; Mr. Little would possibly know the country. I was over a farm in Lincolnshire last week, consisting of 350 acres of land, which cost in the year 1876 about 22,000*l.*, a rate of about 63*l.* an acre. That farm was mortgaged for 18,000*l.* at that time, and I am afraid the present value would not be more than 12,000*l.*

16,744. Is that the case of a small property?—That is a farm of 350 acres.

16,745. Was it in the occupation of the owner?—It is in the occupation of the owner. It is fine fen land; good fen land.

16,746. I have been asking you chiefly with reference to Norfolk, but do the answers you have given apply generally to the eastern counties?—I think so.

16,747. Including Lincolnshire?—I think so. I will not say that I am an authority on Lincolnshire, because I have not been so much into it, but, generally, my answers apply to the eastern counties.

Dairying.

16,748. There are a certain number of dairy farmers who have done better, are there not?—We have very little dairy farming in Norfolk, we have so little pasture land.

16,749. But what there are they have done better?—Yes, those living near a town where they have a sale for their milk have stood their ground very fairly, and again the large farmers where they have kept a good herd and bred their stock sheep and horses have fairly stood their ground.

16,750. But they are the exceptions, are they not, in the eastern counties?—Yes, they are the exceptions.

Sheep breeding.

16,751. In what part of the eastern counties do you find farmers who have reared and bred their own stock?—There are a few spotted here and there all over the district. Where there is sufficient grass land, to enable a man to keep 30, or 40 cows, he goes into dairying and breeding. But there are very few farmers of that description in the eastern counties. It is principally arable land. In the county of Suffolk I have had considerable experience; I know a small farm of 200 acres in the neighbourhood of Halesworth, strong corn-growing land, which cost 4,000*l.* I was asked if I could sell it; my reply was yes, if you will take 7*l.* or 8*l.* an acre for it—that would be 1,500*l.* I would not advise my client to go to the expense of a sale unless he was prepared to take 1,500*l.* for what cost 4,000*l.*

Value of land in Suffolk.

16,752. Is it an ordinary arable farm?—It is a heavy land farm with a fair proportion of pasture upon it. It is a very strong land, very similar to a good deal of the Essex heavy land. The owner consulted me upon it. He said, "Am I to let it, or what am I to do." The original rent was 200*l.* a year. Two men failed in it. It then fell into the owner's hands, and I advised him to take 50*l.* a year rent rather than farm it himself. He is taking now 50*l.* a year for the 200 acres of land, tithe free. The tithe at the present time at the reduced

Mr. W. T. Simpson. 13 Apr. 1894.

value is 27*l.* 10*s.*; the land and property tax and other expenses, including repairs, average about 22*l.* a year, so that the owner really on this particular farm has worse than nothing—he is out of pocket, he is a loser, and now wishes it had been sold at 1,500*l.*

Wages.

16,753. He could not get it now?—I do not believe it is saleable.

16,754. Have the labourers shared in the general depression?—Not so much. I do not think they have felt the pinch so much as the landlord and the tenant.

16,755. Compared with 10 years ago have wages been maintained?—Fairly; they are not so high as they were. In 1873 we were paying 13*s.* a week, now we are paying 10*s.* and 11*s.*

16,756. Could you give us the figures of your labour bill for the last 10 years, taking two or three selected years?—I have the figures here as far back as 1867.

16,757. Just tell us what it was in 1867?—My labour bill in 1867 on 470 acres of land was 887*l.*

16,758. What was it in 1873?—1,152.

16,759. What was it in 1879?—1,045*l.*

16,760. What was it in 1884?—1,016*l.*

16,761. And what was it last year?—It amounted to 860*l.*

16,762. (*Mr. Little.*) The figures for 1892 will do?—They amount to 953*l.* In 1891 the labour bill was 948*l.*

16,763. (*Viscount Cobham.*) Is it about the same now?—It is about the same, I cannot keep it down; we are paying the same rate of wages—that is 11*s.* per week.

Labour.

16,764. Do you employ about the same amount of labour?—Yes, I cannot do without labour.

16,765. Have you to employ men to a greater extent than you did, owing to the women and children being less available?—Yes, we have no female labour now and no boys; we are obliged to employ men to do what formerly we could get done by women.

16,766. So would you say that the labourers generally have lost the earnings of their wives and children, but nevertheless they have not lost on the whole?—They have lost the labour of their wives.

16,767. But they are in as good a position?—The necessaries of life are so much cheaper. The rents are comparatively low, and they have many advantages.

16,768-69. On the whole their condition has improved then?—The labourer's condition has improved; he has not felt the pinch except in the heavy land districts this year, where there have been a great many out of work. Generally the agricultural labourer's position has improved, and his general tone is better.

16,770. But as a working machine has he improved?—No, I cannot say that; I cannot say that he is of so much value to us; we do not get so much for our money now as we did 20 years ago.

16,771. What is that owing to?—I think there is less inclination to work; they have shorter hours; you cannot get them to work so long as they used to do.

16,772. Their physique has not fallen off, has it?—No, I think not.

16,773. Their intelligence, presumably, ought to have been developed since 1872?—They get less fond of manual labour and hard work.

16,774. More unsettled?—Yes.

Uncultivated land.

16,775. Do you consider that in the poor land districts they will be permanently out of work—is the land going out of cultivation?—Yes, the land is going out of cultivation; more land is laid down to grass. In the light lands hundreds of acres are going out, and that must decrease the labour required.

16,776. Will those lands carry grass?—For two or three years we let them lay as long as possible; we break it up again and take a crop, and then lay it down again. By that means we decrease the manual and horse labour upon it—we can do away with a team or two of horses.

16,777. Very little land has actually gone out of cultivation in the eastern counties that you are speaking of, I understand?—Yes.

16,778. You are not speaking of Essex?—No, but of Norfolk and Suffolk.

16,779. Within the district you know best you know of little land that has gone entirely out of cultivation?—Not entirely out of cultivation.

Mr. W. T. Simpson. 13 Apr. 1894.

16,780. I suppose you know of a good bit of land that has been reclaimed, and which is not now paying the cost of reclamation?—Thousands of acres were broken up in the times of high prices which are now not paying the cost of cultivation.

16,781. And a certain amount reclaimed from the sea?—Yes.

16,782. There is no encouragement to do that now?—Not at the present time; it would not pay the cost of the reclamation.

16,783. Is sainfoin much used?—In certain districts on the chalk subsoils.

16,784. Do you leave it down?—We leave it down for two years.

16,785. Not more?—Not often longer than two years. The land gets foul if you let it lie longer.

Changes of tenancy.

16,786. Have changes of tenancy been frequent?—Not so frequent within the last two years. Landlords will do anything now rather than lose a tenant. They will take any rent that a good tenant will offer them rather than have the farm thrown on to their own hands.

16,787. But earlier during the period of depression I presume many farmers who had lost all, or almost all their capital had quitted their farms?—Yes, the weakest are gone.

16,788. Who have taken their places?—The landlords in a great many instances—in most.

16,789. Not many strangers?—No.

Immigration of north country farmers.

16,790. Any Scotchmen?—We find that the Scotch are coming in, and from Northumberland and Cumberland have now been introduced.

16,791. Have they done pretty well?—I can hardly answer that question. They are men who come determined to make a living by hook or by crook. They do what many of our Norfolk farmers are now compelled to do, assist with the dairy, poultry, and in other capacities.

16,792. They have not taken the larger farms, I suppose?—Not generally; but we have a few instances where they have taken large—sheep farms.

16,793. Is the growing of wheat diminishing?—Considerably.

16,794. Have barley and oats taken the place of it?—Yes, and permanent grasses.

Technical instruction.

16,795. Has the County Council done much to improve the education of the farmers or of the labourers?—It has not done much at present, and I am sorry to say that the labourers, as far as my own district is concerned, do not appreciate the advantages offered. It is with the greatest difficulty that we can get them to attend the lectures and dairy classes. We find that the farmers' daughters are much more willing to attend and to seek information than the labourers' daughters or the wives. We have to beg them to come to the lectures, and many of them make a great objection to it. They say that they know quite as much as they can be taught.

16,796. Are the principles of agriculture taught in the elementary schools?—No, they have not been.

16,797. You do not find that the labourers generally are taking a more intelligent interest in their work, do you?—Not at all.

16,798. Rather the contrary would you say?—My experience is that the more they are educated the less anxious are they to stick to agriculture.

16,799. Even if they are educated in agriculture?—They have not been educated in agriculture. We find now that all the more intelligent, both lads and girls, so soon as they have received an eduction go away. The better lads get appointments as clerks at the railway stations, for instance. Everything in their education tends to lead them away from the land, and they dislike the drudgery of farm work.

Foreign competition.

16,800. To what do you mainly attribute the great depression of agriculture in the eastern counties?—To foreign competition.

Bad season.

16,801. Wholly?—Principally; I think that in the last three years—the seasons—have had something to do with it; but mainly it is due to the decreased value of what we produce.

16,802. You would not go so far as Mr. Read did in attributing a good deal of the depression to the bad seasons, would you?—It is partially owing to that.

Mr. W. T. Simpson.
13 Apr. 1894.

16,803. He said as far back as 1874, I think?—We have not had bad seasons ever since then. We have only had three really bad seasons, and those were during the last three years. You cannot put it down to that; it is mainly owing to the decreased value of what we grow. For instance, 20 years ago land of which we could make 10*l.* or 12*l.* an acre for our crop, we have now hard work to make 5*l.* or 6*l.* off; the value of an acre of corn now is not more than 50 per cent. of what it was 10, 20, and 30 years ago.

Foreign competition.

16,804. Have you any suggestions to make with regard to the effects of foreign competition and the diminution of prices thereby caused?—I cannot see any remedy for it, but that for which we are not prepared, or the country is not prepared. We cannot protect our corn more than we protect anything else, and I see no remedy for it except in decreased cost of production; and in hoping that some of the burdens may be removed from the land, or if they are not removed, that they will not be increased. I feel that under the recent legislation—the Parish Councils Bill for instance—the expenses on the land or the rates will be higher instead of lower. There is very little doubt that the Parish Councils Bill which has now passed will increase our expenditure.

Rates.

16,805. At present, have the rates been fairly stationary?—They are not so high as they were 20 years ago. The poor rate is reduced.

Effect of the depression.

16,806. Owing to the depression there has been, of course, a largely diminished production?—Yes. The general production of the land has diminished, owing to the farmer s incapability of properly stocking and farming his land.

16,807. Owing to the great loss of capital, would you say, that he has sustained?—Yes; very many farmers now are in the hands of the dealer.

16,808. Are the new tenants that come in equally short of capital?—There are very few new tenants to come in. We do not find fresh blood come in at all; we find that the larger farmer now is falling back on a smaller occupation, and that the large farms are going into the hands of the owners.

Security of tenure.

16 809. Do you believe that the diminished production is at all owing to any sense of insecurity on the part of the tenant?—I do not see what better security he can have than he has now.

16,810. Is that the view of the tenant farmers themselves?—The tenant's fear is this, that prices should become lower than even they are now. He says "When are we coming to the bottom?"

16,811–12. But you do not think that they are really afraid of their improvements not being compensated for?—No; a farmer is fairly safe under the Agricultural Holdings Act, and under his lease or agreement I do not see what better security a farmer can have than he has at the present time.

The Agricultural Holdings Act.

16,813. Most properties in Norfolk are under the Agricultural Holdings Act, is not that so?—Every farm is under the Agricultural Holdings Act if a tenant thinks proper to put the Act into motion.

16,814. Have many claims been made?—Not very many.

Valuation.

16,815. Have you had considerable experience as a valuer under the Act?—I have.

16,816. How do you think it works?—I think where land is fairly farmed, where a tenant has done his duty to the land and to himself, that the Act works fairly.

16,817. Have many claims come from tenants who have farmed badly?—Tenants generally consult their professional man, their valuer. For instance, if a tenant came to me—(I have had three or four this year)—and said, "I want you to value for me because next "Michaelmas, I am going out, and I mean to make a "claim under the Act." My reply is, "Wait; you will "not make your claim till two months before the expi- "ration of your tenancy. Before you make your claim "I shall be pleased to visit your farm to look it over "to see the state and condition, and you must have "ready for me a statement of your last three years' "expenditure on cakes, manures, and feeding stuffs "on which you expect to be paid. I will then give "you my opinion whether it is desirable for you to "make out a claim or not." After my visit I can tell whether he has any chance of benefitting by making a claim.

16,818. Have you had much experience of claims?—I have had great experience in claims.

Mr. W. T. Simpson.
13 Apr. 1894.

16,819. That have been made on insufficient grounds?—I have as umpire.

Claims an counter-claims.

16,820. Do you think tenant farmers have an undue fear of counter-claims?—No, I do not think so at all.

16,821. Do you think where they are afraid of counter-claims that they have very good cause to be?—Yes. No man need fear the Act if he has been farming properly and doing his duty.

16,822. Would you amend the Act so as to make these counter-claims more precise?—Certain amendments are desirable. The great difficulty that we find in the counter-claims is to interpret the word "waste." The valuers in Norfolk have interpreted it to mean that waste shall include anything that is detrimental to the next tenant; that is to say, if a man leaves his land very full of couch grass, and he charges for the manure that has been put on to that land, a counter-claim is made therefor.

16,823. With regard to damage or neglect of buildings, what do you do?—The neglect of buildings comes in under a lease in nine cases out of ten. A tenant is bound either to pay half the labour or, as is the case in many instances now, the landlord does it all himself, so that a tenant has very little to fear on that ground. A man hiring a farm now will not agree to do anything to the buildings, he makes his landlord do it all; but where a man 20 years ago signed a lease agreeing to pay half the repairs, he is bound (whether he makes a claim under the Act or not) by that condition at the end of his lease.

16,824. Do you consider that the counter-claim should be made on the same day as the claim?—No. I think that the time named in the Act—the two months' previous notice—is fair for the tenant, and that a landlord should make his claim within a month of the receipt of such claim. I cannot go so far as Mr. Sewell Read, who said that the landlord must make it on the same day.

16,825. Do you think that if the counter-claim, was made on the same day the landlord, who would know the amount of the claim, would probably make a larger counter-claim than he otherwise would?—The landlord is guided by his valuer in this.

16,826. And he certainly would make a claim, whereas, at present, perhaps, he would not make any?—It is done in this way, as Mr. Read said, to bounce the tenant out of his claim; the opposing valuer will say, you have claimed 100*l.* on this farm as compensation, and will endeavour to make counter-claims greater in order to induce the tenant to withdraw his claim.

16,827. Do you think that is very much the case?—I daresay there are cases of that sort. I do not look upon it as a grievance myself, because we have always the umpire to fall back upon.

16,828. Do you know of large counter-claims being made, and of very little being awarded under them?—Yes. I have had experience in that way. I have had large counter-claims and given very little for them. On an estate in Cambridgeshire, last October, I was acting for the tenant on one farm and for the landlord on the other. I can give you the two instances. On the one farm of 370 acres a claim was made for 275*l.* 10*s.* 6*d.*, spent in cake during the last year of the tenancy. Under the rules which we, the eastern counties' valuers, act, we allow one-third of the cost of the cake consumed during the last year. In this instance I allowed a third of the cake—91*l.* 17*s.* The other feeding stuffs consumed on the farm were 40*l.* 5*s.* 6*d.*, for which one-sixth was allowed, amounting to 6*l.* 14*s.* 3*d.*

16,829. Under the rules?—Under our regulations. The cake consumed in 1891–92, that is the previous year, cost 386*l.* 15*s.* 6*d.*, and for that we allowed one-twelfth, namely, 32*l.* 4*s.* 7*d.* I may tell you that this land is not what we call very retentive; it is chalk subsoil. If the land had been more retentive we should have allowed a sixth part instead of a twelfth. The nature of the soil is taken into consideration; some lands retain the manures and the benefit of what is put into them more than others; for instance, a heavy clay soil retains it, but on a gravel or a sand it percolates through the soil, and on that class of land we only allow the unexhausted value for one year—the last year.

16,830. What was the general result of the arbitration?—The general result was that the claim made

Mr. W. T. Simpson. 13 Apr. 1894.

upon me was for 130*l.* 15*s.* 10*d.* I, on behalf of the landlord, claimed for 60 acres of very foul wheat stubble, 37*l.* 10*s.*; I claimed a manurial value on 10 tons of wheat-straw sold off, 6*l.* 5*s.*, and for 4 tons of hay sold off for which no return had been made, 5*l.*—that is the manurial value only, and for repairs which the tenant was bound to do under the lease, 23*l.* 7*s.* 9*d.*, making the total counter-claim 72*l.* 2*s.* 9*d.*, leaving a balance due to the tenant of 58*l.* 13*s.* 1*d.*

16,831. Was that all allowed?—That was all allowed independent of his tenant right including hay, roots, and other items according to lease.

16,832. Would the tillages and the crops come under the custom?—Under the custom or under the lease in all cases. Every county has a custom of its own, or nearly so.

16,833. Could you tell me the cost of these proceedings?—About five guineas to each side. On the next farm, 750 acres, I was the seller—I claimed for the consumption of cake for the year before last, that is for 1891–1892, 700*l.* 5*s.* 9*d.* I asked and I got one-twelfth of that amounting to 58*l.* 7*s.* 1*d.* For the year 1892–93, the last year of the holding, the cake and beans consumed cost 744*l.* 19*s.* 1*d.* for which I claimed 248*l.* 6*s.* 4*d.*, one-third. For lamb food consumed on the same farm, one-sixth the cost, 11*l.* 9*s.* 2*d.*; for oats fed to sheep, cost 150*l.*, one-sixth allowed, 25*l.* The total claim was 343*l.* 2*s.* 7*d.* on 700 acres of land.

16,834. What was awarded?—The counter-claim which I was bound to allow for the foul state of a certain wheat stubble was 23*l.* 2*s.* 6*d.*; for half cost of thatching a barn, 3*l.* 15*s.* 0*d.*; for general repairs, 23*l.* 2*s.* 0*d.*; for repairs to a mill which was attached to the farm, 25*l.*; and for clearing out a mill stream which had not been cleaned for 20 years, 25*l.*; making a total counter-claim in round figures of 100*l.* I got for my client 243*l.* clear as compensation for his improvements. I can quote one other case near Norwich. The claim in 1892–3 was for 39 tons of oil-cake costing 266*l.* 7*s.* 6*d.*, one-third was allowed namely 88*l.* 16*s.* 0*d.*, and for 15 tons of lamb food costing 92*l.* 10*s.* 7*d.*, for which one-sixth was allowed, namely 15*l.* 8*s.* 4*d.*; and for the cake consumed in the previous year one-sixth of the cost, 49*l.* 18*s.* 4*d.*, making a total claim of 154*l.* 2*s.* 8*d.* This was a very nice farm and had been well-cultivated, and no counter-claim was made.

16,835. Have you any objection to putting in those regulations of the Norfolk valuers?—Not at all. Here is a print of them (*handing in print*). (*See* Appendix III.)

16,836. Do you frequently act for tenants as well as for landlords?—Yes, quite as much on one side as on the other.

16,837. Have you any amendments to suggest in the Agricultural Holdings Act?—The only amendments are those I have suggested, namely, that the landlord should be bound to make his counter-claim within one month of the determination of the tenancy instead of 14 days after. My reason for wishing that is that if a tenant is aware of what his landlord demands, that gives him the opportunity of rectifying those complaints. If he had left a certain piece of wheat stubble very foul he has the opportunity of cleaning it before he leaves, or he has the opportunity of repairing a fence and doing certain repairs to the premises. But if he does not know of the landlord's claim until 14 days after, which is very frequently the case, then he has not the opportunity of putting those matters right. It would give the landlord and the tenant an opportunity of agreeing together without going to arbitration at all.

Compensation for home-grown produce.

16,838. Have you any other amendments to suggest?—The home-grown corn ought to be allowed. At the present low price we find it advantageous to grind wheat, barley, and other corn, instead of using so much cake and foreign productions.

16,839. How can the amount so consumed be ascertained?—It can only be ascertained by an account of it being kept regularly. It might be checked by the miller's book, or if ground upon the farm an accurate account must be kept.

16,840. But you must have some check upon the farmers' claim?—We must have some check upon it. I advise all my clients, if they intend to make use of the Act, to enter in a ledger a debtor and creditor account against their stock.

16,841. Still that is only the statement of one party?—Yes; one must rely upon his statement to a certain extent.

16,842. But how can you check it?—We can only check it by going through the number of stock kept with the bailiff or with the men who feed the stock. Of course there are difficulties.

Mr. W. T. Simpson. 13 Apr. 1894.

16,843. How far back would you go?—We go back for three years. We take a three years' average, as you will find by that print of our rules.

16,844. You will have to check the man's account of feeding in that way for the last three years?—Yes, if we have any doubt. There is a difficulty in it. It entails a great deal more work on the valuer; but it does seem hard that a man should not be able to use his own corn and to charge for it. The difficulty can be got over by exchanging or buying of your neighbour, and that is what we must do if the Act is not amended. Or we can sell to the merchant and buy it again.

16,845. Do you think you can have any better system than a basing of compensation upon actual outlay?—We cannot see the improvements. We cannot see what is in the land, so I do not see what other basis we can take but the actual outlay.

16,846. You do not agree with the suggested amendments of the Act that have emanated from the Norfolk Chamber of Agriculture, I understand?—I do not agree with all of them.

Compensation for high farming.

16,847. Such as compensation for high farming and clean and good cultivation?—I do not see how it is to be ascertained. It would be very good if you could carry it into practice, but that is impossible. So far as I can see, you must go on to a farm and take the condition and state the farm is in. But what is the necessity for it? A farmer now comes to you to hire a farm; he goes over it, and he says: "I have been over your "farm; it is so very foul and it is in such a bad con- "dition that I can only give you 10*s.* an acre for it." He takes the condition into consideration in hiring the farm. If he improves it he gets the benefit in increased production. He cannot expect to do anything or to recoup himself unless he farms in a proper manner.

Freedom of cultivation.

16,848. Do you consider that there should be freedom of cultivation?—Yes, if a man has a lease, but if he only takes it from year to year I do not think it is desirable to give entire freedom of cultivation.

16,849–50. Have you leases in Norfolk now?—Yes, we have a large number of leases.

16,851. Many new ones?—Not very many new ones. Farmers now are very fearful of putting their hands to a document. They would rather hire from year to year.

16,853. It would not do much good to the Norfolk farmer to be allowed to sell his hay or straw, would it?—It would in certain years. In a year like the present, when hay is at double the price it generally is, and straw the same, it is beneficial to sell it.

16,854. It has paid the cost of carriage this year?—Yes.

16,855. And it has paid it well?—Yes.

16,856. As a rule there is great difficulty in getting rid of your straw, is there not?—As a rule we could not sell it—it is unsaleable. The freight would be half as much as the value of the produce.

16,857. There is not much hay produced, is there?—Not beyond what is required on the farm. Many are large sheep farms, and there is not very much hay produced.

16,858. You would not give greater freedom of cultivation to the year-by-year tenant than is practically now allowed, would you?—No, because he can make his own bargain, as the landlord is only too anxious to let his farm.

16,859. (*Mr. Everett.*) The position is completely reversed to what it was 20 years ago?—Just so.

16,860. (*Viscount Cobham.*) As to the future do you see any prospect of an improved state of things?—The only hope that I can see is in reduced expenditure, reduced cost of production, and the hope of things reviving.

Cost of production.

16,861. The cost of production has already been considerably reduced, is that not so?—Certainly all feeding stuffs are much reduced. I have paid as high as 12*l.* for linseed cake, now I can buy at 8*l.*

16,862. Do you consider that any possible further reduction in the cost of production could meet the fall of prices?—I do not think there is anything to be done to meet it; but the more we can cut down the cost of

Mr. W. T. Simpson.
13 Apr. 1894.

production, the better able we shall be to meet foreign competition. I do not hold at all with the witness yesterday, who said, "Let the land baste itself." It is more than ever necessary to farm well, and to grow all we can.

Rent.

16,863. In many cases you consider that rents will have to fall still further?—I am afraid they will.

16,864. Until they reach a vanishing point?—On many estates they cannot get lower; being little more than the tithe.

Bad seasons.

16,865. (*Mr. Everett.*) In regard to the seasons, it struck me that Mr. Read, comparing his evidence with my own experience, gave us rather a dark view of the character of the seasons of the last 10 or 15 years, do you think that, on the whole, taking the last 15 years, the seasons have been below the average in productiveness?—No, not taking the 15 years. The last three years have been bad seasons, but the last 15 have not.

Foreign competition.

16,866. I notice that you ascribe the low prices to foreign competition; are you aware that for 30 years or so, after we were exposed to unrestricted foreign competition, farming was a very good business in Norfolk?—Yes.

18,867. It looks as if some other cause than foreign competition had affected prices?—We did not get the quantity of corn in then in proportion to what we do now. Every country is competing with us now. With our own capital railways are being made bringing every country nearer to us, so that we get so much more than we got 20 years ago.

16,868. Do you think developments of that kind have been going on faster in the last 10 years than was the case in the 30 years that first followed free trade?—I should think they have. I am only speaking casually as I have no statistics to prove it.

16,869. (*Captain Owen Thomas.*) Is the land as well cultivated by farmers, who have sufficient capital, as it was in previous years?—By those who have capital to do it.

16,870. But I suppose a large proportion of the land will suffer more where the land is farmed by tenants who really have no capital?—It is so.

Value of land.

16,871. You mentioned two or three farms which have considerably fallen in value, I suppose they have also deteriorated very much in quality and fertility?—No: it is in consequence of the decreased value of their produce.

16,872. And not of the decreased value of the land itself?—Certainly not; it is not due to the deterioration in the value of the land; it is the value of the produce that has deteriorated the fee simple value. The first farm to which I alluded is capable of growing 10 combs of wheat an acre; which 20 years ago would have been worth at the least 10*l.* an acre. But if you take 10 combs an acre of wheat now at 12*s.* a comb, that is 6*l.* an acre, which is 4*l.* less an acre on the wheat crop alone, that fully accounts, I think, for the great deterioration in the fee simple value of the land.

16,873. There has been an extraordinary fall then if the farms have deteriorated in proportion to the prices of wheat. I suppose, really, you would not get more than about one-fourth for those farms in these years of the price that they would have realised 20 years ago?—More than a fourth—some have fallen 50 per cent. and some have fallen only about 30 per cent.

Rates.

16,874. You also mentioned that some burdens on the land should be removed, what would you propose to remove?—I think that the rates press very heavily on the occupiers of the land, the poor rates and the highway rate particularly. A professional man earning say 500*l.* to 1,000*l.* a year, is rated on his house which costs him 30*l.* or 40*l.*, while a farmer is rated according to the rental of his farm a year. I think the rates should be equalised more according to income.

16,875. What is the system or mode which the assessment committee adopt in your district as regards farmers?—In my district they take the rent; that is the basis.

16,876. The rent?—Yes.

16,877. Is there any reduction for repairs?—They make a certain allowance—they take the gross rent, and they then make certain allowances, but the rent is taken as the basis in the union in which I am placed.

16,878. I suppose all farmers have had their assessments reduced in proportion to the reduction of rent?—Yes.

Mr W. T. Simpson.
13 Apr. 1894.

16,879. (*Mr. Dalton.*) What are the rates in the pound in your parish now in the aggregate?—About 3*s.*, as near as I can tell you, the highway rate, and poor rate, and county rate all together.

16,880. The poor rate has fallen, I think you say?—Yes.

16,881. In the pound?—Yes. I cannot tell you exactly what it is.

16,882. The cost of main roads does not come out of the highway rate, does it?—Partly.

16,883. Does it not come out of the county rate?—We only pay to the one fund, it is 3*s.* in the pound, or whatever it is, and that is all paid through one channel.

16,884. What I mean is that your highway rate, which is the rate which is raised by the surveyor, is a separate rate?—Yes.

16,885. Has that gone up or down?—It has gone down since the main road system came in—it is about half what it originally was.

16,886. Both your poor rate and your highway rate have gone down considerably?—Yes; it is the county rate which has rather gone up, owing to the extravagant expenditure on the main roads in Norfolk.

16,887. But you are better off in the poor and highway rates than before?—We are.

16,888. And yet you want now to be relieved of those, and to charge them on some other person?—Any little relief that you can give us we should be most thankful for.

16,889. Would it be fair to charge the highway rates on anything, except the land in the neighbourhood?—Those who use the roads should pay for them. Brewers and others pay but little towards the roads. I say those who use the roads should pay for them.

16,890. They use the main roads, do they not?—They use the roads and we pay for them.

16,891. Not the roads for which the highway rate is paid; the country lanes, they do not use those much?—Where there is a public-house they do, and the public-houses are not all on the main roads.

16,892. What is this professional man who is paying on 30*l.* a year in your district; have you got a case in your mind?—Yes, I have, a doctor.

16,893. Does he not pay on more than 30*l.* a year?—His house is assessed at 30*l.*

16,894. His house and premises?—Yes.

16,895. Is he making 1,000*l.* a year?—Take it at 700*l.*, or take it at 500*l.*

16,896. Such a man would usually pay on more than 30*l.* a year?—He would pay on the value of his house, whatever that is assessed at.

16,897. Would that not be usually more than 30*l.*?—No, not in country districts.

Profit and loss account.

16,898. In the profit and loss account of your farm that we had, is anything taken for the residence on the farm. Is any allowance made for that?—Yes.

16,899. And for the produce consumed on the farm?—Yes.

16,900. The loss, I think, was the greatest in the two last years, 450*l.* and 250*l.*?—I had heavier losses in 1879.

16,901. But in those years that you took it was the greatest in the two last years?—Yes.

Bad seasons.

16,902. Do you think that that loss was mainly the result of bad seasons?—No, I do not think it was; it was owing to the reduced price of the produce.

16,903. I quite understand that you got no interest on your money on account of the reduced price; but do you think the badness of the seasons caused the great loss on that land of 450*l.* and 250*l.* in those years?—It is not all attributable to the bad seasons; it is more attributable to the lower prices.

16,904. How much would you say was the loss due to the bad season. Could you calculate it?—Not more than half that. You may take it at 50 per cent.

Claims and counter-claims.

16,905. Do you think it would make much difference in the amount of the claims by landlord and tenant under the Agricultural Holdings Act if they were both

Mr. W. T. Simpson.
13 Apr. 1894.

made at the same time?—I do not see that it is possible for the landlord to make his claim at the same time.

16,906. If they are made in the dark and neither knows what the other is going to claim, do you think that will induce them to make a larger claim or a smaller one?—I cannot see what he is to make his claim on, until he has gone over the farm. Until he knows that the tenant is going to make a claim he does not take the trouble to see the state of the farm.

16,907. Then you do not advocate that they should make their claims both at the same time?—No, I say the landlord ought to have a month to prepare his claim. When the tenant makes his claim it would be impossible for the landlord to act, because the crops would be standing, and he could not see the condition of the land.

16,908. I understood that you thought they should both make their claims a month before?—No, I said the tenant should make his two months before as it now stands, and that the landlord should make his one month ago. I might add to that that they should both of them have an opportunity of amending their claims up to the 11th of October.

16,909. Or if the tenant has put anything right?—Yes.

16,910. (*Mr. Little.*) On that point I suppose you think some extension should be given to section 7, which provides that the notice and counter-notice shall state as far as reasonably may be the particulars and amount, do you think that is insufficient to cover the additional claim?—Yes, I think it is. In my own experience if a man gives me the quantity that he has consumed I say: "You will consume something more between now and "Michaelmas, add it on."

16,911. As a referee and valuer you would not consider that an extension of the claim so long as it was a claim of the same character?—I should consider it as being of the same character.

16,912. You would admit it?—I would admit it, certainly.

Profit and loss account.

16,913. You gave your account of profit and loss for recent years; could you tell me how much the loss in the last two years is due to the depreciation in the value of the stock?—I cannot say exactly.

16,914. Has there not been a considerable fall in the last two years in the value of the working stock on a farm, the horses, for instance?—Yes, generally speaking.

16,915. Do you, in making your valuation, put an actual market price?—I put an actual market price.

16,916. And you do not think that your balance-sheet is much affected by the difference in the value?—Not considerably.

16,917. Then it is a pure loss as a trading transaction?—It is.

16,918. You gave us the full amount of the produce sold in 1873, which comes to about 12*l.* 10*s.* an acre on the whole farm; can you contrast with that the total sales of produce in some recent years?—In 1893, the gross produce on the farm was 3,500*l.*; the labour and the cost in 1893 was 3,750*l.*, showing a loss of 250*l.*

16,919. Can you give me the total produce for 1892?—I do not know that I can, I have not the book here; the accounts are with the surveyor; but I have the figures for 1891.

16,920. Then take 1891?—The corn sold in 1891 was 1,802*l.*

16,921. What were the total sales?—The total sales were 3,880*l.*

16,922. In making up those accounts, is that the actual produce of the year, or is there some kind of produce left over?—It is the actual produce.

16,923. What is unsold is valued, I suppose?—No, the stock is valued and the corn is sold. I do not make up my account until the corn is all realised; they are actual figures.

16,924. Then it is a criterion of the actual value of the produce of the farm for those years?—It is the actual realisation, there is nothing guessed at.

Compensation for manures.

16,925. Where a tenant under your advice does not claim compensation under the Act does he get any compensation for cake and manure?—Except the additional value of the manure, he gets compensation for that.

Mr. W. T. Simpson.
13 Apr. 1894.

16,926. I suppose he elects to sacrifice anything that he might get because he knows his claim would be swallowed up?—Just so. In all cases where the manure is valued it is put at a lower price where the cake is charged for.

16,927. It is the usual thing in Norfolk to buy the manure of the outgoing tenant at the consuming value is it not?—Yes.

16,928. I understand that where cake has been used in the production of that manure you value it at a higher rate if the cake is not allowed for in another way?—Yes.

16,929. That is substantially fair, is it not?—Yes.

Compensation for home-grown produce.

16,930. Now with regard to home grown corn; you are in the habit of examining claims of that kind as to cakes and manures where there are two occupations, and as I understand you have often had to make inquiries of foremen and labourers and others as to how the food has been consumed?—Yes, I have often.

16,931. And you do not see any insuperable difficulty in arriving in ordinary cases at the amount of the home grown corn?—No, I do not.

16,932. I suppose that you would require proof?—I should not allow it without proof.

16,933. And a farmer who neglected to provide himself with the proof would lose?—He must take the consequences.

16,934. Though it is difficult you think it is not insuperable?—It throws more labour on to the valuer but it is not an insuperable difficulty.

Expense of arbitration.

16,935. We hear a great deal about the expenses of these arbitrations, are they not under the Agricultural Holdings Act rather minute investigations which require a good deal of time and a good many witnesses?—Yes, they are.

16,936. And a good deal of consideration?—Yes.

16,937. The expenses of an arbitration sometimes include beside the remuneration of the valuer sundry expenses which he has to incur?—Yes, such as witnesses.

16,938. He pays for witnesses?—Yes.

16,939. He generally has to feed them?—Yes.

16,940. If he is the umpire he entertains the two referees?—He does.

16,941. Therefore his bill of costs is not entirely remuneration to himself?—No.

16,942. (*Viscount Cobham.*) What is he paid per diem?—We have no fixed charge, it is according to the amount and trouble that we have.

16,943. (*Mr. Little.*) A valuation will sometimes occupy two or three days, it will take a valuer from home two or three days?—If it took me away three days I should not be satisfied to charge less than 20 or 25 guineas.

16,944. (*Mr. Gilmour.*) Would it not lessen that cost if the landlord and tenant were either bound to select one man to do the whole business or failing that——?—If I went as an umpire I should make the same charge, because I should have both sides to look at.

16,945. There would only be one man to be paid by both parties?—Yes, it would be divided between the two.

16,946. That would lessen the cost therefore?—Yes.

16,947. If there was a selection in every district of well-known men would that not be a workable plan, and a better plan for all?—Possibly it might.

16,948. Do you think so?—Possibly, but in nine cases out of ten the tenant pays the claim, although it is made upon the landlord; the tenant invariably has to pay, and he wishes to have his own valuer.

16,949. The tenant pays the claim?—In nine cases out of ten. The landlord, although he is liable for it, passes it on to the incoming tenant.

16,950. That is going against the spirit of this Act, is it not?—I do not know that. The Act says it is the increased value to the incoming tenant. In nine cases out of ten the landlord goes to the incoming tenant and says: "You have taken my farm; you will go in under "the Agricultural Holdings Act, and you will have "the same benefit when you go out."

Mr. W. T. Simpson. 13 Apr. 1894.

16,951. Are there any items in Schedule 1 which you would consider should be properly transferred to Schedule 2?—No. I do not consider that there are. I think the Act gives every protection.

The letting of farms.

16,952. (*Mr. Giffen.*) You told us that the present state of things is that the landlords submit to any sacrifices in order to keep a tenant?—Yes.

16,953. And I suppose they submit to sacrifices in order to obtain good tenants?—Yes, but they are not so very particular about that. If there is any chance of keeping a tenant on they hold him rather than run the risk of having their farms thrown on to their hands.

16,954. Surely if they have a farm to let they will make the same sacrifices to get a good tenant that they make to keep an existing tenant?—They very often make a greater sacrifice to a new tenant than to an old one.

16,955. That is to say, there are more landlords now seeking tenants than there are tenants seeking landlords, so that a tenant can pick and choose?—That is so.

Farming to a profit.

16,956. Is the tenant able to make a living at the rents that he gets under these conditions and with these prices?—It is a very precarious living, and I am very doubtful, if the present price of wheat and barley continues, whether a man will be able to make a fair living even at the reduced rent.

16,957. Would you not think that a tenant going into a new business like that, and able to put almost any terms he likes upon the landlord, would obtain terms which would make it pay himself, otherwise why does he go in?—It depends very much upon the man himself, whether he is a business man, and whether he has sufficient capital; that is the great point whether he has capital enough without borrowing.

16,958. Then some people can make it pay?—Some farmers may.

16,959. If they have capital enough?—Those who have money of their own and have not to pay bankers' interest. Where a man has to pay five or six per cent. to his banker it is a second rent.

16,960. A man that has adequate capital and is a good farmer going in upon these terms may make a fair living?—He may live.

16,961. That is all you would say, is it? You do not say he would make a fair living or a good profit?—I do not say he would make a good profit, he might live.

Difficulty in letting.

16,962. Why does a man who cannot make a good profit go in then? You say landlords will submit to any terms?—There are very few men who will go in at the present time, even at the low rent. We have no fresh blood, no strangers, no tradespeople, no men who have made their money in other businesses coming into farms as we had 10 or 20 years ago.

16,963. Then the willingness of landlords to make sacrifices does not attract tenants?—In certain districts, certainly not. I can point out large estates in Norfolk which are nearly all in the owners' hands, and the owners would gladly let them if they could get tenants.

Value of land.

16,964. (*Mr. Whitehead.*) You gave us instances of the depreciation in the value of the land; in one case you said that 1,400 acres, for which 60,000*l.* was given some time ago, you value at 30,000*l.* now?—I fear if it were now on the market it would not make more than 30,000*l.* to 35,000*l.*

16,965. In another case, 350 acres, which were bought at 22,000*l.*, you valued at 12,000*l.*?—Yes.

16,966. Could you tell me how you valued that land?—I take the present net rental at 20 years' purchase.

16,967. In each case?—Yes.

16,968. Although you know that if it were put up for sale there would be no actual sale of the land?—In nine cases out of ten the sale is fruitless, there is no investor.

16,969. Does that apply to a great deal of the land in Norfolk?—A great deal.

Dairying.

16,970. You say in your proof that all classes have suffered, but that dairy farmers, and those who breed and rear their own horses, cattle, sheep, and pigs, have best stood their ground. Will you tell me if dairy farming is increasing in Norfolk?—Not so much, because our land is not adapted for it—we have not sufficient pasture.

Mr. W. T. Simpson. 13 Apr. 1894.

16,971. Is the breeding of horses, cattle, sheep, and pigs increasing?—I do not think it is.

Horse-breeding.

16,972. Would that apply also to hackneys?—There are certain well-known hackney studs where people are doing pretty well, but the man who breeds the inferior or secondary hackneys is not making very much out of it.

16,973. Do you agree with Mr. Sewell Read that it is not desirable to encourage the extension of the breeding of hackneys in Norfolk?—No, I do not. I think it is desirable to improve the breed. I think it is quite desirable where a man has a good brood mare or two that he should breed the best he can.

16,973*a*. Do you agree with Mr. Read's opinion that there are a lot of bad ones?—Yes; there are a great many useless ones.

16,974. They do not select their sires and their dams properly?—That is it; they use anything.

16,975. They have good opportunities for properly breeding, have they not?—Yes, but there are certain men who will not pay the fees of a good horse. If they can get the service of a horse for two guineas they will not pay ten.

Poultry-farming.

16,976. With regard to the breeding of poultry in Norfolk, is that extending at all?—Yes, I think it is.

16,977. One reads of Norfolk fowls and Norfolk turkeys as if that were a large industry?—The poultry farming is increasing.

16,978. And does it pay?—I think it does where the farmer's wife or daughters look after it; it does not pay as a separate business; it would not pay me to breed poultry, because I must pay someone to attend to it; it pays those who look after it themselves.

16,979. That would be good work for the wives of the labourers, would it not?—Yes, it would.

Female labour.

16,980. I suppose it is because the work on arable land is so heavy that the women will not take it?—It is menial labour. I am not an advocate for it at all. I am very glad to see that they are gone from it. I do not think it a proper place for women.

16,981. In fruit-growing districts and hop-cultivating districts the labour of women is rather increasing than decreasing?—Yes, but they get much better pay for a short time; they make a harvest of it; it is different from everyday work on the land.

Sale by live-weight.

16,982. (*Sir Nigel Kingscote.*) What is your experience of your cattle, both fat and store, being sold by weight?—My experience at Bury St. Edmunds is that no farmers use the weighbridge; they do not care to use it. We have a weighing machine within 20 yards of our sale ground, but I do not think half a dozen cattle have been weighed since it was erected.

16,983. As a farmer, do you think it would be advantageous to use it?—I cannot see the advantage of it.

16,984. You do not?—I do not at all.

16,985. Do you think you, as a farmer, or farmers generally, can compete with the butchers in telling the value of a fat beast?—Perhaps I must speak rather personally here. I have a public sale, and I say in a public competition an animal is sure to find its value. I sell all my own live stock by auction, as well as other people's. I say, if there are 40 people round my ring they know the value of the animals better than I do.

16,986. You are sure of a market. Would not the price be equally great selling by auction if they were sold by weight as well?—I do not think so. There is a difference in the quality to be taken into account. It does away with a man's judgment; it does away with speculation, to a certain extent. There are many men who speculate and send their cattle to London, or to Birmingham; they buy on their own judgment, and they pay little attention to the scales.

16,987. Those are butchers and large dealers, I suppose?—Dealers.

16,988. Taking the tenant farmer generally do you think that his judgment can compete with those who are at work at it every day?—Very few farmers now sell their things at home; they cannot know the value of them. Every market town has its sale or its market, and they send to that market.

16,989. Then you see no advantage in selling by weight?—I do not at all personally. There is the

Mr. W. T. Simpson. 13 Apr. 1894.

difference in the quality, and the difference in the live and the dead weight, which varies very considerably according to the time a bullock has been grazing—whether a bullock has been grazing six months or three months—makes a great difference in the waste.

16,990. But when he is put upon the weighbridge that is told?—You cannot tell the depreciation upon the weighbridge; so much depends upon the grazing.

Tree planting.

16,991. To turn to another subject. You said there is a good deal of land gone into the landlord's hands in Norfolk and Suffolk. Is that chiefly the light land or the heavy?—The very light and the very heavy.

16,992. Is that land being properly cultivated?—It is only half farmed in many instances.

Mr. W. T. Simpson. 13 Apr. 1894.

16,993. Has any of it been planted?—There are some few cases of plantations.

16,994. Only a few acres?—A few, 20 or 30 acres here and there.

16,995. Do you think it would pay?—I do think it would. I think larch plantations would pay.

16,996. Or even Scotch fir?—That is so unsaleable; it is of so little value when it is grown.

The witness withdrew.

Adjourned to Thursday next at 12 o'clock.

Thirtieth Day.

Thursday, 19th April 1894.

PRESENT:

THE RIGHT HON. GEORGE JOHN SHAW-LEFEVRE, M.P. IN THE CHAIR.

Viscount COBHAM.
The Right Hon. HENRY CHAPLIN, M.P.
Sir ROBERT NIGEL FITZHARDINGE KINGSCOTE, K.C.B.
ROBERT GIFFEN, Esq., C.B.
CHARLES ISAAC ELTON, Esq., Q.C.
Captain OWEN THOMAS.
FRANCIS ALLSTON CHANNING, Esq., M.P.
JOHN CLAY, Esq.
CORNELIUS NEALE DALTON, Esq., C.B.
ROBERT LACEY EVERETT, Esq., M.P.
JOHN GILMOUR, Esq.
GEORGE LAMBERT, Esq., M.P.
WILLIAM CUTLACK LITTLE, Esq.
WALTER HUME LONG, Esq., M.P.
CHARLES WHITEHEAD, Esq., F.L.S.

HERBERT LYON, Esq., *Secretary.*
R. F. CRAWFORD, Esq., } *Assistant*
FREEMAN THOMAS, Esq., } *Secretaries.*

The Right Hon. Sir MASSEY LOPES, Bart., called and examined.

Right Hon. Sir M. Lopes, Bart. 19 Apr. 1894.

Right Hon. Sir M. Lopes, Bart. 19 Apr. 1894.

16,997. (*Chairman.*) You are the owner of a considerable estate in the South of Devonshire are you not?—Yes.

Description of property.

16,998. What is the extent of it?—I think it is about 8,000 or 9,000 acres of enclosed land, but there are large commons which I have the freehold of, and on which I allow the tenants to graze their stock.

16,999. Is the greater part of it let to tenants?—8,000 or 9,000 acres are let to tenants.

17,000. How much have you in hand yourself?—I have about 500 acres in hand.

17,001. Do you farm that yourself?—I farm that myself.

17,002. How many tenants have you got?—I am afraid I can hardly tell you, I should think about 70 or 80.

17,003. They are comparatively small farmers I suppose?—They are small farmers.

17,004. What do they average?—In value?

17,005. In acreage?—They vary very much, they would be from 50 to 250 acres, but the rent is from 50*l.* to 150*l.*

Small holdings.

17,006. Are small holdings at rather higher rents than the larger ones?—I do not think so. At all events the expenses connected with these smaller holdings are considerably larger in proportion to those in the bigger holdings.

17,007. Has there been any change in the size of the holdings of late?—No, I think not. It is quite impossible in poor land, which mine is, generally to let large farms. Unless a man has some land good with his poor land there would be no competition for it.

17,008. Do the smaller tenants make their livelihood entirely from the farms?—I think entirely from their farms.

17,009. What is the smallest acreage in which a tenant can make his livelihood?—That very much depends upon the nature of the land. As a rule the small farmers, in my opinion, are worse off than the labourers just now. If it was not for their own families the farmers would not be able to farm their own lands for they are not able to hire labour.

17,010. Is yours a dairy district?—No, there is very little dairy. It is too far from the towns.

17,011. How do they make their profits then?—By rearing cattle, that is the staple commodity.

Reduction of rent.

17,012. Has there been much reduction of rent?—About 15 per cent., I think, all round, and I should say that many of them are in arrear, and have not paid any rents.

17,013. You have had to make abatements and not to insist upon payment, I suppose?—Yes; that is besides a reduction of 15 per cent.

17,014. The permanent reduction has been about 15 per cent.?—I think so.

17,015. When did the permanent reduction begin?—About two years ago.

Existence of depression. Fall in prices.

17,016. Not until then?—No, I do not think we have felt the depression so much except during the last five years. When the last Royal Commission was held, I think what we then complained of was simply unfavourable seasons, but now it is a depression more especially in our district, in the price of cattle. I do not think cattle, during the last 12 months, have realised much more than half what they did five or six years ago, at any rate not store cattle.

17,017. You are now speaking of the last 12 months, but you say that the depression began to be felt about five years ago; did the price of cattle begin to fall then?—Not so much, but it has gradually become worse since that period.

Right Hon. Sir M. Lopes, Bart.

19 Apr. 1894.

17,018. Might not the fall of prices last year be due to the drought?—It helped very much to increase it.

17,019. It would be necessary to separate that from any more permanent reduction?—But it is the price of stock that is so injurious to the district of which I know most.

17,020. You cannot say when that began?—We did not hear much complaint before five or six years ago. Since then it has been gradually getting worse.

17,021. And what do you say about last year?—Last year there was no sale whatever for store cattle at all; farmers have taken them to market three or four times and they have never got a bid for them.

17,022. This was due to the drought?—Undoubtedly, that increased it.

17,023. Did they suffer much from the drought?—Very much.

The letting of farms.

17,024. When farms have become vacant have you had difficulty in re-letting them?—I do not think there is the same competition as there was. We give 14 years leases, and as a rule men go on for long periods, for generations I may say.

17,025. Have most of your tenants leases?—All of them.

17,026. And they still go on taking them?—Yes, leases of 14 years with a break at seven years. That is to say, a tenant can give notice at seven years, and I can give notice at seven years, but as a rule I never get or give a notice.

17,027. But have you been able to let your farms?—I have one or two in hand which I have not been able to let.

17,028. Is that from the absence of men with capital?—I think that the men in the district have scarcely any capital at all. Their capital is their stock.

17,029. At all events that represents capital?—To a certain extent, but they have no ready money, stock is their capital.

Condition of labourers.

17,030. I think you said that the labourers are better off than the very small farmers?—I think the condition of the labourer has very much improved of late years, his wages have very much increased.

17,031. Have you any cases of labourers who have risen into the position of small farmers?—I do not think so.

17,032. Not in your district?—Not in my district. We have had one or two instances, but they are exceptional.

Wages.

17,033. Have the wages of labourers been maintained or has there been some fall?—They have increased. Farmers have a great difficulty in getting labour. The agricultural labourer prefers going to the Railway, or into the Police, or any other occupation but that of agriculture.

17,034. Have the wages remained the same?—I think wages have increased. We have no labourers under 15*s.* a week.

17,035. Comparing the wages with those received 10 or 15 years ago, what are they?—They are higher, they used to be about 12*s.* a week. They are now 15*s.* per week and in many cases the man has his cottage free.

17,036. With the low price of food and meat and other food the 15*s.* goes much further than it used to go?—Yes, he has improved his position.

17,037. In spite of that you say that there is still a tendency to leave the country and go to the town?—Certainly.

Deterioration in farming.

17,038. Has the land in your district deteriorated from want of capital?—I think it has. Not only from want of capital but from want of labour. There is less labour employed on it.

Labour.

17,039. At what size of farm does the tenant begin to employ labour; I suppose on farms of 50 acres he does that himself?—Chiefly himself and his family. When he comes up to 100 and 150 acres he begins to employ labour, but if he can he prefers to keep a man in his house and his difficulty is to get boys. He cannot get boys and he is obliged to employ men in place of boys.

Assessment to rates.

17,040. Have the tenants derived the advantage of the reductions of the rent in the reductions of assessments and rating?—I do not think they have. I do not think agreements have been altered.

17,041. The assessments have not been lowered, you think?—I do not think they have in any case.

Right Hon. Sir M. Lopes, Bart.

19 Apr. 1894.

17,042. In respect of your farms that are in hand, what has been your experience of late years, have you lost money by them?—Decidedly.

Result of farming land in hand.

17,043. When did you begin to lose money?—I have been farming on and off a great number of years, and whenever an estate has fallen in hand and the tenant has left it, he has generally left it in a bad condition and I have generally tried to improve it and to let it again, so that my experience is a bad one.

17,044. I am thinking of the land that you have permanently in hand. I suppose you have a home farm?—I have lost considerably within the last two or three years.

17,045. Till then had you lost?—I had not so much before that.

17,046. When probably you have had land left in hand it has been in bad condition?—That is often the case. I have had a small home farm which I do not think has been very productive of late years.

Foreign competition.

17,047. What do you consider to be the cause of the depression?—I should put foreign competition as the chief one, which means the free importation of corn and cattle and wool. I should say that of wool, more especially in my district, because having very large commons the tenants have the privilege of turning out their stock on those commons and I can quite recollect when a man would make his rent off his wool, which was sold at 1*s.* 6*d.* to 2*s.* per pound, and now it is down to 6*d.* and 7*d.* per pound. I do not believe that the tenants, as a rule, sell any corn with me; they utilise it for their own cattle, so that the way in which they make their rent is rearing their stock and selling them as store cattle. I can give you my general experience upon my property. I have had it now nearly 40 years and I have expended more than 150,000*l.* upon it. I do not hesitate to say that the rental of it now is not more than when I inherited it, so that is sheer loss of capital to me. I believe if I had put that money into other securities I should be a vast deal better off at the present moment as far as my land is concerned.

Expenditure on improvements.

17,048. How was that money mainly spent, in drainage, or in buildings?—Chiefly in new buildings, repairs, and fencing, and different things. The property was very dilapidated when I succeeded to it, and my object was to improve it.

17,049. How much of that represents expenditure upon permanent improvement, apart from repairs?—I should think more than two thirds of it. Repairs are a big thing, it means putting a new roof upon a house, and you can hardly call that repairs. The increased cost of all agricultural buildings is very considerable. I am perfectly satisfied that I cannot build a farmhouse now as compared with 30 or 40 years ago, at less than 30 per cent. increase; everything has increased, and not only labour but material. Our difficulty is great now in building cottages. I had a case the other day. I wanted to build a block of two cottages. My estimate for that block was about 400*l.* We have now to send plans to the architect of the Union, and then to the sanitary officers, and these requirements almost make it deterrent. We cannot build a couple of good cottages under 400*l.*, that is with pigsties and appurtenances.

17,050. That is due to the increased requirements of the sanitary officers?—In a great measure.

17,051. When you speak of the materials having increased, what are the cottages built of, stone or brick?—Stone and slate; the price of slate has very much increased in our district, in fact the price of all materials has increased.

17,052. Has timber increased in price?—Timber, too. If you want to build a block of cottages for 400*l.* you have got to go to the Guardians, and you have to satisfy the sanitary officers with regard to the water supply and sewerage.

17,053. Have you much timber on your property?—Not so much now. The blizzard destroyed almost all of it two years ago.

17,054. Do you find that the price of timber has increased or decreased?—The price of timber has very much decreased since I recollect. I can recollect when oak was selling at 3*s.* a foot, and now you cannot get 1*s.* a foot. The high price was in a great measure owing to being near a dockyard; of course there was a

Right Hon. Sir M. Lopes, Bart.

19 Apr 1894.

demand for oak when it was used for shipbuilding, but now iron has taken its place.

17,055. You are speaking of oak timber?—I am speaking of oak timber.

17,056. You said just now that the timber for building purposes has increased? — That always was imported.

Cost of production.

17,057. Then as to the other causes of depression, do you consider the cost of production has increased?—I think the cost of production has decidedly increased by the increased cost of labour. It is almost impossible for a tenant with me now to get an agricultural labourer, they all go into the towns.

17,058. That, of course, tells upon the larger farmers, but it will not tell upon the small farmers who work their land themselves?—If a man has got his family he can manage to work the farm himself, if he has not a family he must then employ labour. Then I think one of the chief things is that charges upon the land are gradually increasing.

Rates.

17,059. Have you any figures which show what has happened in respect to the rates upon the land in your district?—I have no figures here, but I pretty well know; our rates have not decreased at all, although, of course, we have had a considerable sum lately in subventions, but the expense of County Councils, main roads, and different things, have almost neutralised all those advantages.

17,060. What is the average of your rates?—They vary very much in each parish. I should think on the average about 3*s.* to 3*s.* 6*d.*; they vary in every parish—in every union.

17,061. And you think there has been no diminution of them in spite of the subventions?—No, I think there is a prospect of a greater increase. The sanitary rate is becoming a very serious matter, and there is also the school rate. There are three adjoining parishes now in which there is a demand for building new schools.

17,062. Are these board schools in your parishes?—There was only a board school in one parish, but I am very much afraid they will all be board schools before long?

State loans.

17,063. What would you suggest as a remedy?—Well the first thing I would suggest is that the Government should grant some State loans at low interest to aid and assist in agricultural buildings, farmhouses and cottages. The next thing that I should suggest is one that I take considerable interest in.

17,064. In the case of your own expenditure on improvements have you provided money yourself, or have you got it through the loan societies?—I provided money myself, I have not gone to any society.

17,065. Do you think that if the State were to advance money on land with the privilege of extending the repayment over for a number of years that it would be much availed of in your district?—I think it would with small holders. That is if they were to advance it at a lower interest than building societies now advance it, which I think is about 6½ per cent.

17,066. And the other owners would avail themselves of it you think?—A great many of them would be very thankful for it.

Yeoman farmers.

17,067. Are there many small owners in your district?—There used to be a great number of yeomen there but they have been very much reduced of late years. The yeomen have sold their estates, and many of them tell me that it is much cheaper to sell their estates and rent them than own them.

17,068. Has the land been added to larger properties or bought by the smaller owners?—I think it has been cut up a good deal of it, many have been sold in small lots.

17,069. What are those small lots used for, are they used for farming purposes?—I think many of them are used for building villas where the district is suitable for them.

Rates. Maintenance of the poor and lunatics.

17,070. What is your next proposal?—The reduction of local burdens. I have taken a great deal of interest in that question, and I think we have a great grievance in respect to it. I mention three things more particularly. I think the cost of in-maintenance of the poor ought to be made certainly a national charge. The Government have the entire control of it just now. They appoint their inspectors and they lay down their own rules and regulations, and it is not in the power of the union to advance the salary of any official 5*l.* a year without going to the Local Government Board. Therefore really the guardians have very little power, and I need not tell you that from the days of Elizabeth to the present time the maintenance of the poor was always considered a charge upon the income of every individual. Personal property was always considered liable to it, and it is only by an annual exemption now passed by Parliament since 1840 that personal property is relieved from the maintenance of the poor.

Right Hon. Sir M. Lopes, Bart.

19 Apr. 1894.

17,071. Is your suggestion that the personal property of a particular district should be liable to rate or contribution to the expense of that district?—I think it would be far better if it was made an Imperial charge.

17,072. Then the management would be Imperial?—The management is Imperial now.

17,073. Not wholly?—Almost entirely.

17,074. That is to say the Local Government Board can give its consent or refuse its consent to the increase of salary, for instance, but it does not determine the matter?—They can do what they like.

17,075. The Local Government Board does not decide whether the particular person shall receive relief or not?—No; I speak more particularly with regard to in-maintenance. Then I would also mention lunatics. I think lunatics are a national calamity, and they ought to be a national responsibility, and, I think, as far back as 1846 a Committee of the House of Lords strongly advised and recommended that the whole cost of lunacy should be placed upon the Imperial Exchequer. I think it was in the year 1874 that I then induced the Government to pay 4*s.* towards the cost of each lunatic. That was then supposed to be half the cost of a lunatic, but since then the charges are very much increased, and I do not think that the average is much less than 11*s.* or 12*s.*, so that the Government are only paying 4*s.* as against 11*s.* or 12*s.* But my contention is that the Government should pay the whole cost of lunatics. The land does not make the lunatics.

17,076. You consider that the State should take over the management of the lunatics?—They take it now. We can do nothing in our lunatic asylum without the leave and license of the Inspector when he comes down.

17,077. You cannot add to it?—No, and he lays down the law as to what we are to do.

17,078. But the State does not determine whether a particular lunatic shall be taken charge of?—No.

17,079. Or take the actual management of the asylum?—No.

17,080. That still remains in the hands of the local people?—It is done by the magistrates to a certain extent; they determine whether a man shall be sent to a lunatic asylum or not. It is not only the cost of maintenance but the cost of the buildings. Take Devonshire alone, I think we have spent 140,000*l.* upon the Lunatic Asylum now, and the Lunacy Commissioners have just impressed upon us that it is absolutely necessary that we should increase that asylum; that is another large charge.

17,081. But the total seems to involve a very large increase of subventions, that is the direction rather?—Yes.

17,082. I did not understand you to say that the Government should take the management?—I should rather that the Government took them entirely, rather than give a subvention towards them.

17,083. You would prefer that the Government should take the whole management of the asylums?—Yes.

17,084. And of the indoor poor?—The indoor maintenance of the poor. Then another thing I would mention is the police. The police is becoming a very serious charge. As you know half the pay and clothing of the police is at present paid by the Government, but they give nothing towards the cost of building stations and miscellaneous expenses, which amount to a very considerable sum. But I contend that the police ought to be an Imperial charge. The land does not run away, but the police look after personal property; they are more useful for that purpose than anything connected with the land, and therefore I think that the personalty ought to pay towards them. Those are the three things which I would suggest it would be only fair and just should be transferred to the Imperial Exchequer.

Right Hon. Sir M. Lopes, Bart.

19 Apr. 1894.

The marking of foreign meat.

17,085. What further remedy do you suggest?—I mentioned the labelling of foreign meat, I think that that very much affects us in our district, as there is a large importation of foreign meat, more especially of dead meat, and I think it would be only fair that any one who sells that foreign meat should sell it either under a licence or label it. That would apply to other foreign products as well. Then there is the question of the protection from foreign disease.

17,086. Just one question upon that; would you apply the same process to all foreign imports?—In a great measure I would.

17,087. How far would you go?—We do it in butter now, but it is not effectually done.

17,088. What other things would you apply it to?—Those are the chief things, meat and butter, you cannot label eggs.

17,089. Would you include colonial meat?—Anything that is not English.

Cattle diseases.

17,090. Then with regard to protection from foreign disease?—I think that we ought to be protected more than we are from foreign disease. In our districts we depend solely upon the rearing of stock; if one animal is imported, we will say from Plymouth, and brings pleuro-pneumonia with it, which may be incubating for eight or nine months before it shows itself, and it is turned out on the commons with us, that one animal might affect the whole herd. On some of the commons there is something like 400 or 500, and more than 1,000 cattle altogether. The tenants all have the right or the greater part of them have the right of turning out the stock on Dartmoor and on the commons adjacent, so that one animal affected by disease would affect the whole of them.

17,091. The cattle are very free from disease at present?—We have had anthrax down there and a good deal of swine fever, but we have been free from pleuro-pneumonia.

17,092. Those diseases have not been imported, have they?—No, we cannot say that they have been imported.

Income tax.

17,093. Then what further do you recommend?—I think I might mention the proposed income tax upon net instead of gross income. I have no hesitation in saying that the 10 per cent. which it is proposed to give between the net and gross is infinitesimally small. I am perfectly certain in my estate the annual expenditure has never been less than 35 or 40 per cent. upon repairs, building, and upon maintenance, and I have had to pay income tax upon the gross receipts.

17,094. When you say 35 per cent. does that include expenditure on new buildings?—New buildings and repairs.

17,095. That would be hardly a deduction from the rent?—It is the difference between net and gross income.

17,096. Yes, but still as a general rule it would be an investment?—Well, but if I did not build and repair I should not be able to get any rent. Not only are there new buildings and repairs but there is the management to be considered. There is the insurance, there are bad debts, and whether I receive rent or not I have to pay income tax upon it.

17,097. What further have you to suggest?—I think we ought to pay only on what we receive.

17,098. The landowner do you mean?—Yes.

17,099. Then as regards the tenant?—Well the tenant is supposed to pay as profit half of his rent, and I think that is rather severe upon him. I think, if I am right, in Ireland and Scotland they only pay upon one-third and I do not know why there should be that distinction in England. I am perfectly certain of this, that the west of England of late years has suffered much more than Ireland or the north of England.

17,100. You are aware, of course, that the farmer can claim to pay upon his actual profits and not upon one-half?—I think now his income tax is put upon half his rent, and he is supposed to go before the Income Tax Commissioners.

17,101. He could claim to be assessed upon his actual profits, if he has made none he will pay nothing?—As a rule he does not know this, and does not do it.

17,102. But still if he was informed of the state of the law he might do it?—It is very recently that he has had that information.

17,103. Have you yourself claimed the reduction?—No, I have not.

Right Hon. Sir M. Lopes Bart.

19 Apr. 1894.

17,104. Although you have not made the half of your rent?—Just so; I shall do so in future.

17,105. You cannot expect your tenants to know the law when you do not act upon it yourself?—No, I cannot.

Rates.

17,106. Is there anything else you would desire to say?—I mentioned with regard to leases and division of rates, I should say this, that I have always advocated a division of rates between landlord and tenant and I practise it. I divide all rates with my tenantry and I pay the whole of my game rate myself.

Leases and yearly agreements.

17,107. We have heard generally from other parts of England that the system of leases has been given up and the tenants prefer to have their farms from year to year—that does not seem to be the case with you?—I think that it is bad for both landlord and tenant, and I think that the tenant ought to have the security of a lease of his farm, and if I was farming as a tenant I should infinitely prefer to have a lease.

17,108. But owing to the uncertainty of future prices the tenants in other districts have ceased to be willing to take leases?—That has not been the case in my district—they have taken them.

17,109. That would tend to show in your district that there is greater confidence in the future?—Greater confidence in the landlord

17,110. In getting temporary abatements; do you mean that?—In my own case I can only say that the tenants have gone on for generations from father to son. If a tenant wishes to put his eldest son on the farm directly he comes of age he has his name added to the lease.

17,111. In other districts they have a system of yearly tenancies and the tenants prefer not to bind themselves for so long as 14 years?—With me it is 7 or 14 years. The tenant has power to give me notice, and I have power to give him notice at the end of the seven years.

17,112. At all events there will be some greater confidence in the farmers in your district with regard to the future than in other districts?—I hope so.

17,113. Do the neighbouring land owners give leases?—I think so, generally.

17,114. It is generally the custom of the country?—I think it is.

17,115. (*Mr. Elton.*) And the introduction of that hereditary benefit, of course, makes it better than an ordinary lease. It makes it into a kind of customary holding?—I think they have confidence under it.

17,116. That sort of usage is an additional benefit, undoubtedly?—I think it is.

17,117. You told us about the commons; are they near Dartmoor?—Yes, adjoining.

Small holders.

17,118. Then the small holders, of course, would have the addition of very large benefits, generally, on the great Dartmoor waste?—All the tenants have the power of turning out their stock in summer, and the general rule is that they may turn out as much stock in summer as they can keep in winter, and it enables a man to keep much more stock than he would otherwise be able to do.

17,119. And they keep to the stint?—Yes.

17,120. It would not make so much difference to a cottager, or a very minute holder having the run of the waste, because he would be restricted to one or two animals?—He would have no power to do it; unless the power was given him, he would not have the privilege.

17,121. I mean in some parts of the country the small cottagers used to be allowed to over-exceed their rights a great deal, but Dartmoor is well looked after?—Yes, they drive all the cattle at certain periods of the year into a pound, and they find out to whom they belong, and they fine those who have no right to be there.

17,122. That would have nothing to do with you, but that would be done by the duchy officers?—Yes, the duchy officers.

17,123. Do you have many of those cottagers who have small holdings attached to their cottages of 9 or 10 acres?—In the small hamlets, we always try to have two or three men who have got a little pasture land, so

Right Hon. Sir M. Lopes, Bart.

19 Apr. 1894.

as to be able to provide milk and butter for the people in the district.

17,124. Do these men live as labourers, or what?—They are dairymen in a small way.

17,125. Do your farmers adopt the west country system of sub-letting the cows?—No, they do not.

Wages.

17,126. You say that the price of wages has gone up to 15*s.*; is that for the ordinary day labourer?—We can get no labour of any kind for less than that.

17,127. Is that because you have the dockyard near?—I think the dockyard being near us has something to do with it, but there is a great deal of work always going on for the Corporation of Plymouth, and they employ a great many labourers.

17,128. I ask this question because the wages are very much higher than they are a few miles away?—I have never paid less than 15*s.* myself for labour.

17,129. It is very high for that part. You say that farmers use their corn on the farm?—Yes, they entirely use their corn in feeding their own stock.

17,130. Do they use much foreign barley?—I do not think they do much.

17,131. You have not heard them talk much about making exceptions in favour of the importation of cheap foreign barley?—No, I think not, they use maize a great deal.

Railway rates.

17,132. Do they make any complaint as to the charges for corn; are the railway rates satisfactory?—I think the railway rates are satisfactory. I have heard no complaints.

17,133. Have you heard complaints in your part of the small holders being hampered by having to pay on a heavier scale of railway rates?—I have not heard any complaints.

17,134. I only ask you because we have had complaints from other parts?—I think not in our district.

17,135. The main business of your tenants, you said, was to rear stock; do you rear young stock?—Yes.

17,136. Do they sell lambs and calves?—They sell chiefly store cattle and sheep.

Expenditure on improvements.

17,137. As to the increased expense of building farm houses that you spoke of, is that because they have more sitting rooms, and a higher style of living is required?—We cannot build a farmhouse under 500*l.*, and that provides very moderate accommodation.

17,138. But then that house would have a good deal better accommodation, at any rate, larger accommodation than the old west country farmer had?—I think the accommodation has improved; some of the buildings there were nothing better than hovels formerly.

17,139. They had a custom of using mud, and cob, and thatch?—But now we have substituted slates for thatch, which, of course, has relieved the tenant very much.

Maintenance of lunatics.

17,140. You were speaking of the amount of lunatic expenditure. I do not know whether you know anything about the neighbouring county; are you aware that Somersetshire has had an enormous expenditure on the lunatic asylum?—I do not know about Somersetshire.

17,141. You do not hold any property there?—No.

17,142. Should you consider that the ordinary legal view is the correct one, that lunacy is permanently under the Crown and the Chancellor?—Decidedly, I think the Government have the whole control of the lunatics.

17,143. Whereas the administration of the minor officials on the spot seems now to be regarded as if they were the prime organisers of the whole thing?—Yes.

17,144. You prefer the latter view?—Yes.

Rates. Annual Exemption Act.

17,145. (*Mr. Everett.*) You mentioned just now, as I understand, that an Act was annually passed to relieve personal property from liability to rating; will you kindly give us an explanation of that?—I think you will find that up to 1840 personal property had to pay towards what we consider the national expenses, including poor and everything. I think personal property was liable and was rated, but since 1840 there has been an Annual Exemption Act passed every year at the end of the session, which has exempted personal property.

17,146. Is it not the fact that in 1880, Parliament altered that annual Act and substituted for it a permanent Act relieving personal property?—I was not aware that the Act had been revoked. I am not quite sure, but I fancy that it is not so.

Right Hon. Sir M. Lopes, Bart.

19 Apr. 1894.

17,147. But you are confident that for many years, there was an Act passed annually in order to relieve personal property?—Undoubtedly.

17,148. You, I think, made a motion in the House of Commons, which was carried by a majority of 100 in favour of increasing the contribution from personal property to the rates?—I did.

17,149. That was during one of Mr. Gladstone's administrations?—Yes.

17,150. Since the passing of that Act very considerable grants have been made from personal property in relief of the rates?—Yes.

17,151. But not to the whole extent of the demands made by your motion?—I think I made three demands, one, that the administration of justice was to be transferred; the other was half the police; and the other was half the cost of the lunatics. Those three were granted, I recollect that at that time there were 116 prisons, and I ventured to say that half that number might do everything that was needed and required, and that has been found to be the case, and there are now only 56 prisons.

17,152. Do you remember what year it was that that motion was carried or under what Government it was carried?—It was carried in 1872 by Lord Beaconsfield's Government.

17,153. Notwithstanding that considerable grants have been made in aid of the rates from personal property it is still the case is it not, that the agricultural patient has got worse, instead of better?—I think it is the case.

Foreign competition.

17,154. In your evidence you said that in your opinion, foreign competition was the main cause of our difficulties; am I right in assuming that you mean low prices?—Undoubtedly; that has been the result.

17,155. And low prices you attribute to foreign competition?—Yes.

17,156. Has your attention been called to the fact that after we had been exposed to foreign competition for 30 years, agriculture looked back upon a quarter of a century of greater prosperity than it had enjoyed at any time in this century?—Yes; but I think we have only of late years keenly felt the effect of foreign competition. The quantity of imported dead meat which has so much increased every year has very much affected the British agriculturist. I do not think that the number of live cattle that come in is so important as the enormous increased quantity of dead meat.

17,157. You are aware, I daresay, that the average price of corn as shown by the tithe averages had reached a higher figure after we had 30 years of free trade than it has ever reached since the tithe has been commuted?—I think the tithe was up to 112*l.* at the time you speak of; but I do not think that we had felt the results of foreign competition.

17,158. Surely 30 years ago it was enough for that?—I do not think it was up to that amount 30 years ago.

17,159. But 30 years after we had free trade, that would be in 1879, the tithe was at the highest, that is more than 30 years, after the opening of the ports?—I think we were always told when we passed free trade that the freight would be equivalent to protection, and I think Mr. Cobden told us that the freight would be 10*s.* per quarter, and we find now that it is brought over as ballast.

The currency.

17,160. Has your attention been called at all to the connexion between the supply of money and the general level of prices at any particular time?—I think you are speaking of bimetallism and I am no authority upon that question. I can only say that the more gold you have, of course it would help very much the price of agricultural produce. All we know is that when we had large quantities of gold from California it tended very much to agricultural prosperity; but I am afraid that I do not know sufficient of bimetallism to go into the question.

Rates.

17,161. (*Mr. Lambert.*) I wish to know the purport of the Annual Exemption Act of 1840. Before that Annual Exemption Act was passed to what extent was personalty rated?—I believe all personalty was liable to be rated before that. There was a law case, I forget it now, which certainly gave a decision in favour of the rating of personal property, and it was only after 1840 that the Annual Exemption Act was passed.

Right Hon. Sir M. Lopes, Bart.
19 Apr. 1894.

17,162. (*Mr. Elton.*) You are referring, of course, to the great Act of Elizabeth, which started poor law relief, so that every man was to be rated according to his ability without making a distinction between personalty and realty?—Yes, according to his income and ability.

17,163. And after a period of desuetude it was found that that was a living enactment, and then suspending Acts were passed?—Yes.

17,164. (*Mr. Dalton.*) But the rating on that system was a dead letter before 1840, was it not?—I understood that the decision was that personalty could be rated and was liable to the rating to the poor.

17,165. The question is, was it rated?—I think it was. I think in some counties, I will take Wiltshire, certainly the clothiers were rated there—the cloth manufacturers—because I know that to be a fact.

17,166. (*Mr. Lambert.*) When this Annual Exemption Act was passed, were they relieving the clothiers?—Everybody was relieved, all personal property was relieved.

17,167. I did not quite catch your answer; was the Act practically a dead letter before 1840?—I do not think it was.

17,168. So that there was a considerable relief?—I think there was.

17,169. You could not instance any relief granted under that Act?—I know that to be the fact with regard to the looms in Wiltshire; they were rated.

Notice to quit.

17,170. You regard security from notice to quit, that is security to the tenant under the security of lease, as important to the fertile cultivation of the soil?—I think the greater security you can give to the tenant the more likely he is to put his capital into it and take an interest in his farm, especially when he hopes it to be hereditary.

17,171. Would you favour a six months' notice to quit?—No, I think not.

Dairying.

17,172. Do you think there can be any extension in the direction of producing dairy produce in Devonshire?—I think in the neighbourhood of large towns; there, of course, you have great facilities for it, but in my particular district we have very little land adapted for it—I can speak more especially for that district between Plymouth and Tavistock, two large towns—every one of our tenants has a small dairy; it is only really a small portion of his occupation, but I do not think we can increase that on poor land. We find in our land, that if it is out say three years it is nothing but moss, the grasses die out, and we are obliged to renew it.

17,173. But I was thinking of the plan of Co-operative Dairies and Co-operative Creameries which have been used and carried on in Ireland with considerable success. I want to know your opinion as a practical man whether such an extension can be made to pay in Devonshire?—I think where you can do it it might be desirable, but if you make all into dairy farms you will bring down the prices.

17,174. Remember that there are 12¾ million lbs. of butter imported into the country, so that there is a considerable opening for enterprise?—I am afraid the same thing holds good with regard to fruit; a great number of people are going in for it, and I am afraid that will be overdone.

Free cultivation.

17,175. Do you allow your tenants free cultivation under your leases?—We never interfere with a good tenant; he has certain allowances under his lease; he has allowances for different manures.

17,176. I presume the Agricultural Holdings Act does not affect your tenants?—I do not think it has affected them at all.

The letting of farms.

17,177. What would be the best sized, or the most desirable sized farm to let?—It would be impossible to let a large farm in our district, and as a rule you cannot let a large farm on poor land; unless you have a certain quantity of good land with it.

17,178. What would be the most desirable size?—That very much depends upon the man and his family. If he has got two or three sons he can farm a larger place than if he were entirely by himself. If he has not that assistance he is obliged to substitute labour at great expense.

17,179. Would you give us an estimate of what you consider a most desirable farm?—I think if a man farms 100 acres.——

17,180. At what rental?—That depends upon the land.

Right Hon. Sir M. Lopes, Bart.
19 Apr. 1894.

17,181. I want to know what would be an average?—It very much depends upon whether there is much pasture land or not, or whether there are orchards.

17,182. How many applications would you get for a farm of 100 acres at 100*l.* a year rent for instance?—Very few now to what they were five or six years ago, there is not the same competition for farms that there was.

17,183. But I presume although there may be greater difficulty, there is at all events an opportunity of letting farms in Devonshire at a reduced rent?—Up to the present we have had no difficulty we have let whenever we have had anything to let, but I am not so hopeful as to the future.

17,184. And the rents are decreased about 15 per cent.?—That is about the rule, but then all that depends upon what outlay you have made upon the buildings, because that has to be considered.

17,185. I presume you take that into consideration in making the estimate?—Yes.

17,186. Agricultural produce would have depreciated more than 15 per cent.?—Very much more.

Ground game.

17,187. Touching the Ground Game Act; do you give your tenant the right to kill ground game under the Act; of course you are bound under the Act to do so, but do you give them free facility under the Ground Game Act?—Yes, they have every facility to destroy ground game.

17,188. (*Mr. Dalton.*) You consider the increased charges on land to be one of the causes of the agricultural depression?—Yes.

Rates.

17,189. Are you quite sure of that, for the rate in the pound, taking Devonshire as a whole, has gone down. According to Mr. Fowler's return last year, taking the rural rate as compared with 1868, there had been a fall of about 6*d.* in the £, taking the whole rural rates?—We find under the County Council our expenses are very rapidly increasing; our main roads especially are a serious matter. There is scarcely one expense that has not increased. Take the coroners, and take registration, education, and sanitary, and weight and measures; increased demands have been lately made by the Government on all these subjects, and they have increased very much, and I doubt very much whether we have gained anything by the recent subventions; that is to say, having regard to our expenses previous to the time that the Local Government Act was passed, I say even with the subventions we have gained nothing at all by them.

17,190. Has not the poor rate gone down?—Very little indeed.

17,191. Can you say to what extent the poor rate has gone down?—I cannot.

17,192. If you go back as far as 1868 it has gone down very considerably?—That might be.

Maintenance of the poor.

17,193. What do you think would be the effect on out-relief if in-maintenance was made a national charge, Who would determine whether a pauper should be relieved outside or inside the workhouse?—I admit that there would be a little discretion with regard to that.

17,194. Would you leave the discretion with the local people?—I think you must, to a certain extent, leave it with them. But then there would be always a central office; they would be continually coming down and making inquiries.

17,195. But at the present time the central office has nothing whatever to do with the question whether a particular pauper shall have outdoor or indoor relief?—I should not have the least hesitation in giving them that power.

17,196. Would it not be impossible for a central authority to undertake work of that kind?—I do not think there is any advantage in the poor being brought into the house; and I do not think that they feel it so. The general feeling is to be out of the house rather than in it.

17,197. But would not there be an inclination on the part of the local authority if the whole of the expenses of the in-maintenance were borne by the Government, to send the pauper into the workhouse, rather than keep him out, if they had to bear the whole of the cost of the out-relief?—I do not think they would have any object in doing it.

Right Hon. Sir M. Lopes, Bart.

19 Apr. 1894.

Cost of the police.

17,198. They would have a pecuniary object in doing it?—I do not think that would affect them.

17,199. Then with regard to the cost of the police, do you think it would be generally popular if the Government were to undertake the whole charge of the police?—I do not think it would be unpopular.

17,200. Not in boroughs?—I do not know about the boroughs; I am not connected with a borough. As far as I can judge I do not see why it should be so. They would be very glad to be relieved of their rates.

Rates.

17,201. There are certain classes of personalty that now contribute to the rates, railways, gas, and water undertakings, canals, and so forth?—Railways pay their share to the rates.

17,202. A considerable share?—Yes; but the hardship with regard to railways is this: that the debenture holder, and the preference holder, pays nothing; the ordinary shareholder pays all the rates; he has constructed the whole undertaking, and the mortgagee, who is really the debenture holder, pays nothing whatever in any shape or form.

17,203. In the case of subventions which are very large now; they contribute towards those?—I think the subventions more recently made amount to something like 4,000,000*l.*

17,204. Taking all the subventions together?—Well, previous to that there were 2,000,000*l.*; that is about 6,000,000*l.*; I think we have a great case with regard to the reduction of the rates. Mr. Goschen, who was then the head of the Local Government Board, was my chief opponent years ago, and he is the very man who has given us 4,000,000*l.* since, and he has found out that probably he made a mistake.

17,205. Do you think that the subventions increase the local expenditure?—I do not think so.

17,206. Do you think it has made the local authorities extravagant?—I will not say that, but we are not a bit better off with those subventions than before we had them, because all the charges have increased. I think that the county councils have added very much to the charges, and I think parish councils will very much increase them by and bye.

17,207. On the whole you will not say that the rate in the pound of the poor rate has gone up?—It includes so many things.

17,208. Do you think it has gone up including the county rate?—I think it has. Our county rate increased last year.

17,209. What is it in the pound now?—I should not like to give you an answer, for I am not perfectly satisfied that I have the right figure.

Maintenance of lunatics.

17,210. There would, of course, be very great difficulty in a central authority undertaking the workhouses?—There might be some difficulty; there would be no difficulty with regard to lunatics.

17,211. With regard to the asylums, would there be?—No.

17,212. They could hardly take the one without the other, because there would be then a great inclination to send all the lunatics into the asylums, which has been very much complained of in certain districts since the 4*s.* grant was given?—I do not think that is the case.

17,213. It is a disputed matter, is it not?—So different is that the case that only recently the Lunacy Committee in my county have been obliged to send circulars to the unions requesting the guardians not to send any more lunatics there, because they have no room to receive them.

17,214. Is there not some disposition on the part of boards of guardians to send not only the acute cases but the aged to the asylums?—I am speaking only of two unions, and I do not think that is the case in Plymton or Tavistock.

17,215. You advocate loans by the Government for building farmhouses and labourers' cottages. Do you think that would be better than loans advanced by the local authorities? There was a Bill brought in last year with that object enabling local authorities to advance loans, and it was read a second time. Do you think that the principle of State loans is better than that of local loan societies?—Yes; we are piling up a local debt, and I think our local debt will be something like a national debt the way we have been going on recently. We have got something like 200,000,000*l.* now of local debt, and the way in which we are increasing it is very alarming.

Right Hon. Sir M. Lopes, Bart.

19 Apr. 1894.

17,216. Do you think you would require good security if you advanced it?—You have got the security of the State.

17,217. Is not the local authority more likely to be able to find out quickly and accurately whether the security is good or not, and if so, there would be no loss in their advancing the money as they would lend it on good security?—I would infinitely prefer the security of the State to that of the local authority.

Scarcity of labour.

17,218. (*Mr. Little.*) You spoke of a scarcity of labour in your district; does that remark apply generally to Devonshire, or only to your particular locality?—I can only speak of my own particular district in Devonshire. But in Wiltshire; I know Wiltshire, and I think that it is the same there. The great difficulty is to get rural labour.

17,219. Is that produced by migration of the labourers?—We find that they prefer to go as porters to the railways, or gangers, or railway guards, to the police, or dockyards, and in fact any other occupation, where there is not such hard work.

17,220. They have gone from the district; they are not taken up by any other industry in the neighbourhood?—A great many of them have left the district.

17,221. I suppose there is a contraction of work, less work done, and less labour required?—I think you want three labourers to get through the same amount of work that two used to do. I think everything has deteriorated, not only in quantity, but in quality.

17,222. Is there as much work done on the farm as there was?—I do not think there are so many improvements done. If you look at the fences and gates as you go along the railway you will see that that is so, and in my own district I do not think they are cared for as they used to be.

17,223. If there is a contraction of the amount of work and there is a scarcity of hands, there must have been a very considerable decrease in the number of labourers or in the amount of work done?—Yes.

17,224. Do you think that the state of the cottages has led the people to leave the country?—No, I think they prefer going into the towns. My own experience is that if you have a single cottage people do not care to go into it; they prefer to be near a market, near a neighbour and where they can get perhaps a little more recreation, and that is the great object of their going into a town. A man would rather live in a small room with his family in a town than have a comfortable cottage in the country.

Cottage building.

17,225. You were speaking of the cost of building cottages. New cottages are still necessary, notwithstanding the decrease of population?—Yes.

17,226. And you spoke of the requirements of the sanitary authorities as deterring landlords from building; are you under a Rural or an Urban Sanitary Authority?—A Rural Sanitary Authority.

17,227. And they require plans of cottages to be approved by them?—Yes, we are obliged to send plans in to them, and after that they go to the Sanitary Officer, and we are obliged to get water and sewerage, and we get many requirements that are not needful or necessary.

17,228. Can you tell me how the Rural Sanitary Authorities acquire these powers?—They have got them lately.

17,229. The Rural Sanitary Authorities can acquire powers which Urban Sanitary Authorities already possess?—I think that is possible; at any rate they have got them in my neighbourhood.

17,230. I think you said that a pair of cottages would cost 400*l.* independently of the land?—Land and water.

17,231. Drainage, water, fencing, and all those appurtenances; and what would that cottage let for?—4*l.* or 5*l.* is the most you can get for a labourer's cottage.

17,232. And as an investment there is no inducement to build?—None whatever.

17,233. And yet good cottages are very much required?—You cannot induce a labourer to occupy anything but a good cottage.

State loans.

17,234. Under these circumstances you think that a loan might be asked for from the State on easier terms than those of private companies?—I think it would be very advantageous to have such loans.

17,235. Do you know the terms upon which Government lends money to the Irish local authorities for building cottages?—I do not.

17,236. They allow the loan to be spread over 50 years, and the annual payment is a little under 4¼ per cent. That would be much more favourable terms than you could get from improvement companies?—Yes.

17,237. I understand that you advocate, and always have advocated, a revision of the local taxation as a matter of justice, quite apart from any increase of the burden?—Quite so.

Maintenance of the poor.

17,238. The in-maintenance of the poor as a State charge was recommended by the Duke of Richmond's Commission?—It was.

17,239. And do you think that it would be just, and that it would be economical?—I think it would be; there is no reason why it should not be.

Cost of the police.

17,240. The police you look upon as properly an Imperial charge for the benefit of all, and especially of the ratepayers?—More particularly for the benefit of personal property than of land.

17,241. And the cost for this in country districts falls entirely, or chiefly, upon the land?—Yes, except what is now paid by the Government.

17,242. Mr. Dalton asked about subventions and personal property, but does not real property contribute to both?—Just so.

17,243. Therefore, real property not only pays rates, but contributes towards the subventions?—Yes.

17,244. Do you not think that the police could be more economically managed if they were one force?—I hardly like to give an opinion about that.

17,245. As in the case of prisons?—If it was entirely under one control, that might be possible, now you have got a chief constable in each county. If there was a general superintendence of them, and a general management, it might be more economical.

17,246. The opportunities of promotion would be much greater in a large force?—Yes, that would be so.

17,247. And there would be better opportunities of securing good men and keeping them?—Yes.

17,248. The difficulties of superannuation would be decreased, perhaps by putting it on one uniform scale?—Yes.

Maintenance of lunatics.

17,249. Then with regard to lunatics; the visitors of the lunatic asylums have little power in administration?—None at all.

17,250. Everything they have to do is prescribed for them?—Yes.

17,251. The diet and indeed the whole management?—Yes, everything is laid down, and there is very little option.

17,252. And you argue that lunatics are properly a charge upon the whole property of the country, and not simply upon real property?—That is my opinion.

Sanitary rates.

17,253. Then with regard to sanitary rates; are you of opinion that they should be borne to a greater extent by personal property than they are?—When Mr. Stansfield brought forward that Bill some years ago I rather opposed it because this was a charge upon real property as distinct from personal and he then agreed to pay one half of the salaries of the Inspectors and the Sanitary Officers and that is now paid by the Government; but still that is a very small proportion of it.

17,254. The cost of administration is to a certain extent borne by the State but not the cost of the work to be carried out?—No.

School rates.

17,255. With regard to education you argue that that is entirely for the national benefit?—Yes. Well I consider that that is a very considerable grievance with us because it is now only a question of time when all our voluntary schools will be made into board schools. The Department are putting such very strong and stringent conditions upon us. As I said just now I am connected with three parishes where they are obliged to build new schools and they will be a very considerable expense.

17,256. That is an additional burden upon the land which it is at present unable to bear?—Yes.

Payment of compensation.

17,257. (*Mr. Gilmour.*) I think that you said that the Agricultural Holdings Act was not enforced in your district?—I think not, I do not think that it is utilised at all.

17,258. Then in your leases have you a clause granting compensation for certain manures?—Yes, for all manures.

17,259. And for cake consumed?—For cake.

17,260. Can you tell me the per-centage you allow for manures at the end of a lease upon the outlay?—I am afraid I can hardly tell you exactly, but for lime, for instance, we give the whole for the first year and then it graduates the whole way down, and the same for bone and other manures.

State loans.

17,261. (*Mr. Clay.*) I think you said that as one of the remedies Government should advance money?—Yes.

17,262. For building, &c.?—Quite so.

17,263. At what per-centage?—I did not put down any amount; I simply said at a low rate of interest.

17,264. But the Commission would like to know your opinion upon what you call a low rate?—I think 3 per cent.

Position of tenants.

17,265. Do landlords in your county retain their tenants from generation to generation, as a rule?—As a rule the tenants go on as they do on my own estate; I think so; that is generally the case.

17,266. Have these tenants who have gone on from generation to generation been able to advance their families as they grow up?—What they have generally done is this: they have put their sons out on farms; I do not think that they have given them very much money, but they have given them stock and started them. I do not think that they have given them capital so much as they have furnished them with a certain quantity of cattle to stock their farms.

17,267. And, on the whole, these last two or three years they have been prosperous?—I will not say the last few years.

17,268. Well, then, until the last few years?—Yes, I think they have done fairly well, but they have been gradually losing capital; the difference in the price of wool has affected them as much as anything.

Prices of cattle.

17,269. (*Mr. Giffen.*) You told us that the fall in the value of store cattle in the last few years was about one half?—Yes.

17,270. I suppose the fall in the value of fat cattle has not been quite so great?—It has not been so large in proportion.

17,271. Could you tell us the reason why it is so large in the case of store cattle, and not so large in the case of fat cattle?—It may be accounted for in this way: we do not fat any cattle in the district as a rule. What we breed is store cattle, and we are very much dependent upon graziers coming down from the north and buying our store cattle. Our land is not good enough to feed them, and the store cattle is generally sold to dealers who buy them and take them to the north, and the different counties there where they are fattened.

17,272. So that the causes of the fall in the value of cattle generally tell with greater force upon your store cattle than they do upon cattle all round?—They do.

Investment in land and and other industries.

17,273. With regard to that sum of 150,000*l.* which you told us you had spent on your own property without getting any more rent, you made a remark that you thought you would have done better if you had put that 150,000*l.* into other securities?—I did.

17,274. But is that quite certain? Would not that depend upon the other securities very much?—It would depend upon whether they were sound or not.

17,275. I ask the question partly because a gentleman who gave us very good evidence some time ago, gave us a particular account of his losses in Agriculture, and I asked him privately shortly afterwards if he thought he would have done better if he had had his money in anything else, and he told me that what savings he had, some part of them he had put into shipping and on the whole shipping was worse than the agriculture?—That may be, but if I had put that 150,000*l.* in good securities——

17,276. That is just my point, that it is a question of the security?—I would put it into Consols, and if I had put it into Consols I should have been better off.

17,277. There are many trades and industries into which you might have put the money with no better result than the result that you have experienced?—That is true; but I do not think I would have put it

Right Hon. Sir M. Lopes, Bart.

19 Apr. 1894.

into any other security than a sound one, and that is the only reason why I say that if I had put that money into other securities instead of expending it on my estate I should have been better off.

17,278. (*Mr. Little.*) I think you said if you had put it into the funds?—Yes.

17,279. (*Mr. Long.*) Taking the general run of landowners to whom your evidence applies, it is not their practice is it to embark in extra enterprises like shipping or trade?—No.

17,280. (*Mr. Giffen.*) Still is there any other great trade and industry such as shipping that has not suffered almost about as much as agriculture has suffered?—I am not aware of any industry which has suffered so much and so long as agriculture.

17,281. The iron trade for instance. Has there not been a great deal of suffering there?—That is only recently; during the coal strike.

17,282. Is that quite so?—You are a better judge than I am.

17,283. Is not the iron trade the trade in which there are tremendous fluctuations from time to time, and very great suffering is experienced in it?—I am afraid I do not know enough of the iron industry to give an opinion upon it. No doubt other industries have suffered, but I contend that no industry has suffered so much as agriculture.

17,284. I am not arguing the question with a view of disputing that there has been more depression in agriculture, but simply to call your attention to the fact that there is depression in other trades?—I admit that.

17,285. (*Mr. Long.*) The question I want to ask you is whether Mr. Giffen's question does not supply its own answer, namely, that the fluctuations in the iron trade are as between great profits in very prosperous times and great losses at other times, whereas in agriculture the profits have never been great, whereas the losses have been enormous?—That is so.

17,286. (*Mr. Giffen.*) Is that so?—I think so.

17,287. (*Mr. Long.*) Can you give one single owner of land throughout Great Britain who has in the past in prosperous times made a fortune out of the ownership of his land?—I think not; I do not know of any; it is only a question of time when all our large houses and mansions will be deserted.

17,288. (*Mr. Giffen.*) Then you say your income is not more than it was 40 or 50 years ago?—My rental is not greater; my agricultural rental.

Rental and purchasing power of money.

17,289. Do you think that owing to the general fall of prices the rental that you receive has greater purchasing power; owing to the general fall of prices the rental which you get goes further in purchasing than it did 40 or 50 years ago?—Do you mean that the value of that money is greater?

17,290. Yes?—I do not think it is; it may in some cases be greater in buying food, but as a general rule I do not think it is. I think that we have all become a little more luxurious than we were, and certainly our wants are greater.

Cost of building.

17,291. Although that money, technically speaking, might go further, and buy more things, yet owing to the advance in the scale of living it does not really go further?—I do not think that it does.

17,292. Then with regard to the increase of 30 per cent. in the cost of building as compared with 30 or 40 years ago, you said not only labour but everything had increased?—Yes.

17,293. And then you added, I think, that the requirements of the cottage were more than they had been; I should like to ask you whether the price of materials generally for cottages has gone up?—Certainly, the price of slate has increased.

17,294. As compared with 30 or 40 years ago?—Certainly; I should say 30 per cent. increase in the price of slate alone since I recollect it, and there is also an increase in the price of timber.

17,295. As compared with 30 or 40 years ago?—Certainly, of course the material, the stone, very much depends upon the locality, whether it is near or not. We have no brick; the cottages are all built with stone, and, of course, the difficulty there is the access to the material.

Right Hon. Sir M. Lopes, Bart.

19 Apr. 1894.

17,296. Is that quite certain about timber?—Yes; I can only speak from my own knowledge with regard to timber, and certainly timber is dearer than it was 30 years ago.

17,297. Has not there been a great fall in timber in 30 years?—I am not aware of it; we have not had the benefit of it.

17,298. So that the effect of your evidence is, that notwithstanding the fall in prices of agricultural produce, and the fall in rents, the prices of certain things which you have to buy, such as slates and timber have rather increased?—I may also add the cost of labour.

State loans.

17,299. With regard to those State loans at low interest for the special purpose of building, can you tell us the special reasons why the State should lend money for that purpose that you desire?—Well, I think the depression of the agricultural industry is a reason.

17,300. But the State cannot be a universal moneylender?—No.

17,301. Why should it lend to the agricultural interest more than to any other interest?—Because it is the most important industry of the country, and the State ought to be more interested in it than in any other; it has been the foundation of our national property.

Rates.

17,302. That is the only special reason you give?—Yes.

17,303. And no political or economic reason of another kind?—No.

17,304. With regard to the transfer of the Poor Rate, and Lunacy Charges, and Police, to the Imperial Exchequer, would not the general effect of all such transfers be to benefit the owner rather than the farmer of land?—I do not think it would benefit the owner half as much as it would the yeoman; the man who is the owner, and occupier of his property.

17,305. Still it benefits the man in his capacity as owner and not as farmer?—Well it would benefit both: I do not think that the owner is going to get the whole benefit of it.

17,306. But the tendency would be for rents to go up as rates were diminished?—I do not think there is any tendency of rents going up. The tendency is to lower them.

17,307. But still the rents would be higher than they otherwise would be if the rates were taken off the land?—I do not think that the difference in the rate is going to make any difference. I think I told you that I would divide rates between owners and occupiers.

17,308. And you do not admit, as a general rule, that rents tend to fall as rates go up, and to increase as rates go down, other things being equal?—I do not think that it makes any great difference.

17,309. You do not admit that?—No, I do not.

The marketing of foreign meat.

17,310. You did not explain, I think, in what way the labelling of foreign meat would benefit agriculture; you said it would be equitable and the right thing to do, but you did not explain in what way it would benefit the farming interest?—It would give rather a spur, and an advantage to home produce.

17,311. Is that quite certain?—I think it would. I think that everybody would prefer home grown meat to foreign, but I think there is a great deal of foreign meat which is passed off as home grown meat at present.

17,312. Did you go into the evidence before the House of Lords Committee, which was rather to a contrary effect; some of it at least?—I did not see it.

17,313. The evidence was that it might benefit the foreign producer, and not the home producer?—I did not see that evidence.

Income tax.

17,314. With regard to the assessment to the income tax upon the farmer under Schedule B., you said, I think, that the assessment should be upon a third and not upon a half?—I think the same principle carried out in Ireland and Scotland should be applicable to England.

Right Hon. Sir M. Lopes, Bart.

19 Apr. 1894.

17,315. But is it a good principle?—I think it is.

17,316. Is there any reason to believe that the income of the tenant is one-third or a half of the rent?—I think there are very few tenants who keep farming accounts. It is very difficult to ascertain that, but very few men make a profit equivalent to half their rent.

17,317. Would you say that a man who pays 200*l.* a year does not make 100*l.* a year out of the farm as a rule?—I think very few of them have done so lately.

17,318. Do they live at the rate of 100*l.* a year?—I cannot say exactly that; they live in anything but a luxurious way, but as to 100*l.* a year I do not know.

17,319. Does a man who pays 100*l.* a year rent live at the rate of 50*l.* a year as a rule?—I do not know what that living comprises. What do you mean by the living.

17,320. I am assuming his income in the same sense as any other man's income, and if a man lives out of his income that would be his living?—I cannot say.

17,321. I want to ascertain whether the basis of these regulations of the income tax is a sound one or not?—I think that it would be only fair that a man should only pay his income tax upon one-third. At present it is one-half. I say that is very severe upon the man, and I do not see why the same rule should not be applicable as in Ireland and Scotland where he only pays on one-third.

17,322. If the rule is not a good one in Ireland and Scotland would you still apply it to England?—My opinion is that we ought to be on equal terms.

17,323. You do not know the reason of half or of one-third? I cannot say that I know any particular reason I do not know any reason why in Ireland the rating and the assessments are the same now as they were about 50 or 60 years ago, and have never been raised.

17,324. Is it not quite possible that the whole basis of it is erroneous, and that the income on the average ought to have been reckoned very much higher under Schedule B.?—I think not.

Large and small farms compared.

17,325. (*Mr. Whitehead.*) You said that in your district there are a few tenants farming about 50 acres and working the farms themselves. Could you say whether they have done better than other tenants who held large farms?—I think they have, but that is only the case where a man has had a family and has not to employ extra labour.

17,326. Has their cultivation been different from larger farmers?—It is very much the same. The farmers all rear cattle and that is the staple commodity.

17,327. And they are dependent upon milk?—They keep a very small dairy.

Fruit growing.

17,328. You said that you thought that the fruit industry would be overdone. Does that apply to places like Somersetshire and Devonshire?—We have very little fruit growing in Devonshire; there is more in Cornwall where they have a better climate; but I am told that last year a great deal was spoilt, and they were not able to sell it owing to the quantity.

17,329. Do they grow a great many apples in Somersetshire and Devonshire?—They used to. I do not think there is anything like the number of orchards that there were. Cider is not made in such large quantities.

17,330. But according to the agricultural returns the acreage in Somersetshire and Devonshire has not decreased?—All I can say is, I have never made an orchard, and I have destroyed a great many.

17,331. Because it is unprofitable?—Because it did not pay.

17,332. But still, in spite of that, the acreage is increasing in Somersetshire and Devonshire?—I am not aware of it in Devonshire, at any rate.

Right Hon. Sir M. Lopes, Bart.

19 Apr. 1894.

17,333. I think that is so?—I am not aware of it.

The letting of farms.

17,334. (*Sir Nigel Kingscote.*) You said that there was a certain demand for farms when they came in hand—a small demand. Does that demand entirely arise from the farming interest?—I think generally it does.

17,335. No fresh blood comes in, if I may use the expression?—None.

17,336. The sons and relations of those who have been farming themselves continue to take the farms?—Yes, our difficulty is that farmers' sons who live out towards the moor do not care for it, and they leave their parents and go into the towns, so that the difficulty of the farmer is becoming greater. He does not get the assistance of his family as he used to.

17,337. Even the farmers' families want to get away?—They prefer going into the town.

17,338. Still, you are able to let your farms?—Yes, but we have not the same competition as we used to have.

Prices of cattle.

17,339. (*Chairman.*) Have you any table showing the comparative prices of lean stock for a succession of years?—I am afraid I have none.

17,340. Can you supply it?—I can try to get it.

17,341. It would throw light upon the subject as to when prices of store cattle began to fall?—Say, for the last four or five years.

17,342. You might go further than that, so that we may see when the changes occurred?—I will do that.

Reduction of rent.

17,343. Have the reductions of rent in your neighbourhood been about the same as your own?—I think they have.

17,344. Say, about 15 per cent.?—In some parts perhaps a little more towards Cornwall.

17,345. Then inasmuch as the tenants and their families have been on the farms so many years shows that the farms have been low rented?—Yes, we have not let by tender and rents have seldom been altered.

17,346. Therefore the reductions on other estates in the neighbourhood which may be high rented would be rather more?—I think they have been rather more.

17,347. What would you put it at?—From 20 to 25 per cent.

Cost of building.

17,348. (*Mr. Elton.*) You said about the price of the building materials making it difficult to build. Did you say that you used brick?—We use no brick in our neighbourhood. We are obliged to get stone, and that stone is not good stone; it is affected by moisture; it is a bastard sort of granite, and we have to cement it outside.

17,349. There is a natural supply, but it is an inferior stone you say?—It is an inferior stone.

The planting of timber.

17,350. (*Chairman.*) Would it be worth while to extend the planting of timber in your district?—Two years ago we had a blizzard which almost destroyed every bit of timber we had.

17,351. Was it not confined to the district?—Yes, to the district round me.

17,352. Did it destroy everything?—It destroyed everything almost with me, whole avenues were destroyed; every tree almost that I had. Trees planted from 40 to 50 years ago; hundreds of acres of them were rooted up.

17,353. That is a thing that might occur once in a century?—It might. You asked me whether I thought it would pay to plant.

17,354. Yes?—I do not think it does upon poor exposed land. That is my experience.

The witness withdrew.

Mr. S. Rowlandson. 19 Apr. 1894.

Mr. SAMUEL ROWLANDSON called and examined.

17,355. (*Chairman.*) You are a farmer living at Newton Morell, near Darlington?—Yes.

17,356. You gave evidence before the Duke of Richmond's Commission in 1881?—I did.

17,357. Do you hold the same farm that you did then?—I hold the same farm that I did then and reside at the same place, and I also hold in addition to that a farm of about 1,600 acres on the side of the Tees opposite Middlesborough.

17,358. You have increased your holding largely since then, have you not?—Yes.

Existence of depression.

17,359. What has been your experience in the interval since 1881?—With the exception of one or two years the depression in agriculture has existed during the whole period.

Reduction of rent.

17,360. What has been your experience in respect of your own holding?—My own experience has been with regard to my own holding that I have been obliged to request a reduction of rent since that time, and I am also applying for a reduction of rent at the present moment.

17,361. Did you get a reduction of rent?—I got a reduction of rent in 1881, and also in 1886, and in 1887 I got a further reduction.

17,362. What was the per-centage of reduction in 1881?—If I remember the right figures (I am speaking entirely offhand), it was reduced from 1,325*l.* to 1,000*l.*, and since then it has been reduced to 800*l.*

17,363. That is in respect of the farm of 1,000 acres which you then held?—It is about 800 acres altogether on that farm.

17,364. You stated in the evidence that you rented a thousand acres; that is not quite accurate, is it?—It is a little over 900 acres at that place, but over 1,000 acres in all in 1881.

17,365. And the rent at one time was 1,325*l.*?—Yes, and that included some drainage, and it was reduced in 1881 to 1,000*l.*, and since then to 800*l.*, less the tithe and other matters.

17,366. And as to the other farm taken in hand; what do you say about that?—That farm that I took in 1881, I thought that there was a prospect of things improving, which made me take this farm; I took it at a considerably reduced rent to what it had been.

17,367. What had been the rent?—It was a grazing farm. At one time, a great many years ago, it was held at 2,100*l.*; and then it was let at 1,800*l.*; and then it was let at 1,500*l.*; and previous to my taking it it was 1,150*l.*; and I took it at 900*l.*, subject to payment for surface damages by the salt companies, who are pumping salt upon the place.

17,368. Going back to the original farm the rent is now reduced to 800*l.* for the 800 acres?—Practically that portion is 800 acres, but I have some in addition to that.

17,369. (*Mr. Chaplin.*) You have asked for a further reduction of that?—Yes.

17,370. May we ask how much?—That is a matter of arrangement between the agent of the estate and myself, but he is going to meet me on the 26th.

17,371. (*Chairman.*) What is the nature of that farm?—A strong loam.

17,372. What is the cultivation of it?—It is now half grass and half arable; I have laid a certain portion of it away to grass; the worst of it.

Rates.

17,373. Have you had a reduction of your assessments for rating in proportion to the reduction of rent?—Yes.

17,374. Have the rates in the pound been about the same, on what are they?—The poor rates are about the same; we have had a slight increase in some other directions.

17,375. Taking them all round, what is the difference in the pound?—Do you mean between now and 1881?

17,376. Between now and 10 or 15 years ago?—It is very much the same. I do not think there has been any very great increase.

17,377. The actual amount is considerably less in consequence of the reduced rent?—I pay less than I used to.

17,378. And the tithe has been reduced too?—The tithe I have nothing to do with; the owner pays the tithe.

Tithe.

17,379. Before that it had been reduced?—Before that I paid the tithe. Of course the tithe has gone down very considerably.

17,380. Did the owner, when he took over the payment of the tithe, make any addition to the rent?—That was taken into account when the rent was arranged.

17,381. Then, in fact, there has been some further reduction of rent because he has paid the tithe?—Yes.

17,382. What did the tithe amount to?—To something like 80*l.* a year for tithe and land tax.

Wages.

17,383. Well, then, as regards labour; what are the wages?—I quoted my labour bills before the Duke of Richmond's Commission right through from 1854. The wages at the present time with us, I may state, are 17*s.* per week for ordinary men, their houses free and coals led. For the better class men they run to about 18*s.*

17,384. (*Mr. Everett.*) Is the harvest work included in that?—The harvest work is included in that. The female and the datal labourer gets extra for harvest.

17,385. What is datal labour?—It may be a provincialism, but it means men engaged for the week, and those men get harvest wages. The other men are engaged for the twelve months, and the datal labourer is a free man.

17,386. The ordinary men have to do the harvest work without extra pay?—Yes, except in case of very late hours, and then they make a condition.

17,387. (*Chairman.*) How do these wages compare with what they were 10 or 15 years ago?—They are higher than the average. From 1872 to 1876 we paid up to 22*s.* per week.

17,388. Then they went down after that?—Yes, after that they got as low as I think about 16*s.*, now they are back again, and are above what they were.

17,389. Do you employ fewer labourers in consequence?—No, I employ quite the same.

17,390. Laying down in grass has not affected the total number, has it?—It has not. Of course I have tried to do the other land better if I could, in order to keep the same amount of stock.

Result of farming.

17,391. Then taking your own experience during those years, have you made a profit in those years or not?—I have had a very hard set indeed to make a balance, and occasionally I have had a considerable loss.

17,392. Have you had a profit in any of those years?—Yes, I had one in 1884.

17,393. Not since then?—No, I do not think I have made a profit worth naming since then. For several years I have had a very considerable loss.

Income tax.

17,394. Have you applied for a return of Income Tax?—Upon two different occasions I did, but the trouble of fighting the question was so great that I gave it up.

17,395. What did the trouble consist of?—In the innumerable queries to answer in reply to the Surveyor of Taxes, before you could convince him that you were entitled to it.

17,396. Had you to go direct to Somerset House, or was it to the local Income Tax Commissioners?—To the latter.

17,397. You were treated in the same way as any trader would be?—I think so.

17,398. You were compelled to produce your balance-sheet and answer any questions?—I did produce my balance sheet, and I had innumerable questions to reply to both by letter and verbally, and I got tired of it.

17,399. And you have paid your Income Tax upon half the rent?—Upon half the rent, which I consider is more than I received.

17,400. (*Mr. Little.*) Is that since the new regulations came in?—That was previous to the new regulations.

17,401. (*Chairman.*) Possibly under the new regulations the process may be simplified?—It may, but I know the difficulties of the Income Tax; I happen to be an Income Tax Commissioner myself.

Mr. S. Rowlandson.

19 Apr. 1894.

17,402. Now what has been the effect of the depression generally in your district?—Do you mean upon the owners?

Effect of depression (*a.*) Upon owners.

17,403. Yes?—Upon the owners the reduction of rent is, as near as I can speak, about 20 to 30 per cent.

17,404. And in your own case they appear to have been larger?—Yes, because there was a considerable amount of that rent of 1,325*l.* which was interest upon drainage that was just expiring about that date.

17,405. Generally in your neighbourhood the reductions have been from 20 to 30 per cent.?—From 20 to 30 per cent. There are instances where it has been more, but I think that would be the general run.

17,406. And accompanied by increased expenditure on repairs and buildings, by the landlord?—In some cases, where that has been done to any great extent, the reduction has been perhaps rather less; it has been met partly in that way.

(*b.*) Upon small owners.

17,407. What has been the effect upon small owners?—Very similar indeed.

17,408. Are there many small owners in your district?—There are some.

17,409. Men who farm their own land?—There are some, but not so many as there used to be many years ago.

17,410. Have the absolute owners of property received a less percentage on their investment?—Yes.

(*c.*) Upon limited owners.

17,411. And how has it been borne by the limited owners?—I suppose by limited owners, you refer to those who are partly owners with the other branches of the family as well.

17,412. Yes?—In many cases it has been of very great hardship indeed on those owners.

(*d.*) Upon farmers.

17,413. Then as regards the farmers, what do you say?—I think the farmers have all suffered very considerably.

17,414. But those who farm their lands highly, have they suffered?—I think they have suffered more than those who have not, because in many cases, they have not got that proportion of reduction of rent which some of those who farm badly have received.

Large and small farms compared.

17,415. Have the smaller farmers done better than the larger ones?—In the case of some of the smaller farmers who worked their own farms, and work on the land, instead of having labourers, they do not apparently suffer as much as others; but if you look into the question, you will find that the sons have not received wages, but simply a small allowance of pocket money and clothes, and I do not consider that many of those men are in as good a position as what I may call annual men.

Condition of labourers.

17,416. I suppose the labourers have gained?—I think the position of the labourer is decidedly better than it was 30 or 40 years ago. As a rule they have better cottages, they have better clothes, and they have more accommodation, and everything is better for them.

17,417. And the low price of food has benefited them?—Yes.

Land out of cultivation.

17,418. Has any land gone out of cultivation?—I am not aware of a single farm having gone out of cultivation.

Changes of tenancy.

17,419. Have there been many changes of tenancy?—Very few just lately. After 1879 there were a great many, but within the last two or three years there have not been so many.

The letting of farms.

17,420. Have the landlords found any difficulty in getting tenants?—None; in the last year or two farms have been better to let than they were; I think that the increased application for farms during the last two years is more due to the better seasons we have had than anything else. I think we were very much favoured last year in the north as compared with the south, and that that has put a certain amount of heart into the farmers which they had not previously.

Tenants' capital.

17,421. Are there men of capital ready to go forward to farm or not?—They are a very similar class of men to what we have had in many years past, but their capital is considerably reduced.

17,422. And a given amount of capital goes further than it did on account of the low prices you would say?—I do not think that it does. Grazing cattle are quite as dear in proportion to the price of beef. I think they are dearer than they were in proportion to the price of beef.

Mr. S. Rowlandson.

19 Apr. 1894.

17,423. Has much land been laid down into grass in your district?—A certain amount; I have laid down about 200 acres on that farm, and 100 acres on the other farm since I took it in 1891.

Land laid down to grass.

Spending powers.

17,424. Should you say there is generally a decreased spending power on the part of the agricultural class of farmers?—There certainly is amongst the farmers; I do not think there is amongst the agricultural labourers.

17,425. What do you say with regard to the owners?—Amongst the owners, certainly.

Foreign competition.

17,426. What do you consider the depression due to in your district?—I consider it is due very greatly to the great foreign competition that we have to contend with.

17,427. Has it been partly due to the depression of trade?—To a certain extent it has; I may say to a considerable extent.

The coal strike.

17,428. And the coal strike has had an effect upon it I suppose?—The coal strike in the Midlands affected us very considerably indeed, especially with regard to the sale of meat, because a very large proportion of our best cattle goes to Wakefield Market, and that market last year, and even since then, has been very considerably affected by that strike.

The slaughter of foreign cattle.

17,429. Have you any opinion upon the subject of the importation of live stock?—I certainly think it would be advisable in the interests of the country at large that the fat stock should be slaughtered at the port of debarkation in order to keep out disease.

17,430. Do you recommend that in the interests of the health of the stock?—Yes.

17,431. Not for the purpose of raising prices?—Certainly not, not in any way in the form of protection.

17,432. Then you are not in favour of putting any limitation upon the importation for the purpose of preventing competition?—No, I think we shall have to contend against that. It is such a serious thing if we are getting disease. In a large head of cattle it is utterly impossible to work the stock if there is any fear of disease in the immediate neighbourhood and it is a most serious thing if a case does occur. I may state this that upon my farm in the neighbourhood of Middlesborough, the year before last, an animal was inspected there by the inspector for Middlesborough and was reported to the Board of Agriculture as being a case of pleuro-pneumonia. Fortunately it turned out not to be pleuro-pneumonia but it was slaughtered. At that time I had 270 head of cattle upon that farm and if that had been a case of pleuro-pneumonia, I presume that the whole of the cattle would have been slaughtered, and I should have been in this position in March or April, I forget exactly, I should have had to go to market to purchase my stock at probably an advance in price of 2*l.* a head at that time, and would have been unable to purchase the same class of cattle.

Bad trade generally.

17,433. You state in your notes that the diminished demand for agricultural produce has been principally owing to bad trade in the large centres of population and the labour disputes throughout the country?—I think that is very considerably assisted by the poor demand at the present time.

Bad seasons.

17,434. And you also say that the unfavourable seasons have had a great effect?—Yes, that is so.

17,435. But in that respect there was a change in the last two years?—During the last year certainly. You have been able to work the land more satisfactorily and cleaner than during those wet seasons and I think it has put a certain amount of heart into the farmers, that the expenses have been less, and that they have a prospect of getting better crops than during those very adverse seasons.

Deterioration in farming.

17,436. Should you say that in your district there has been a deterioration of farming?—There is no question about it. That is partly due to the seasons, but it is also partly due to diminished capital.

The Agricultural Holdings Act.

17,437. You gave a good deal of evidence in 1881 upon the subject of the Agricultural Holdings Act?—Yes, I did.

17,438. What is your opinion of the working of the Act of 1883?—I think the Act of 1883 has had a beneficial effect in this way, that it has induced many landowners to insert in their agreements clauses giving compensation, whereas previous to that we practically had no compensation whatever on quitting.

Mr. S. Rowlandson.

19 Apr. 1894.

17,439. You think it requires amendment?—I do.

17,440. In what respect?—I think there ought, now, considering the very bad price that wheat is selling at —26*s.* or 27*s.* per quarter, to be an allowance for the consumption of corn grown on the premises, the tenant proving that the corn has been consumed.

Compensation for home grown produce.

17,441. Would there be a difficulty in giving satisfactory proof of that?—I think there would be difficulty, but still at the same time it is a difficulty that might be contended against.

Compensation for continuous high farming.

17,442. What further amendments would you suggest? —I think for the benefit of the community at large there should be an allowance for continuous good farming. At the present time we often have claims for the deterioration of the land and if the tenant has improved the state of the farm in its cultivation I think he ought to be paid for that if he is to pay for deterioration.

17,443. How would that be assessed?—I think that might be arrived at in this way: that if there were an inspection of all farms on quitting and an inventory were made as to the state of hedges, fences, ditches, gates, buildings, &c. that then there would be a basis to go upon and you might very fairly arrive at the improvement that had taken place in that farm during the occupancy of the tenant.

17,444. Would it be an expensive thing to make an inventory of this kind in detail of every holding?—I do not think it would. I think that an inventory could well be made by the agent and entering tenant or it might be made by appointment of one arbitrator between them, or if each appointed an arbitrator and they required an umpire that that umpire should be appointed from a list chosen by the County Council.

17,445. That would necessitate the calling in of two arbitrators and I suppose an umpire in order to make this inventory to record the condition of the farm as between the incoming tenant and the landlord at that time?—Yes, I think that might be done.

17,446. That might result in an expensive process? —I think that might be easily done for 10 guineas for a farm of 400 acres.

17,447. Would you get two arbitrators and an umpire to do it for that?—I think that might be done, it ought to be done in a day.

17,448. Then at the end of the tenancy the new inventory would be compared with the old one?—Yes.

Free cultivation.

17,449. Then what further changes would you recommend?—There are many restrictions on antiquated agreements which certainly might be relaxed, and a tenant should be allowed to crop his farm as he likes upon the condition that he is liable for deterioration and for keeping up the state of the farm.

The schedules.

17,450. Well then, as regards the schedules, what do you say?—I think there might be alterations with advantage in the schedules.

17,451. In what respect?—Where the consent of the landlord is required, for instance some of those might be limited in extent probably.

17,452. Do you mean by that that the landlord's consent should be dispensed with in some of them?— Yes.

17,453. Which of them?—I have not the Act with me at the present moment. I think I may state with regard to that that there will be a schedule of those handed in most probably by a Committee of the Central Chamber of Agriculture which is now sitting.

Claims and counter-claims.

17,454–5. Well then as regards the claims by landlords for the dilapidations, what do you say?—I think that the landlord ought to have a claim for dilapidations precisely in the same way as the tenant has a claim for improvements, and I think it should not be necessary that the tenant should send in a claim but that the landlord should have his claim in spite of that; that both notices should be given on the same day.

17,456. Is there anything else?—No, I think not.

17,457. You say that the landlord's and tenant's claims should be sent in on the same day, and as near the expiration of the tenancy as possible, but the landlord should be allowed till 14 days after the expiration of the tenancy for a further claim for any damage done by the removal of fixtures?—Yes.

Umpires.

17,458. Then as to the umpires, what do you say?—I think it would be a very good plan indeed, if a certain list were prepared by each County Council of men that are capable of acting as umpires in those cases, and that list would be submitted to the Board of Agriculture, and if an application were made to the Board of Agriculture for the assistance of an umpire, that umpire should be appointed from that list, either from that county or some neighbouring county, so that it may be taken from a list approved by the County Council, and being appointed from the neighbourhood he would have some knowledge of the land, and the state of agriculture there.

Mr. S. Rowlandson.

19 Apr. 1894.

Land courts.

17,459. Is there any demand in your district for the determination of rents by an independent tribunal?— No.

17,460. Has the matter been discussed by the farmers of your district?—It has.

17,461. And they are not favourable to it I believe? —No, they are not.

17,462. Can you state the reasons why they are unfavourable?—Is that with regard to the Land Court?

17,463. Yes?—I think the general opinion of the tenants is that a question of rent is a question between the owner and occupier.

17,464. And they do not wish or desire that the matter should be referred to a tribunal?—No. I think that as far as I know, the relations between the owner and occupier in our neighbourhood are friendly relations.

17,465. What are the tenancies; are they generally from year to year?—Upon the whole they are from year to year.

17,466. Were there leases at one time?—No, very few.

State loans.

17,467. What further changes in the law do you recommend?—I think it would be a very great advantage indeed, especially to the owners of property, and also an advantage to the tenants if loans could be made to the owners of property to erect buildings, and make other improvements upon the property which, in many cases, they are unable to do at the present time.

17,468. Is there much to be done in that respect in your district?—In many cases, especially in the covering in of yards.

Drainage.

17,469. As to drainage; is there much room for further drainage?—Yes; for instance there was a very great quantity of land in our district from 1856 to 1864 drained.

17,470. But not lately?—There has been some done lately, but nothing like the number of acres done in those days. There are certain lands that want re-draining, there is no doubt about that. I think one of the greatest improvements that we could have at the present time would be the covering of yards.

17,471. Is any drainage done by the tenants in your district?—I have done a very great deal myself.

17,472. Is it done generally?—I do not know that very much has been done. I have done it on an arrangement with my landlord on the 24 years principle, I finding everything.

17,473. In your own case that is an arrangement with your landlord?—Yes.

17,474. Under the Agricultural Holdings Act?—No, independently.

Light railways.

17,475. Then with regard to marketing the farm produce, do you think improvement may be effected by extending light railways?—I think in some districts that might be an improvement.

17,476. Do you think that the burdens upon the land should be reduced?—Yes, I do.

17,477. In what way?—In every way that they possibly could be at the present time. I think it would benefit the general community. Of course if you could in any way improve the prosperity of the agricultural class I think that that gradually circulates amongst the whole population.

Technical instruction.

17,478. Can anything be done in the way of improving the education of the farmers?—Yes, especially with regard to the manufacture of cheese and butter.

17,479. Does the production of butter and cheese increase in your district?—The production of cheese is increasing. I may state that our County Council has taken very considerable pains in the matter especially as to the Wensleydale cheese. They have given an

Mr. S. Rowland-son.
19 Apr. 1894.

annual grant of 150*l.* a year towards that object, and I must say that the manufacture of that cheese especially, which is a very good cheese, is considerably improved by that grant having been given.

Co-operation.

17,480. Can anything be done in the way of co-operation with the farmers?—I think a considerable amount might be saved by co-operation in the purchase of manures and feeding stuffs, and I may state that I originated a little association amongst farmers in our immediate district about 18 years ago. We began with eight members and now we have between 40 and 50 in that society for the purchase of manure alone, and we have saved a considerable amount of money by it and not only that, but every particle of the manure is paid for subject to analysis.

17,481. So that you have much greater security of getting a genuine article?—Much greater security in getting a genuine article, and not only that, but it is also a security for the owner or incoming tenant of farms if they have to pay the outgoing tenant for his expenditure in manures. It is a guarantee at once that those things are genuine. I may state this with regard to the Parish Councils Bill; I must say that I do think the rate upon land ought to have been put at one-fourth, under the same special clause as the Sanitary Act of 1875 and not upon the whole rateable value of the land, as I consider that the bulk of the money will be spent in the villages and none of it spent on the solitary farm-houses which have to pay, and which are in some instances a long distance from the villages for the benefit received in the villages and not by them at all.

The Parish Councils Bill rate.

Small holdings.

17,482. Is there any demand in your district for small holdings?—None whatever. All the labourers have good gardens and they do not ask for any more at all.

Technical instruction.

17,483. (*Viscount Cobham.*) In what form is agricultural education given by the County Council in your district?—There have been lectures in different centres.

17,484. Is it on farming generally?—Yes, on the application of feeding stuffs and manure, and lectures have been delivered on dairy management and butter management, and also veterinary lectures.

17,485. Have they been well attended?—In many cases very well indeed.

17,486. And they have given satisfaction?—Yes, general satisfaction in every way—they are supplied by the Yorkshire College.

17,487. Have these lectures been attended by practical farmers?—I am speaking more particularly of the lectures given at a village about three miles from my place, and many of which I have attended, as I happen to be on the County Council for that district and I went specially to see how they were attended and I found very many sons of farmers or young men who have just started farming.

17,488. And you have not found that they have run down those lectures?—No, I have not. At the veterinary lectures I think they average a little over 60.

17,489. Is anything done for the instruction of the labourer in the principles of agriculture?—In that same village application has already been made—at any rate it will be made in a week or two—for lectures on cottage gardening.

Labour.

17,490. Have you much to complain of as to the general efficiency of the labourer now as compared with 30 years ago?—They are not required to do the same amount of work. The north country labourers I must say are fairly good men; the only difficulty that we have now is to get men to cut hedges, clip sheep, or to thatch. We have a little difficulty there, but we have the greatest difficulty in getting good hands at cutting hedges and I have made a suggestion to the County Council which has been carried and will be laid before the Technical Instruction Committee, and I carry with me the entire feeling of the Council—to give prizes for labourers for hedge cutting, stone walling, and clipping sheep and thatching, but the only way that they could give prizes is that it must be the result of instruction and the difficulty is in carrying that instruction out.

17,491. (*Mr. Little.*) You must give some instruction?—Yes; since then I assisted in originating prizes for hedge cutting, and I must say they have been exceedingly successful during the last few years, there were 38 competitors last year, and 32 this year.

17,492. Has the County Council succeeded in giving the labourers a more intelligent interest in their work and so keeping them in the country?—I think it will do a great amount of good, if we can do so, but the difficulty is in giving those prizes as the result of instruction.

Mr. S. Rowland-son.
19 Apr. 189

17,493. You are in favour of granting State loans for the purpose of agricultural improvement?—Yes.

State loans.

17,494. Do you mean loans at a low rate of interest?—Yes, 6¼ per cent. is too much.

17,495. At what rate of interest?—You might have a longer period and the State ought to grant it on as low terms as they possibly can. It would not be for the benefit of the owner and occupier of the farms alone, but for the benefit of the community at large.

17,496. You would not put the duration of the improvement in the case of drainage at a longer period than 25 years?—I am not very sure, I think you might fairly put it at a little more.

17,497. Did not I understand you to say that a good deal of the draining between 1850 and 1864, has now to be redone?—That is nearly 30 years ago or more.

17,498. You think the period could be lengthened?—I think it might be lengthened.

17,499. In the case of building the period would be longer still?—It might be 28 years for that.

17,500. How would you secure those loans?—By a charge upon the property.

17,501. Taking precedence of all mortgages and family charges?—That is a difficult point at the present time, I admit.

17,502. Of course they would have to come after the existing mortgages?—After the existing mortgages.

17,503. You see some difficulty in putting a further burden in front of the mortgages and family charges do you not?—I think there are many farms on which money might be expended if the money could be got at a low rate of interest, and for which the farmers would be willing to pay a certain percentage in having the improvements effected especially with regard to the covering of yards.

17,504. If prices do not fall any more?—If the prices do not fall any more.

Reduction of rent.

17,505. (*Sir Nigel Kingscote.*) You told us that you had recently asked for a greater reduction of rent than you had previously obtained, and you also said that last season was a very good season. I suppose you asked for a reduction of rent on account of the reduction of prices?—That is so.

17,506. It has nothing to do with the seasons?—It is more particularly the very low price of beef.

Slaughter foreign cattle.

17,507. I do not quite understand whether you said you were in favour of all animals that come from abroad being slaughtered at the port, or that they were only fat cattle that you wanted to be slaughtered?—The whole of the animals, I think there is very great danger if you admit even Canadian cattle, for you cannot be certain that these cattle are not carried over the borders from America.

17,508. (*Viscount Cobham.*) Are you a breeder?—Not to a very large extent, I am a feeder.

17,509. (*Sir Nigel Kingscote.*) You buy and sell out?—I buy and sell out.

17,510. (*Viscount Cobham.*) You are not afraid of losing the supply from abroad?—We must contend with that. I think it is much better to pay a little more for our own stock and then we know the difficulties we have to contend with.

17,511. (*Sir Nigel Kingscote.*) Do you sell cattle in your neighbourhood by auction?—Hardly any myself, there are auction marts.

17,512. By private contract?—I sell all mine by private contract.

Sale by live weight.

17,513. Do you think there is any advantage in having the weighing machines?—I use the weighing machine and I have one upon each of my farms.

17,514. And you think generally it is a good thing?—There is no doubt that it is a great guide to judgment, but even in spite of the weighing machine the eye must be the principal guide.

17,515. Of course the eye must be used for quality too?—Certainly for quality entirely.

Wages.

17,516. You gave us the amount paid for labourers as 17*s.* per week, it sounds very high to us who live in

the south, and you also said that you were near salt companies?—My farm near Middlesborough has 26 pumping stations upon it.

17,517. Does that enhance the price of labour because there is other demand for labour?—There is no doubt that it enhances the price of labour but the general run of labour throughout our district is about 17*s.* per week.

17,518. And that covers a large district?—Yes; if you go into the county of Durham it is considerably more. I happened to be on some farms where they told me they were paying 19*s.* a week with a house and coals led. For shepherds and foremen we are paying 1*l.* to 23*s.* a week—I have several men at 1*l.* a week myself.

17,519. You cannot say roughly what your labour bill per acre comes to in the course of the year?—Upon the farm that I am on at home it averages 22*s.* to 23*s.* per acre. Upon the other farm near Middlesborough it is considerably less. It is all grass except 80 acres.

17,520. (*Mr. Little.*) Do you say a portion of the home farm is grass?—It is half and half.

17,521. (*Sir Nigel Kingscote.*) It sounds as if your own labour bill was very great?—That is what I think. Our north country labour bill is very great.

Price of cattle.

17,522. (*Mr. Whitehead.*) The lean stock is very good I suppose?—Yes, as near as I can tell, the grazing cattle that we require—and I bought between 300 and 400—run to about 1*l.* per head dearer than last year.

17,523. Why are they dearer in your district because you did not feel the effect of the drought?—We did not feel the effect of the drought so much last year, and we probably got hold of a better class of cattle than I think in any other part of the kingdom. I am speaking of Northumberland and Westmoreland and the southern division of the county of Durham and North Yorkshire, and we have to pay a little more for quality.

The Agricultural Holdings Act.

17,524. (*Mr. Clay.*) With regard to the Agricultural Holdings Act, how has it worked in Yorkshire?—I may say that I have had a great deal to do with the Agricultural Holdings Act, as I happened to be a valuer and I have given a great many awards under it. In several cases it has been a very great benefit indeed to good tenants, but I may also say that the owner not having the privilege of claiming upon a bad tenant for deterioration unless the outgoing tenant sends a claim in for his expenditure on cakes and manures, I think many a time the bad tenant has escaped where he ought to have paid, whereas if the landlord had had a right of sending in his claim without the tenant sending in his claim the bad tenant would have to pay considerably. I have known some instances of hardships upon the owner where the tenant ought to have paid.

17,525. Have you found that the procedure is cumbrous and the expenses excessive?—I quite see that, especially when you come in contact with the antiquated forms of agreement.

17,526. What remedy would you apply to save the expenses of the procedure?—I think that the suggestions which will come in from the Central Chamber of Agriculture will improve the Act; they will considerably simplify the Act I know, and I hope they will also cheapen the procedure.

17,527. So that it is your opinion that the regulations, which the Central Chamber are going to bring out, will improve the Act in the direction that we are talking about?—I do.

Payment of compensation.

17,528. And you see no difficulty in allowing the tenant to be paid compensation upon his corn?—As I said there is a difficulty about it, but I put it distinctly that the tenant must give full and sufficient proof that he has consumed that corn. It seems a ridiculous procedure that a tenant can cart his home grown corn to a market, and re-purchase precisely the same quantity, and be allowed upon one and not upon the other.

17,529. You would not allow any compensation for corn consumed by work horses on the farms?—I would not myself; I consider that the work horses upon a farm are part of the necessary appliances of the farm.

17,530. I think if I remember aright you lay great stress upon compensation being given for good farming, increased fertility, and the laying down of grass?—Yes, if it is properly done, of course.

17,531. But if it was not properly done there would be no compensation given?—There ought not to be.

17,532. But especially in the present time when arable land is paying badly, you lay great stress upon having the best land laid down in a good condition that will improve itself by good manuring?—Certainly.

17,533. Indeed old grass cannot be made without good cultivation and cake eating?—It is utterly impossible. You have mentioned cake eating. There is one point that under the present system of administering the Agricultural Holdings Act by the valuers—I do not say that you are bound down to the Act by what they do, but still the present system of administering the Act in our neighbourhood, and in Durham and Northumberland, is that the tenant is allowed one-third of his expenditure in cakes, during the last year of his tenancy and one-sixth on the previous year, but omits it in the previous years; but a tenant having been two years on a farm receives precisely the same payment as if his expenditure in cakes and manures had been going on for 30 or 40, or 50 years, and had been using a large amount of cake during the whole of the time of his occupancy of that farm, and I think he is certainly entitled to a considerable deal more than the tenant who has only been using cakes for two years. Any practical man can see at once, especially on grass land, where cake has been largely used, and the intrinsic value has been increased in that way by that large expenditure on cake.

17,534. (*Mr. Chaplin*). Is it not a fact that under the Agricultural Holdings Act there is no limit placed upon compensation to be given for cake?—I am quite sure of that, but under the administration of the Act that is limited. This is now growing, I am afraid, into a custom.

17,535. But then it entirely depends upon the valuer?—It does.

17,536. If the valuers carry it out strictly they have the power to deal with it in that way?—Yes, but if that were placed in the schedule with the intimation that it ought to be paid for that would be better.

17,537. (*Mr. Clay.*) In your large experience in the laying down of grass there is nothing pays the tenant or landlord better than to have it laid into old grass, and that can only be obtained in 20 or 25 years by a continual application of cake, especially by sheep. Is not that so?—I quite agree with you, and you cannot make that grass into really good grass under about 30 years.

17,538. And grass is like anything else, it can only be made by feeding?—By feeding, and continuous feeding.

17,539. I suppose you would say that cotton cakes and other cakes are the most beneficial?—My experience is that there is nothing improves a farm so much as the continuous use of cake.

Claims and counter-claims.

17,540. As regards claims you say justly that they should be made on the same day?—Certainly. I think that would prevent to a great extent large counter-claims which are made at the present time and I should like to see that word "counter" entirely eliminated. I think that the landlord is in many instances at as great a disadvantage as the tenant. The claims ought to be made on the same day so that one does not know what the other is claiming.

17,541. Do you say that the landlord is at a greater disadvantage than the tenant?—I would put him in a better position than he is at the present time and justly so, because I would do away with that part of the present Act which says that the landlord cannot claim under the Act unless the tenant sends in his claim.

17,542. The tenant must first set the Act in motion at the present time?—The tenant must first set the Act in motion. I may say that I act as much for the one as for the other. I have often thought that is an injustice.

17,543. I know that you have been largely employed both for landlord and tenant and that is the reason why I ask you for this information, which would be of great value to the Commission. Then you say also that the incoming tenant when he enters a farm that farm should be reported upon so that it might be a guide to direct the parties both as to dilapidations and as to the compensation?—I think it would be useful, and I think it would be a very great assistance to the estate agent as well.

Mr. S. Rowland-son.
19 Apr. 1894.

17,544. Is any person better qualified than the agent to do this?—No, he ought to be qualified if he knows his business.

17,545. If he does not know his business?—Well, if he does not know his business, he ought not to be an agent upon the estate.

Arbitration.

17,546. Then about the difficulty as to the expense of the procedure under the Agricultural Holdings Act. What do you say as to the quarrelling over arbitrators and referees? We have had it pretty plainly stated that the County Council should name a certain number of referees to lay before the Board of Agriculture and that their professional assistance should be used when it was wanted?—I think that would be a very great safeguard, and would, in many cases, simplify the expense in many arbitrations, and I hope that you will do away with a certain class of men that I should like to see eliminated.

17,547. You think that those referees should be drawn from practical agriculturists, farmers, and land agents that are practical men?—Certainly.

Law of Distress.

17,548. What is your opinion about the law of distress?—My opinions as to the law of distress are pretty well known. I should like to see the law of distress distinctly abolished, but I do not think that since it has been reduced to one year, it has had the same effect as it had, when there were six years.

17,549. But still you would have it reduced to six months, the same as the record in Scotland?—Yes.

17,550. We have been told that it benefits the small farmer?—I very much doubt it. If it does benefit the small farmer, it benefits him at the expense of the capable man, also a small farmer.

17,551. How does it suit the common trader?—It is distinctly against him.

State loans.

17,552. You say you are in favour of granting state loans for the purpose of agricultural improvements. May I ask you what per cent. you would like to be charged on the money lent?—At as low a per-centage as the State can possibly afford to lend it.

17,553. What do you consider a proper per-centage?—That question I have not gone into. If those loans are spread over 30 or 50 years I think the money might be lent out at a very low rate of interest.

17,554. What interest would you say?—Three to three-and-a-quarter per cent.

Payment of compensation.

17,555. (*Mr. Chaplin.*) One word about home grown corn. You say, of course, the tenant must give proof that it has been consumed?—Certainly.

17,556. Can you suggest any means by which satisfactory proof can be given as to how much is consumed?—I think you might come at it in one way. There is no doubt it is increasing the cost of the arbitration to a certain extent, but supposing they were allowed for, if one man or two men were to go and see the crops, and put their value upon the crops in the Autumn just before the harvest, then you could deduct from your estimate the amount sold off. That would be to a certain extent a check, and he might, when he sends the meal to get it ground, produce his quantities.

17,557. But is not that suggestion open to this difficulty: that in 99 cases out of 100 the tenant is not going to leave? The tenant hopes that things will be better, and means to stay on, and yet in order to carry this out the valuation of every farm must be taken every year in case he should leave?—No, only in the case of those who have given notice. I may state with regard to this that I have been always opposed to it up to the present time, but owing to the very low price of wheat, I think that it is most absurd for a man to sell his wheat at the present time.

17,558. (*Viscount Cobham.*) Would you restrict this compensation to the last year?—No, I think he might be fairly entitled to a couple of years.

17,559. (*Mr. Chaplin.*) The compensation that he would be entitled to upon the estimated manurial value?—Yes, it would be one-fourth and one-eighth in our neighbourhood.

17,560. But your proposal clearly is thus: that it can only be carried out by the means you propose, namely after a tenant has given a notice to quit, then a valuation should be made?—That is the means that I suggest.

17,561. His crops must be valued while they are standing, and an estimate made of what he has probably consumed?—Unless you are satisfied that he is giving a true account.

Mr. S. Rowland-son.
9 Apr. 1894.

17,562. (*Viscount Cobham.*) That does restrict it to one year practically?—It does not exactly restrict it to one year, because if you had fairly good proof what the farm was producing in one year, it would be a guide for a proper allowance.

17,563. (*Mr. Chaplin.*) But the amount of his crops might be very different from one year to another?—They might be.

17,564. So that you see difficulties?—I see difficulties about it, but I think that it is absurd that a man having to sell wheat at 25*s.* to 26*s.* per quarter, should be able to cart it five miles to a market and re-purchase the same amount, and yet be paid upon the one and not upon the other.

17,565. I agree that there is a great deal to be said on both sides?—Yes, there is.

17,566. With regard to the proposal that has been made that a record should be kept of the condition of the farm both on quitting and entering. What is usually your experience as to the condition of the farm when it is left? Is it generally, or in the majority of cases, in better or worse condition than when it is entered upon?—I have seen them both ways.

17,567. What is the general drift of your experience. Is not it usually the case that the condition of the farm is worse upon entry more commonly than the other way?—Well, I have known farms considerably improved.

17,568. In some cases; but in the majority of cases it would probably be the other way?—Probably it might. I do not know that there is very much balance in that way.

17,569. If that was the case it would rather hurt the tenant?—I might say that I have to go over a large farm within a fortnight from this time, and I have heard that the tenant has very considerably improved it. I have not seen it yet.

Relations between landlords and tenants.

17,570. You told us that the relations of owners and tenants in your district were very friendly. Would you go so far as to say this: that as a rule you can get any reasonable amendments or alterations in the agreement upon which you hold the farms there, if desirable?—In many cases you have. A great difficulty very often arises; when the solicitor happens to be acting as agent.

17,571. Where there is a solicitor instead of a practical agent then difficulty often arises?—Quite so; where there is an incapable agent.

17,572. That is from ignorance of their business?—It is; but if we have an agent who is a practical man we have not the difficulty.

Reduction of rent.

17,573. You have been able to make your demands felt where you have asked for a reduction of rent?—I may say this, that my landlord has always behaved well.

17,574. Would that apply generally in the district?—I might say that I have spent thousands of pounds upon the farm that I hold under him, and I am trusting in his honour; I have known him, and his father before him.

17,575. I think yours is rather an exceptional case, but what I should like to know is, generally speaking, whether tenants have been able to get a reduction where it is fair and right to have it?—It has been very often left to valuation, and I have valued thousands and thousands of acres for reductions of rent. Sometimes I have acted for both; sometimes for the tenant, and sometimes for the landlord. I have had a great deal to do with a number of farms belonging to the Duke of Cleveland in 1881, and also Mr. Bowes and others.

Deterioration of farming.

17,576. I think in your proof you say that there has been great deterioration generally in the cultivation?—Yes, there is a deterioration, decidedly.

17,577. And that is owing to bad seasons and bad prices?—Partly to bad seasons and partly to bad prices, and to tenants having lost hope.

17,578. The occupying owners are the greatest sufferers of all?—I think they are; they are hit both ways.

Causes of depression.

17,579. So that it comes to this; that although amendments of the Agricultural Holdings Act may be

very right and desirable, you would not go so far as to say that any alteration of any of the provisions of that Act by way of giving compensation to an outgoing tenant would be in itself a remedy for agricultural depression?—Certainly not; it would not advance prices.

17,580. The real causes are bad prices and bad seasons?—Yes, and the reduced demand owing to bad trade in the district, and also the very great number of labour disputes which interferes with the trade of the country.

17,581. There could be no effectual remedy then except by an improvement in these respects?—There is no doubt about it.

Condition of labourers.

17,582. The labourers you say are better off than they used to be. Is there as much employment in your district for them, or is less labour employed?—I do not think there is much less labour employed. Ours is a district where a great number of roots are grown, and a large quantity of stock is kept.

17,583. The labouring class have not suffered?—I do not think they have suffered.

Reduction of rent.

17,584. (*Mr. Lambert.*) You said that some farmers who had been farming highly had not got as much reduction as those who have impoverished their farms?—That is so.

17,585. What is the reason for that?—Because in some cases that I know of, advantage has been taken to a certain extent when the farm is in a good state, where the tenant will not leave if he can come to any reasonable terms, and in the same way a tenant has remained in some cases where the farm has been really in a bad state, and it would not be taken because it was only worth so much.

17,586. So that the landlord in that instance has taken advantage of the high farming of the tenant?—I know some cases distinctly where that has occurred.

Drainage.

17,587. You say that the increase of your own rent was on account of the drainage payments not having expired?—That was drainage done under the lands improvement at 6¾ per cent.

17,588-90. What is the time limit which would presumably exhaust the value of the drainage?—Well the number of years taken by the Lands Improvement Company was 22 if I remember rightly. The arrangement with my landlord is 24 years, but I think that where the whole money is paid a very fair arrangement would be 28 years.

17,591. Has the drainage or the value of the drainage to the land expired at the end of 25 years?—No, I do not think it has. It depends very much upon the land, some drainage will last much longer than others. Drainage that has a good fall will last longer than a flat drainage.

17,592. Would you be in favour of a tenant breaking a piece of land on giving the good value that has accrued to the incoming tenant?—That is practically the free sale of his full improvements in the farm.

17,593. No; if a man came in and took a piece of land at 15*s.* an acre and left it worth 25*s.*, would you give him the capitalised value when he quitted?—That is very difficult indeed to estimate. I have been over a great amount of drainage in Northumberland and in a dry season like this it is very difficult to say how much is due to the season and how much is due to the system of drainage. I do not know how you would estimate it.

Payment of compensation.

17,594. Would you affirm the principle of giving the tenant compensation for the improvements that have increased the lettable value of his holding?—I do not believe in the free sale system.

17,595. That is not free sale?—It is practically so. I will put it in this way; it would be much more satisfactory both to the owner and the occupier if the improvements were scheduled under the Act than to give the tenant the free sale of all that may have increased the letting value of the farm up to the time that he goes out.

17,596. I was not suggesting free sale; that means that he would put his improvements up to auction to any one. I was suggesting that the compensation should be made by valuers as at the present moment?—Then I do not think that the valuers could estimate that compensation.

17,597. So that you do not think that the valuers are competent to estimate?—I think in one case they might estimate at very much more than it is worth, and in another case, owing to the adverse season, at very much less.

17,598. But if they are judges of their business they could do that?—I do not think so.

17,599. So that they would not take the season into consideration in estimating the compensation?—They would probably take the season very much into consideration, but they might give an allowance for drainage owing to a dry season, thinking that the drainage was right, whereas the drainage was wrong, but the land looked dry owing to the season.

17,600. I do not want to go into the difficulty of estimating the compensation; I want to know the principle to go upon?—I would much rather pay upon the proved expenditure and allow a certain number of years upon that.

17,601. There you rather estimate the compensation upon outlay rather than on the value of the holding?—I think so, because I think it is much safer to both parties. The landlord must be carefully guarded to see that the money is properly expended.

The letting of farms.

17,602. Do you get a good many applications for farms?—Nothing like the applications for farms that we had in the 'Sixties and 'Seventies.

17,603. What would be the size of the farms?—Farms of any size with us.

17,604. How many applications would you get for a farm of 200*l.* a year rent?—A gentleman told me the other day that he had, I think, 12 applicants for a farm of 1,200 acres.

The fixing of rent.

17,605. How are the farms let, how is the rent fixed?—The rent is fixed between the agent and the tenant.

17,606. But would the would-be tenants bid one against the other?—They are not fixed in that way. In a few cases they are put up to competition, but especially on the large estates they are not put up to competition. As a rule the owner selects the best tenant he can get hold of on the condition that he pays the old rent or what he considers a fair rent.

17,607. You would schedule all the fields upon the farm, I understand?—Yes.

17,608. Would not that raise to an enormous extent the expense of valuers and such like?—That might be done as I said before for an expenditure of 10 guineas on a 400 acre farm. I think it would be well worth while to do it.

17,609. You told us that you gave evidence before the Duke of Richmond's Commission which sat on agricultural depression?—Yes.

17,610. I understand you to say that in your judgment agricultural depression has been continuous since then, and is worse now than it was then?—I consider so.

Fall in prices.

17,611. And that the fall in prices is the cause of that depression?—I think that I may say fairly that at the present moment the depression is as much felt, if not more than ever it has been, in our neighbourhood, especially owing to the very low price of beef, because we are large feeders in our neighbourhood, we feed a very great number of cattle, and it has hit us very hard indeed.

17,612. I see you do not appear to have attributed any attention to the connexion between the fall in money and the fall in prices?—I have always left that question to the specialists.

Payment of compensation.

17,613. In the case of farms passing from hand to hand, are not allowances ordinarily made in your district by the valuers for unexhausted manurial value; have not you some rough and ready plan among yourselves of giving some compensation?—Yes.

17,614. Who pays for that unexhausted manurial value?—The entering tenant as a rule.

17,615. I notice that you said you thought more compensation ought to be given in cases of continuous high farming than is given now?—Yes.

17,616. Would you have that paid for by the incoming tenant, or by the landlord?—Paid for by the landowner, because the rent would depend upon that.

17,617. In that way it would naturally be so, you would not make the incoming tenant pay twice for it?—Certainly not.

17,618. (*Mr. Gilmour.*) Going back to this question about getting compensation for high farming; you have admitted that there would be very great difficulty

Mr. S. Rowlandson.

19 Apr. 1894.

often in carrying it out, perhaps by valuing the standing crops?—There is a difficulty.

17,619. Would it not be a simpler way probably if a man could produce proper farm books with accounts for several years back, and take that as the basis?—There is no doubt about it, but you would only get that in one case out of a hundred.

17,620. But if it became known, would it be an inducement for them to keep books?—Yes.

17,621. And that would be not only an advantage to the farmers on that particular point, but in connexion with all their business?—Certainly.

Claims and counter-claims.

17,622. We have had put before us by another witness that, in his opinion, it would be a good plan for the tenant to deposit his claim for compensation, say two months, before the termination of the tenancy, and the landlord one month, thus giving before the termination of the lease an opportunity for the tenant to put to rights probably a great deal that the landlord claimed upon, would you think that that was a workable and a good plan?—I think it would be very much better if both claims were handed in on the same day.

17,623. Do you think in country districts it would be possible actually to get those claims into the hands of some person exactly on the same day?—Yes, there is no difficulty at all about it; not the least that I can see.

17,624. You do not think it would be any benefit if the landlord's claim were sent in a little after the tenant's claim?—I think they ought both to be delivered on the same day.

17,625. What time should you give before the termination of the lease?—As near to the expiration of the tenancy as it possibly could be, and I would also give the landlord 14 days after the expiration of the tenancy for any valuation that would take place with regard to removal of fixtures.

17,626. How many days or weeks before the termination of the lease should the notice be delivered on both sides?—I would suggest either a week or a fortnight before the expiration of the tenancy in order that the tenant should make out a full claim for the consumption of cakes and feeding stuffs as close as he possibly can according to the nature of the tenancy.

17,627. If they both be delivered at that very short time the tenant would have no opportunity of effecting any small improvements such as cleaning drains and fences and sorting gates that he would have under the proposal put forward by another gentleman?—He might do that, but it is very seldom that the tenant would do those improvements, they invariably go to valuation.

17,628. But if the tenant sees it in black and white that the claim is made upon him would it not be simpler and cheaper for him to effect these improvements rather than to face that thing?—I do not think it would for this reason—close to the expiration of the tenancy the outgoing tenant is very busy also in entering upon his new farm and this work would very likely have to be done without his direct superintendence, and he being away at his new farm he would probably pay less under a valuation than he would do in doing the work himself in that way.

Payment of compensation.

17,629. (*Mr. Little.*) As to compensation for home-grown corn it is a difficult subject, but it is not much more difficult than several other matters which a valuer has to investigate?—As I said before the difficulty is not insuperable.

17,630. Where a man gave satisfactory proof he would get compensation, and where he gave no proof he would not get it?—Certainly that would be so.

17,631. There would be no unfairness in prescribing that compensation should be given on due proof?—There are cases where there would be very great difficulty in finding out the proof of the consumption of corn grown on the holding.

17,632. And the use of manures?—Yes; and especially where a man has more than one occupancy, and I may state with regard to that wherever any difficulty of that kind occurs I never would give more than an average on the whole occupancy.

17,633. Then I understand you to argue that the effect of good farming is cumulative?—Yes.

17,634. And that the custom of giving a regular allowance in all cases of a certain proportion is not fair to the man who is above the average in farming?—It is not, and I may state that the very first award under the Agricultural Holdings Act which I gave was in a case near Masham in Yorkshire. I gave a distinct intimation that I had allowed over and above the two years and I fully expected that that would be appealed against, but it was not. I gave it because I saw that there had been undoubtedly upon the gross land a very large amount of cake consumed, and no doubt it was a very considerable improvement. It was the first award I gave, and I wanted that point decided.

17,635. There could have been an appeal on the ground that you had based the award on expenditure and not on the value to an incoming tenant?—Yes.

17,636. The appeal could have been made on that ground?—Yes.

17,637. You remember Sir John Lawes' argument some years ago, that cake consumed and the manure well taken care of was by no means exhausted in two years, and that it might last for three, or four, or five years?—Yes.

17,638. And that if the manure was used or employed in growing increased crops and these were consumed on the farm the fertility would be correspondingly increased?—Of course there is a vast deal of difference. In some farms it is properly taken care of, and in others it is neglected. I have had cases where I would not allow the full value, and these were cases where I found that the manure had been neglected.

17,639. But you find a tendency to settle compensation by a regular scale?—Yes.

17,640. And you think that that scale is unfair to the farmer who is above the average?—Yes, and the longer this goes on the more likely to my thinking is it to become a regular custom, and the more difficult it would be to upset.

17,641. I understand you to say that landlord's dilapidations should be scheduled, and his claim confined to the Act unless the tenant is allowed to claim under custom and agreement as well as under the Act. Cannot the tenant claim under the custom or an agreement?—He can claim under agreement, but there is always a very great difficulty.

17,642. He has a claim under an agreement for his tillages—the farm work?—Yes.

17,643. And the landlord can claim either at common law or under the Act?—Yes, I think it would be better to claim under the Act than to have to go to common law, because the landlord does not like to go to common law. There is a very strong feeling as to deterioration, and I certainly think that there are many instances where the tenants have escaped due punishment, because the landlord is not allowed to claim, owing to the tenant not having put in his claim.

Cross-cropping.

17,644. With regard to cross cropping, you say that it should not be a dilapidation unless the land is left foul and deteriorated. Do you propose to alter the liability of the tenant by law or simply in practice—that compensation should not be given unless there was a real damage?—I think it would be better if it was laid down. Of course it is a pretty well understood thing that you must prove damage if you go into court—that the penalty is no use—the penalty you never get—you simply get the deteriorated value, whatever it may be.

17,645. Would you like to see that put into the Act—that the dilapidation should not be charged unless actual damage is done?—I think so.

17,646. (*Mr. Dalton.*) Are profits made in your district by farmers at the present time?—None.

17,647. None whatever?—That I think I can answer straight.

Rates.

17,648. What are the average rates in the district?—They vary in different places; I think I may say that they will run from about 2*s.* to 2*s.* 6*d.* in the £.

17,649. Have they gone up or down of late years, or have they remained stationary?—Pretty stationary.

17,650. Your remedy is that the land should be rated at one-fourth, or have you any other remedy for reducing the rates?—I said with regard to the Parish Councils that the land should be rated at a fourth, instead of at the full value.

Maintenance of paupers and lunatics.

17,651. You think that the rates should be reduced; have you got any particular plan for bringing that about?—I quite agree with Sir Massey Lopes, who has just given evidence, with regard to lunatics. I have always thought that the lunatics ought to be a national charge.

Mr. S. Rowlandson. 19 Apr. 1894.

17,652. With regard to the maintenance of paupers, what do you say?—I think that might also be made a national charge.

17,653. You do not think that it would lead to the refusal of out-relief?—I do not think it would. I have been a member of the Board of Guardians and Vice-Chairman, so that I have some experience.

17,654. Is there more out-relief than indoor relief?—Indoor relief is a very small proportion.

17,655. You do not think it would increase?—No. In our union the proportion is 780 or 800 outdoor or about 170 indoor paupers.

State loans.

17,656. With regard to State loans for land do you think that they should be lent by the State or the County Council?—I think it would be much better lent by the State.

17,657. You have a precedent in the Small Holdings Act, for the lending of money by County Councils for the purchase of small holdings?—Yes, you have.

17,658. Do not you think that they might more readily ascertain the local circumstances than the central authority in London when they wanted money?—No; I think an inspector would be sent over, who generally knows the property.

17,659. They could borrow at very nearly the same rate of interest?—Not so low.

17,660. But you know that several County Councils have raised money at three per cent.?—We have not raised any.

17,661. You would have no difficulty in raising it at three per cent. stock?—I do not know; we have not raised any yet.

Compensation for improvements.

17,662. (*Viscount Cobham.*) Under the Agricultural Holdings Act does it not frequently happen that the landlord pays the compensation?—Probably.

17,663. But as a rule the incoming tenant pays?—The incoming tenant pays. I have known an odd case or two in the case of a farm a good deal under condition that the landlord could not get his farm let unless he paid, but that practically comes to a bargain between the incoming tenant and the owner if there is likely to be no alteration.

17,664. Under the suggestions which you have made it would be probable that the landlord would have to pay much more frequently?—In the suggestion I make it would be very much indeed for the benefit of the owner, and also for the community at large with regard to good farming, because you generally find that if a tenant knows some time before that he is leaving he does not farm so well during the last year or two, and it would be an inducement for him to keep the farm in good order.

Mr. S. Rowlandson. 19 Apr. 1894.

17,665. But it very often happens, in the south at all events, that rents continue to fall notwithstanding the efforts of improving tenants?—Rent is much more likely to fall with a farm out of condition than in the case of a farm that is really in good condition.

17,666. But there are certain landlords who would put up with a considerable reduction in rent rather than pay a considerable lump sum on the spot?—It is bad policy.

17,667. Are you not making it rather the interest of the landlord not to get improving tenants?—I had a farm myself which I let at 50 per cent. reduction, simply and solely because it was out of condition. And I not only let it at 50 per cent. reduction, but I had to expend 5,000*l.* in putting up some new buildings and new houses and otherwise assist in putting it in order.

17,668. Would not it be perfectly possible for a farm to be cultivated by an improving tenant, and still at the end of the tenancy the rent might fall?—That might be; that would be so if the rent was high before.

17,669. Is not it a pretty common occurrence in the middle and south of England?—It may be.

17,670. (*Mr. Clay.*) You think that land is more benefited by a tenant leaving a farm in good condition than in bad condition?—There is no question about it.

17,671. And even a small compensation would be infinitely better than allowing it to go out of condition?—I may state that a farm which I entered upon was where there was a mortgagee in possession, and the farm was in a disgraceful state, and it is going to cost me quite 5,000*l.* before I put it into fairly good condition. It is let at 50 per cent. less than it was at one time, and 50*l.* a year less than the outgoing tenant offered me for it with no expenditure.

17,672. And the tenant who has gone on improving it is not half so well off as the man who has been slovenly with his farm during the last two years?—I quite agree with you, I would rather take a farm in good condition than one in a bad condition. I took one farm at 400*l.* rent in bad condition, and I know what it cost me. You can very soon spend 400*l.* a year.

17,673. (*Viscount Cobham.*) Would you make permanent improvements without the consent of the landlord?—Some improvements.

17,674. What class of improvements?—I would allow him to do drainage.

17,675. But not substantial building?—I do not think I should.

The witness withdrew.

Adjourned to to-morrow at 12 o'clock.

Thirty-first Day.

Friday, 20th April 1894.

PRESENT:

The Right Hon. GEORGE JOHN SHAW-LEFEVRE, M.P., in the Chair.

Viscount Cobham.
The Right Hon. Henry Chaplin, M.P.
Sir Robert Nigel Fitzhardinge Kingscote, K.C.B.
Robert Giffen, Esq., C.B.
Charles Isaac Elton, Esq., Q.C.
Captain Owen Thomas.
Francis Allston Channing, Esq., M.P.
John Clay, Esq.
Cornelius Neale Dalton, Esq., C.B.
Robert Lacey Everett, Esq., M.P.
John Gilmour, Esq.
George Lambert, Esq., M.P.
William Cutlack Little, Esq.
Walter Hume Long, Esq., M.P.
Charles Whitehead, Esq., F.L.S.

Herbert Lyon, Esq., *Secretary.*
R. T. Crawford, Esq., } *Assistant*
Freeman Thomas, Esq., } *Secretaries.*

Mr. Albert Pell called and examined.

Mr. A. Pell. 20 Apr. 1894.

17,676. (*Sir Nigel Kingscote.*) Perhaps you will state to the Commission the number of acres which you own, and which you have in hand and are farming?—I occupy at the present time 1,034 acres of

Mr. A. Pell.
20 Apr. 1894.

land in the Isle of Ely, which I own jointly with my brother, who is in the Church, and who has nothing to do with the cultivation or management of the property. In Northamptonshire I rent 283 acres of land, therefore I occupy and manage 1,317 acres. I am also owner jointly of the Manor of Wilburton, which is a manor with a considerable amount of copyhold property. It is a valuable manor; it is not a reputed manor, and I am unfortunately the lay rector and the owner of the tithes of Wilburton. I was Member of Parliament for Leicestershire between 17 and 18 years, and I would add also that I am a Governor of Guy's Hospital, and have had for some time, jointly with two other Governors, the surveillance of the landed estates of Guy's Hospital, which are very considerable. I am on the Council of the Royal Agricultural Society of England, and Chairman of the Executive Committee of the Cambridge and Counties Association for procuring and supporting a course of scientific instruction in subjects bearing upon agriculture in the University of Cambridge. In 1879, with Mr. Clare Sewell Read, I visited America as an Assistant Commissioner on the Duke of Richmond's Commission.

17,677. Then we may take it that you are very well acquainted with most of the districts in the south and midland counties of England, perhaps in the north, too?—Not in the north, except by visiting friends, and travelling there. I am well acquainted with Cambridgeshire, and very well, I think, with Middlesex, having begun farming there many years ago, and with Leicestershire and Northamptonshire, of course. I live in Northamptonshire.

Description of land occupied.

17,678. Will you state generally the nature of this land which you occupy?—The 1,034 acres of land which I occupy and own in Cambridgeshire is of very first-rate quality, and probably some of it not to be surpassed anywhere for its productive powers.

17,679. Is it chiefly arable?—We have laid down anything that would not plough with a pair of horses. We have laid down, I think, between 200 and 400 acres in the last 15 years. There is a little inferior land in the parish of Wilburton. Then in Northamptonshire the land which I rent there is mixed and not productive land. It has a better appearance than justifies its character.

Existence of depression.

17,680. Now as to the depression in agriculture, do you consider it is universal throughout England?—As far as my knowledge goes, it is universal. I do not know any agricultural district which has been spared at all.

17,681. But it has been felt more severely in some parts than in others?—It has been felt most severely in Essex, and upon the Guy's Hospital estates there. I think the Commissioners have had some evidence from Mr. Strutt, who is our agent there, but I may say that I have been over all the Guy's Hospital property there more than once.

17,682. From when do you date the depression?—I should say it was first felt in 1879. In 1879 we had an unusually bad season, and that was accompanied by very low prices. 1879 was the the time when people really first got alarmed.

17,683. And from that time to this?—From that time to this I do not think there has been any recovery—there has been no substantial recovery, at all events.

Extent of depression.

17,684. Have certain lands or certain districts felt it more than others?—Yes, I think the lands that have felt it least of all have been the best lands, especially the best grazing land. There is a considerable amount of grazing land in Leicestershire which has been let for three guineas an acre, and I think the rent upon that land has dropped very much less than the rent upon land below it in quality. The land where I think the greatest drop in rent has been, and the most disappointing land to the farmers, has been the land which was considered medium land, and which had been raised to a temporary state of fertility by improvements, the fertility of which, had times been good, would have been maintained, but when times became bad and people became discouraged, they were less generous to the land, and the land fell back and asserted its old inferiority, and the rent therefore has dropped very much.

17,685. Has some land become derelict?—Yes; there is some derelict land that I have been over in Essex, but in travelling, which I have done lately, this year, between Malton and London, over the Great Northern Railway, I only noticed one bit of derelict land all the way down. That has been derelict for some time, and even there I noticed that part of it had got covered with grass, and there were sheep on it. It is a long journey, and that is the only piece of derelict land all the way down.

Mr. A. Pell.
20 Apr. 1894.

17,686. In any other case have you seen it?—No, I do not think I have myself.

17,687. Have you any opinion as to whether the depression has been felt most upon highly cultivated land or where it has been only moderately cultivated?—It would be very difficult to say. I do not think I have formed an opinion upon that point. The highly-cultivated good lands have certainly suffered less; I think the highly-cultivated bad lands have suffered very materially.

Result of high farming.

17,688. Do you consider that high farming would reduce the loss owing to the lowering of the price?—I agree with Sir John Lawes that high farming is no remedy whatever for bad prices; but a farmer who attempted to meet the times by bad farming is more likely to get into difficulties than by leaving it alone.

Character of cultivation.

17,689. Have you seen much difference during the last few years in the cultivation of arable land, whether it has deteriorated for want of working or not?—The arable land is a very reduced quantity now compared with five or six years ago, but I think that it is as well or better cultivated now than five years ago. People have settled down to the difficulties of the times, the land is rented at a lower rent, and people know more what they have to face, and they are concentrating their capital and energies on a smaller area of arable land.

17,690. The result is that some large farms have been divided?—Yes, undoubtedly they have, that has been very much the case.

Land laid down to grass.

17,691. For the benefit at all events of the cultivation of the land?—Yes, and even where large farms have not been subdivided a very great portion of those large farms has been laid down to grass; and therefore that has left a smaller quantity of arable to be cultivated.

17,692. Is having part of these large arable lands laid down to grass a benefit to the rest of the farm?—Yes, I suppose it is. Of course it depends entirely upon the price of straw and stock and sheep whether it is going to pay or not. The newly laid down lands can do nothing in the way of feeding oxen.

17,693. But still it is an economy at all events in labour?—Undoubtedly, and a great advantage to the landowner, because when the land is laid down it is all the time accumulating fertility; it is a savings bank for the landowner, there is no doubt about that.

17,694. Do you think there is a certain proportion of land that was broken up when the prices for corn were high that ought never to have been broken up?—I am clear on that, I have lived long enough to see the whole process from the time that we had free trade. A great deal of the land was broken up then which had very much better have been left alone. Of course the breaking up of the Down land was simply suicidal. All history shows that that was a dangerous thing to have done, but still a great deal of it was broken up.

17,695. And a great deal of that land is still less fertile than it was and will be for many years?—Probably it would be half a century before it would recover itself.

Character of buildings.

17,696. As regards buildings have you observed that the buildings have been deteriorated much?—Yes, there is a good deal of dilapidated buildings to be seen—buildings that are not maintained in thorough repair, and perhaps it would not be well to do so. Take these very large barns, one does not know what to do with them. In the fens we have enormous barns which are unserviceable, and one does not know whether it is well to repair them. One does not like to see anything going to waste, but that sort of building is not kept in very good order in some cases. There were 30 or 40 years back, many buildings erected which are not wanted now, and the owners have perhaps, not the means, at all events they have not assisted to keep them in very good repair.

17,697. But mostly where buildings are being renewed and set up there is a great deal done in the way of labour saving by concentrating those buildings much more than was done formerly?—I think so. People who are putting buildings on land are copying the railroad companies, and putting up wooden buildings upon brick foundations covered with pantiles instead

Mr. A. Pell.
20 Apr. 1894.

of slate, and indeed in Lincolnshire a great deal has been covered, and covered with great advantage too by wood—nothing but boards.

Prices in 1879 and 1893 compared.

17,698. Now will you turn to the causes of depression. Can you give the Commission any of the prices of 1879 compared with the prices for 1893?—Yes, I think I can. Take wheat; in 1879 the gazetted average for the year was 43*s.* 10*d.* the English quarter, and in 1893 it had dropped to 31*s.* 4*d.*—I took that price of 31*s.* 4*d.* out of tables for the purpose of tithe commutation. That shows a decrease of 11*s.* 6*d.*

17,699. That price would hardly be given now for wheat?—Oh, dear, no. I have been selling splendid wheat at 24*s.* a quarter in Cambridgeshire. Then barley was at an average of 34*s.* in 1879, and in 1893 it had dropped to 26*s.* 8*d.*, being a drop of 7*s.* 4*d.* in the quarter of 8 bushels. Oats were 21*s.* 9*d.* in 1879, and they had dropped to 18*s.* 2*d.* in 1893, being a drop of 3*s.* 7*d.* Then taking the whole of the grain together, by the tithe commutation returns I find that the tithe in 1879 was 111*l.* 15*s.* 1½*d.*, and that it dropped in 1893 to 74*l.* 15*s.* 2¾*d.*, being a drop of 34*l.* in the tithe commutation—very nearly one-third—more than one-third of the tithe commutation at 100*l.*, and really going on to one-fourth the old price of 1879 which was 111*l.* Then wool; I fancy that Leicester-wool, long wool alone, has dropped from 25*s.* in 1879 to 22*s.* in 1893, but I should like to say this, that wool in 1879 was not selling at a very high price. I have sold the same sort of wool which was quoted at 25*s.* in 1879 as high as 63*s.* not very many years before. I looked back through the ledgers of my farm and found that was the case. Short wool and half-bred wool has maintained its price better than long wool.

17,700. Can you tell us anything about butter?—Butter has dropped in price since 1879, but it has not dropped in price since 1840, or going back to 1850. Milk has dropped since 1879. Excluding this last winter when we had better prices it has dropped about 1½*d.* a gallon, wholesale, in London. I send a good deal of milk to London from Cambridgeshire, and have also sent some from Northamptonshire, so that I am acquainted with the prices of milk.

17,701. Now as to the prices for the different qualities of dead meat and other things?—I think that the best qualities of meat, and of poultry, and of cheese, and of eggs have not gone down in the same proportion, if at all. Good Devon beef and small Southdown mutton, and small Herefords, and good poultry such as from Guildford, and good eggs have not gone down. The common egg tasting of straw has dropped in value.

17,702. What have you to say as regards the price of foreign feeding stuffs and artificial manures?—They have dropped very much indeed. Cotton cake and linseed cake, and artificial fertilisers have dropped in price, and also nitrate of soda, and I think, especially, sulphate of ammonia and superphosphates.

Causes of the fall in price.

17,703. What in your opinion has been the chief cause for the fall in price?—Well, the immediate cause has been foreign competition; the introduction of a great quantity of stuff from over the sea which has been of late years, and every year, brought in upon the easiest of terms to the freighter by the improvement in the steam-engine, by the introduction of steel into the building of the ship, which has greatly increased its carrying capacity, and so forth. Then there is a general reason to my mind which is hardly sufficiently considered, and that is the extraordinary competition there is going on among us all, the endeavour universally to beat down the inventor. When a man has brought out a labour-saving machine, or some method of conducting his business in an economical way, he is not very long left in possession of the advantages that he obtains in that way. All over the world there are people immediately ready to improve upon his invention. Directly the invention is improved upon, that man *pro tanto* is damaged in his income, and in many cases entirely ruined. Take a very common illustration. Look at the history of the carrying by sea; the sailing ship gives way to the steamboat—the paddle boat in the first instance. The sailing ship is nowhere. I can remember the day when these paddle vessels came upon the scene, and now the paddle boat has gone. Then came the screw steamer, which knocked the bottom out of the capital put into the paddle vessels; then there came the expansion engines—triple expansion engines, and now quadruple expansion engines, which will probably damage and seriously injure the capitalist with engines already built.

17,704. And this enables, in your opinion, the steamboat and other companies to bring this foreign produce at a very cheap rate?—Certainly it has; but I also want, if I may be permitted to do so, to point out that it is not land only or farmers only that are suffering from this, but all other industries are suffering in almost exactly the same way. There is hardly one that can be named which is not suffering from this fierce competition which is going on in the human brain, you may say, in the ingenuity that a man shows to break down his neighbour's advantages, whether it is in land or in farming, or in trade, or in the production of some articles of commerce.

17,705. Are you aware whether the quantity of flour that comes over now is increasing?—Yes.

17,706. Do you consider that it is a great loss to the country in not getting the offal of that wheat, or whatever it may be?—I think that is a very great loss to the country. Of course, I do not see any way to obviate it, but the offal from wheat is now, I believe, I speak with some hesitation, but I think that it is worth nearly as much as wheat itself per ton.

17,707. And that is all lost to this country?—Yes; not only that, but I think that we get inferior bread; the white bread from roller mills is very unsatisfactory eating.

Reduction of rent, and assessment to rates.

17,708. Now would you turn to the next subject. What complaints of the depression do you hear, and what do you hear are the causes of the depression?—I take it that what practical men complain of is not so much the reduction of rent as the slow way in which the reduction comes. I am chairman of the assessment committee of the union where I live in Northamptonshire; and there I have got my committee to make it a canon that rent is to be the absolute criterion of the assessment to the poor rate, and therefore I have the opportunity of seeing all the agreements, or failing the agreements, the receipts for rent brought into the room by the tenants who object to the valuation. I have constantly had this sort of case come before me. A man says, "Well, sir, I have got no reduction on my rent, but I "have got an abatement, I have got a return, an "allowance." I am always obliged to say, "I cannot "do anything for you to reduce the assessment." I have known cases go on for two or three years before the man has got a reduction of the rent and before he has been able to say, "There is a new agreement with "my landlord; he has granted me a real reduction in "rent" I think that they do complain of that, but I do not say that the landlords are to blame for a moment, because it is the fact that men would not make permanent reductions of rent without a very great consideration as to whether time would not set them right again.

17,709. Latterly has the reduction been made permanent so that you could on the assessment committee meet it?—It has, to a very large degree. I am clear that the reduction of rent in the union of Northamptonshire, where I live, amounts to from 34 to 35 per cent. since 1879, or since a later period than that. Then men complain of the slow drop in the tithe rent-charge. One complaint among the farmers which was more rife a little time ago was that the tithe should not be based upon the seven years' valuation of grain, but upon the current year, but latterly you do not hear much of that. Still it was one cause of complaint.

Income tax.

17,710. As to the taxation, what do you say?—Well, as to inequitable taxation, I would say that complaint is very rife among the landowners and among the tenant farmers. Take the tenants first, they think that they are taxed on profits which they have not made, paying under Schedule B. Well, the answer to that is complete at once—that they need not be taxed if they make no profits; and if they are so unwise as not to ask for the return under Schedule B. they must suffer for it. Then with regard to owners, there is a complaint which is very general—that they are taxed upon gross rent under Schedule A. Well, then, that is to my mind a real cause of complaint; that is to say, that if a man, a tenant, pays a landlord 100*l.* a year for rent, the landlord will have to pay 8*d.*, I suppose, now—previously he had to pay 7*d.*—in the £ upon 100*l.*, though he never received 100*l.*, having had to spend 10*l.* or 20*l.* for keeping up the farmers' premises in such a condition that the farmer is able to pay his rent. But a great deal has been done in the interest of men like myself, occupying their own land, through the Inland Revenue Department. There you are put in a very different position. For instance, take my own case at Wilburton. I am

Mr. A. Pell. 20 Apr. 1894.

taxed upon the whole income that I make from the estate as owner and occupier. All repairs that I do upon the property are taken off the gross return, whereas if I let the estate I should get nothing off the income tax. With reference to the repairs that have been done upon the property, of course, the Inland Revenue people naturally say that a builder's account putting up a cottage must not be classed among repairs. For that I should not be allowed any reduction; but, furthermore, I get another benefit by occupying my own land; if I am able to show that upon the estate there has been a clear loss—that I have lost by it, we will say, 200*l.* a year, and that I have received an income of 200*l.* from the London and North-Western, and paid property tax upon it, can I go to the Inland Revenue and ask them to return me the property tax that I pay on railway dividends, because of the loss of income on the estate I brought the memorandum "A. $\frac{2\text{-}93}{I}$" of the Board of Agriculture, with me, because I think it would be very serviceable to landowners, if the Commission would print it in the Appendix, It is a very well-known memorandum to people who look after their own business thoroughly, but I am surprised to find how many landlords and agents are not in the least acquainted with it. (*See* Appendix IV.)

Property tax.

17,711. Well, then, you gain very much by being an occupier as well as an owner?—I think I do with regard to the property tax, undoubtedly.

Rates.

17,712. Well then, as to the local rates, what do you say?—The local rates, of course, have been a source of dissatisfaction to the farming interest, and, perhaps, as much to myself as anybody, because I took a very active part in dealing with that question when I was in Parliament. I think that the system of rating is inequitable still, and that the occupiers and owners of land are specially rated for purposes for which they ought not to be rated. We got off, when I was in Parliament, a very large amount of the cost of maintaining the police, but not the whole of it. I do not see why there should be a special charge levied upon land, and upon the occupiers of the land, for the maintenance of the police, or for the courts of justice, and for the lock-ups in the petty sessional divisions. We got rid of the whole cost of prisons; that was something gained, but I cannot myself see upon what ground these special charges upon visible property can be maintained.

17,713. As regards lunatics, what would you suggest?—As to lunatics again, we cannot make lunatics as we can make paupers; we might have further assistance there. We do get considerable assistance from the State for pauper lunatics. I should like, if I might be allowed to do so, to point out what might be done in the way of relieving oneself from rates by better administration. I think that there has been very great neglect on the part of both the owners and occupiers of land in the administration of rates. There is a terrible waste, a most terrible waste from neglecting and from not dealing with the whole question economically. Now, I have brought a comparative statement with me of the rating of the union in which I live in Northamptonshire, and in which I have been a guardian for a very considerable time. If the Commission would allow me I would just give a statement of the benefits that union has received from a careful administration of the rates as we have got them. I suppose that within the last 16 years there cannot have been less than 70,000*l.* saved to the occupiers, and through them to the owners of land in respect of the poor rate alone—the administration of the out-door relief alone. I have some figures here which I should like to give to the Commission. The comparison is between 1893 and 1873. In 1873 the district paid 521*l.* for the maintenance of the indoor poor; in 1893 it paid 759*l.*; in 1373 it paid 5,660*l.* for the maintenance of the out-door poor—that was for the year ending Lady-day in every instance. In 1893 it only paid 177*l.*, and that has dropped still lower at the present time. Therefore, there is a clear saving of 5,500*l.* a year in that one item alone by good administration.

17,714. Do you attribute that to economy and good management?—Nothing but that whatever. In 1873 the lunatics in the asylums cost 420*l.*, now they cost 470*l.*; in 1873 the salaries of the officers were 907*l.* and now they are a little more—974*l.* In 1873 the other expenses were 782*l.*, and now they are 449*l.* Well, then there are the highways which cost us 800*l.* more than they do now; in 1873 the highways cost 3,692*l.* for the year, and in 1893 they cost 2,836*l.*

17,715. (*Mr. Little.*) Is that in a highway district?—It is for all districts.

17,716. No roads are taken out?—No, there is a contribution for the county rate for main roads.

17,717. (*Mr. Dalton.*) Does that account for the difference?—No, I think it is better construction. The surveyor understands his business of metalling the road better. The burials board stand by themselves entirely, and the sanitary authority stands by itself. We have very few school boards, thank God for that, and they do not come into the general expenditure of the union. The school attendance committee is a new charge; and registration for births and deaths about the same; vaccination expenses were more; they were 201*l.* in 1873, and now they are 54*l.*

17,718. What do you say as to the sanitary authority?—The sanitary authority spends as a union 266*l.* That is a general expense; the special expense would be very much heavier. A great many of the parishes are thoroughly sewered now.

17,719. Can you give the Commission what is the result as regards your rating in the £?—The rating in the £ I had got out for me yesterday. The rate for the maintenance of the poor for the whole year is 4½*d.*, and I suppose it used to be before I began the reform—it is difficult to say accurately—probably over 1*s.* 1*d.*, but if wished I can furnish you with that. I have not got the rate in the £ in 1873, because in 1873 the rate in the £ would give no measure really of the extravagance or otherwise. The assessment was good for nothing.

17,720. (*Mr. Lambert.*) Have you got the total amount of the expenditure in 1873 and 1893?—The total amount of the expenditure, taking in the special items and new items put on by modern legislation, the total expenditure for 1893 is 10,130*l.*, and in 1873, without all these new charges which have been imposed by modern legislation, you might say was 15,000*l.*; the actual figures are 14,950*l.* So that, of course, we have got a considerable relief in the district by better administration—a very sensible relief.

17,721. (*Sir Nigel Kingscote.*) Have you got anything else to say on the subject of rates before we pass to the next subject?—No, excepting this, that I think that the land is at a disadvantage in one way. What I would call the "fugitive" capital of an owner or a tenant in farming is rated directly. If I put 1,000*l* into my farm which I rent, which I could do by consuming cake and putting artificial manures and dressing up the land thoroughly well, I should be rated upon it because it would be said that the land would command a better rent, but if I put 1,000*l.* into loose frame work, machinery, and machinery in a factory in Leicestershire I am not rated at all. The assessment committee only gets the rate resulting from the assessment on the bare fixtures and its walls, but I can just almost as quickly remove this improving capital by scourging and by taking the inside out of the land in three or four years as I could by moving my frames out of the factory. Still, in the case of the land, undoubtedly the improvement would be rated, though it is of a very fugitive nature. It is not like putting a building on the land—that remains there. I think you know as well as anybody what face can be put upon land and on its condition by these temporary stimulants and operations.

17,722. You consider that the land thereby suffers, and it is not an equitable assessment?—I think it does suffer in England, but not elsewhere, bearing in mind the case of Ireland with Griffith's valuation, where the valuation appears to have been upon the inherent qualities of the land and its capabilities for getting rent. I hope it will not be thought that I am advocating anything of the sort; it is far beyond me to go into that question.

17,723. (*Mr. Lambert.*) What is the rateable value of your union?—The gross estimated rental of the union is 124,724*l.*, and the net rateable value is 106,416*l.*

17,724. (*Mr. Dalton.*) That is at the present moment?—Yes, the county assessment and the union assessment nearly coincide.

17,725. Has it gone down since 1873 or up?—That is a curious thing; in spite of the reduction of the value of the land, and although we have not a single manufacturing village in the union the assessment has been kept up, and in this way: I insisted upon the London and North-Western being assessed at its full value, and we had a very serious tussle with them. We went before the quarter sessions, and it took three

Mr. A. Pell. 20 Apr. 1894.

days to decide the case, but we held our own, and we got a large increase of rates. We never should have been able to do it if we had not been able to prove to the court that every other hereditament in our union was assessed at its value. Therefore we insisted upon the railway being assessed at its full value. Then the borough of Northampton formed a reservoir in our union for supplying Northampton with water, and their mains go for a considerable distance through our union. We are now proceeding to assess that at its full value. We are obliged to call in competent valuers, but it has helped us very materially, and we are now proceeding to deal with the telephone.

17,726. (*Chairman.*) It is rather peculiar in your union your getting this assistance, is it not?—I think in the Union of Ely the Great Eastern Railway Company's assessment was raised 22,000*l.* I am not quite sure about the figures, but it was a very large increase, and so relieving agricultural land. The maintenance of the assessment in our union in Northamptonshire has been through this assessment of the railroads and waterworks.

17,727. Do you think that the rate for the maintenance of the highways presses harder upon the agricultural interest than it should do?—I think it does. I always was against the removing of tolls myself; they are very disagreeable on a wet night if you are fumbling about in your pocket for *6d.*, but still that was a great deal pleasanter than the increased charge put upon one's land. I think that we suffer there. It is a very difficult thing to say whether a good road is made for the sake of the brewer, we will say, in Northampton, or for the sake of ourselves for our getting our beer, but I think that the land has got the worst of it.

17,728. The agricultural interest have used it less and have to pay upon a higher value?—Yes.

Cattle disease.

17,729. Now, turn to another subject. As regards the diseases of cattle, did you suffer from that in times gone by in your district?—We have suffered a good deal. We have suffered of course from the old rinderpest, and then we have gone through the usual course with the pleuro-pneumonia, and we have suffered very much from foot-and-mouth disease, and I am sorry to say that we are dreadfully afraid of anthrax, which has got close to my farm, and it has become a serious calamity. What the farmers feel and what I feel with them is that there should be great hesitation before foreign cattle are admitted from any country where there is a suspicion of foot-and-mouth disease or pleuro-pneumonia.

17,730. And in these times of very low prices of stock it would be felt still harder?—It would be fatal to us.

17,731. Do you think there is any difficulty in obtaining store stock?—I do not, but then I am a breeder.

Labour.

17,732. Now as to labour, what do you say with regard to the agricultural labourer of the present day?—Well, I think we are just in this position, that a few years ago there were always a number of men what you call hanging about, and they were very useful to us when we had occasional work to do, such as threshing and draining in winter. Now there is hardly any of that sort of labour to be picked up; we are obliged to rely upon the regular hands of the farm.

17,733. Do you think that the young men, sons of agricultural labourers, do not bring themselves up to farm work as they used to do, but go into towns and get away from home?—They do undoubtedly; they are very anxious to get into the police; and in Cambridgeshire we find they are anxious to go into the east of London to work with Pickford's vans, quite young fellows; that seems to be their desire.

17,734. Do you think that the farmer will suffer from the want of workmen, rather, skilled workmen, such as hedgers and thatchers?—I think that he has suffered lately, but I fancy that they are bringing up some of the young hands to this work, at least, I have myself several young fellows that are being trained to it.

Bad seasons.

17,735. Do you consider that the seasons have affected the crops very much since 1879?—Very much indeed. I do not think we have had a really good year, unless it was 1884. There has always been something in the seasons that has gone against one very much, either from wet or drought Last year it was a splendid year to live in, but it was a bad year to farm in, we were very much pressed indeed by the drought.

17,736. As regards railway rates, have you anything to say as to that; you sell milk?—I must say that I have nothing to complain of. I hardly see how one can suggest a complaint in this way. I am not a large consignor of stuff over rails, but I send my cattle over them, and if the railway rate was excessive I should drive the cattle. I cannot think that the rate for carrying a gallon of milk 74 miles by an express train for 1*d.* is an excessive rate.

Mr. A. Pell. 20 Apr. 1894. Railway rates.

17,737. Over how many miles is it?—74 miles from where I live. I wished the railroads would do something about delivery, and when I was in Parliament I pressed it upon Mr. Allport and some of the other managers of the railroads to do something in the way of delivery of the milk, so as not to leave it in the hands of the milk contractor. A farmer cannot sell a churn of 10 or 12 gallons of milk without passing it through a contractor's hands. He contracts with the man who carries the milk from the railway station to the dairies. If the railroad companies would organise a scheme for delivering the milk not in small quantities, but in quantities of not less than 20 gallons in the cans to the dairies in London, I think that the farmers would have a better chance.

17,738. The contractor is really a middleman between the farmer and the dairy?—Yes; and then the dairy stands between the kitchen where the milk is consumed and the contractor. I might say that when I spoke to Mr. Allport about delivery to customers some years ago, he said that it could not be done. I said, "Now Mr. Allport," he was not then Sir James Allport, "if "the London and North-Western do it do you think "you could not find out some way of doing it?" and he said, "Of course, we should have to do it directly."

17,739. Would that apply to cattle or sheep alive or mutton or beef dead?—Fresh meat is delivered in small quantities in an extraordinarily rapid way. The rate for fresh meat or poultry from where I live to London is half of three-farthings a pound only, and this is delivered within a very short time from leaving the farm to the kitchen in London.

Tenure.

17,740. As regards the tenure of land do you wish to say anything about that?—I hardly know whether you use tenure in the sense of ownership of land or of occupation of land.

17,741. I meant the occupation of land. Have you heard any complaints of that?—No, I do not think we do now. A few years ago there was a universal complaint that people could not take leases; now one hears nothing at all about leases. Some years ago, when the Agricultural Holdings Act was discussed in the House, a longer notice was demanded for quitting, but now people are glad to get out at a very short notice. I do not think that there is anything to be said against the tenure of land; it is just what the owner of the land and the tenant like to make it. I have some in Leicestershire upon a tenure of never more than 12 months, the agreement only requires 12 months' notice. It is a printed agreement and I have no trouble. I say, "If you like to give it up at the end of 12 months "you can, but if you will stop on the land, then you "can come and sign another agreement."

Restrictions.

17,742. As regards the restrictions as to the cropping of land have you anything to say to us?—I think they are very necessary. I do not think that they can be done without for this reason, I do not think you can, except with danger and disadvantage, depart from some approved and accepted cropping of land. I think people get into difficulties when they do. I am not talking of land near London, for instance, where the custom is to carry a load of hay and bring back a load of horse manure. But take land in Cambridgeshire. I observe now an enormous quantity of straw that is going out of the county. There are these threshing machines packing up the straw, and nothing will make me believe that the land will not suffer, and it will be found out in a few years time.

17,743. You thought that there was some restriction upon the cropping of the farm?—No; if I were to let my land I would impose exactly the same restrictions that I impose upon myself. I do not think that I have sold a ton of straw myself off my own land, I am sure I have not.

The Agricultural Holdings Act.

17,744. Have you heard any complaints as regards the Agricultural Holdings Act?—Yes. I have heard a great deal of talk about the Agricultural Holdings Act. I had a great deal to do with the first Act when it was passed. It was supposed to be a panacea for all the

Mr. A. Pell.
20 Apr. 1894.

evils of agriculture, and then the amending Act of 1883 was considered further to meet the difficulties. I think the Acts have done good. I think that they have enabled farmers to put artificial manures upon the land, with a certainty of getting their money back. On the other hand I view with great suspicion the valuations that are connected with all these stipulations for improvement. My own experience leads me to distrust excessively the work of valuers. There is no work in England that I distrust so much as valuations. Valuation. In a very large degree they are conducted by incapable people and people who go upon no principle. For my own part I do not think that any improvement should be valued which is not visible. If a horse is said to be improved you see it at once; he is stronger, sleeker, and heavier, and you price him on actual view of these conditions; you do not buy him upon an estimate of how much corn the stablemen gave him, and how much cramming he had. So with the land. When you have the mere statement that the land has had so much superphosphate and sulphate put upon it and so much cake eaten upon it, you cannot tell what the cake is like or what the quality is. If in the face of all that, the production is smaller, and the farmer keeps less stock, in the last 10 years we will say, in spite of all the improvements that he can produce upon paper, I say that the improvement is worth nothing, and that is the opinion held by Sir John Lawes. I believe there was a famous case tried in the Irish Courts—I know the Duke of Leinster was on one side in which Sir John Bennet Lawes was called as a witness, and he held very strongly to the opinion that I am stating now, that improvements to be valued should be visible improvements, that there should be something to show for them. Therefore my own feeling is that upon a man going into a farm he should have a most accurate and elaborate statement of the condition of every part of the farm—every gate, whether it is made of oak or deal, how the hooks and hinges are, every gap in every hedge, and the condition of the ditches, and a statement of the land how many sheep per acre it has been feeding, how many beasts—all that ought to be scheduled, and the tenant before taking the farm ought to accept that schedule as an accurate statement of the condition of the farm on entry.

17,745. Who should take this inventory?—It should be made by a capable man, just as you let a house.

17,746. Should he be the landlord's valuer?—The landlord's valuer, and the tenant might bring in his own valuer. He probably would have to see that the statement is a correct one, but it would be a statement of facts and not a conjecture; there would be no conjecture in it at all; there would be no statement as to what had been done to the land, but it would be a statement as to the absolute condition of the land and of the premises; of the condition that it is in at the time when the tenant proffers for the farm, and a statement of what the productive power of the farm has been for a series of years, or during the last three or four years, because it may be 40 years since there has been a change of tenancy. When the tenant goes out——

17,747. Say at the end of 20 years?—Yes, if the gates are found to have no hinges; if the ditches are filled and the hedges out of order; if the sheep kept on the farm are only 80 or 90 per cent. of the number that used to be kept, and the cattle in the same proportion; if the outgoer shows that he has been only selling three quarters per acre instead of four quarters; whatever statements are made as to the use of artificial manures and as to acts of cultivation, there is no improvement. I would like to observe this, that if you let a house a most accurate account is taken of the condition of every room, every crack in the window, every hinge, every door lock; they are all stated, although it is a trumpery affair of only 100*l.*, but when you come to let a farm for a period of years with a rent of 200*l.* or 400*l.* there is nothing of that sort of detail that I am aware of ever put down upon paper.

Tenant's capital. 17,748. Do you think agriculture has suffered from deficiency of capital?—No, I do not. I think that a great many owners and tenants, too, have suffered by sinking too much capital. One of the secrets of successful farming is not to have a farthing more than you can carry on the business with, and the capital is not a very large one that is required for farming now. The capital engaged in farming in England is exactly what the English farmer would sell up for now. If you sold them up now it would not be more that 6*l.* per acre, except to men who had just bought their grazing cattle, and those I estimate at from 20*l.* to 25*l.* per acre.

Mr. A. Pell.
20 Apr. 1894.

17,749. You are aware that a good deal of capital has been lost by farmers, are you not?—An immense capital. I have lost plenty myself.

17,750. But to go into a farm now would not require the capital that it did 20 years ago?—No, it would be undoubtedly less, because his live and dead stock would cost him less.

17,751. Even now, I suppose, you would not like to take anybody as a tenant who had no capital?—No, I would like a man to have capital, and I should like to see the accounts of the farm that he had been holding before deciding whether I should have him or not. I should like to know whether his accounts show that he had been making a mess of his business.

17,752. You would think, then, I suppose, that for many reasons the farmers should keep accounts?—Undoubtedly—the same sort of accounts as are kept by a trader.

Increase of occupying owners. 17,753. Have you any remedies to suggest for the depression?—Well, one remedy is, that I think I should like to see the land more occupied by the owner. I think there must always be a difficulty in the antagonism—the natural antagonism—that must exist between a tenant on a farm and an owner. The tenant, let him be ever so good a man, must be desirous of taking as much as he can—of converting as much as he can of the tillage of the land into money, and he naturally would not think of what is to happen 20 years hence. Again, with all the local work already, a tenant would not, naturally, go in for the maintenance of the roads in such a high state, or the making of a new road in such a high state as an individual owner would. I cannot conceive that land could ever be so thoroughly well managed under a system of landlord and tenant as it would be if the owners of land were to cultivate it themselves.

17,754. You think that they ought to have a practical education upon the farm?—Yes, I do. I do not see how they could succeed without that.

17,755. Would you wish to see the very large estates broken up into smaller ones?—I would do nothing either to encourage the enlargement of estates, nothing by way of legislation, or to encourage the breaking of them up. I do not see any impossibility with a man of 20,000 acres of land if he had capital farming it—I think he can do it as easily as 2,000 acres.

Technical instruction. 17,756. As regards the education of the tenant farmer, would you wish to see that altered in any way?—No. I wish to see the tenant farmer stick to his father or his farming companions if they are good men and attend the markets regularly, having a liberal mind, and not a bigoted goose who would say that scientific men can do nothing for him. You want a man who would be capable of appreciating any new discovery that is likely to come about in his business, and especially, I should think, you want a good accountant.

Sale by live weight. 17,757. Do you think that any improvement is possible in the system of marketing produce—you have told us, as regards milk in the large towns, but in other ways is improvement possible; would you, for instance, advocate the weighing machine?—I would, very much indeed.

17,758. For both store cattle and fat cattle?—For both store cattle and fat cattle. It has become very general in Scotland, and the Scotch are people who are pretty well able to understand what is the best way of doing business.

17,759. Generally speaking, the tenant farmer would profit by that?—I think very much, because under the present custom no doubt the butcher or the salesman has him at an advantage though I do not believe either the butcher or the salesman can put the weight accurately upon a single beast; if they get 10 or 12 in a yard they can come very close. Then whenever they have tried by guess or by hand—by feeling—and the animal has been brought to the test of weighing, in most cases their judgment has been found to be very wide of the mark.

Co-operation. 17,760. Have you had any experience of farmers combining together to sell their own produce and stock in large towns?—Yes. At one time I had that experience myself with Lord Wantage, and one or two others. We formed a small company, a sort of private

Mr. A. Pell.
20 Apr. 1894.

company, with the purpose of working our stock off, and anybody else's who cared to consign to us.

17,761. Did it answer?—No, it did not answer; we came out with a loss, for we found, among other matters, you could not get on without the bribing of servants.

17,762. From the retail shop, do you mean?—It was necessary to bribe managers, and for an eating-house or private house you must pay a bribe. I have been told by a gentleman who has been examined before this Commission that a butcher, not very far away from where we are now, told him that he paid no less than 2,000*l.* a year to servants for "palm money."

The marking of foreign meat.

17,763. As regards the sale of foreign meat, would you put any restriction on that in the way of people taking out licenses and stating that they sell foreign meat?—I should be entirely against anything of the sort. If a person cannot tell foreign meat, if it is as good for him as English meat, I would not interfere in any way. First of all, I think it is impracticable in its working to brand a chop like Jewish flesh.

17,764. I did not ask that. I only wish to know whether you think that they should state that they are selling foreign meat or take out a license for it?—No, I do not. I would leave that alone. It would encourage a great deal of lying and deception—more than the thing is worth.

State loans.

17,765. Have you anything to say to State loans being granted for the purpose of agriculture?—Yes. I should be very sorry to see that encouraged.

17,766. In any way?—I should myself in England. "Come lightly and go lightly." I think that the landlords have suffered enormously from the facilities of borrowing money through these loan companies—termed Improvement Companies. Though they are nothing more nor less than money lending companies with powers acquired by their special Act of granting a first charge upon land. Immediately in their train came a number of surveyors and so-called engineers who were the advisers of the unfortunate landlord, and, among other mischief, caused him to bury tiles at a great depth in dense clay.

17,767. You think that it ought to be left to the owner or occupier to find his own capital?—I think so.

Wheat-growing in America.

17,768. We all know that you went to America for the Duke of Richmond's Commission; have you anything to say upon that subject?—No, except this. I think Mr. Read and myself in our Report have been misinterpreted. The common statement is that we said wheat would not be brought over here under so much a quarter—42*s.* I think it was. What we really said, and gave the figures for, was that it could not be grown and delivered here at a profit under that sum. I think experience shows that we were wrong in the amount; I think that we should have stated something less; but I am perfectly clear of this, that the American is losing quite as heavily as the English farmer, and perhaps a little more heavily. He is growing wheat at a loss, and it has been often said to me, "Oh, "but that is a really ridiculous statement, do you "think that an American would grow wheat at a "loss?" I know that the English go on doing it at a loss and, therefore, you may reason that the American will do it upon hope and also upon borrowed money—from English capitalists.

Poultry farming.

17,769. (*Mr. Whitehead.*) You say that the prices of the best qualities of poultry, for instance, ducks, have not gone down in the same proportion as others?—I think so.

17,770. Does that mean that the producer gets the same amount as he used?—Not the same amount, but there has been a less abatement, a less drop in the prices which he does get, as compared with present prices for inferior food.

Co-operation.

17,771. And you say that you have tried by promoting a co-operative society to bring the consumer and the producer together?—We tried that.

17,772. That has failed?—That did not answer.

17,773. Does that apply to large co-operative societies that have been started on the same idea?—Distributive co-operation has paid very well, and even with farm produce—take, for instance, the Army and Navy Stores—there, I believe, they get money out of their sales of farm produce, but this was for the distribution of produce from the place where it was produced among the purchasers.

Mr. A. Pell.
20 Apr. 1894.

17,774. (*Mr. Giffen.*) You attribute, I understand, the chief cause of the low prices and the depression in agriculture to foreign competition, which has become more effective of late years?—At the present moment.

Foreign competition.

17,775. Have you formed any opinion as to whether that competition has reached its most severe extremity or not?—No. I do hope that in America, both the land and the people who cultivate it would get tired of sending this quantity over, but then there are new fields, there are the Argentine States and New Zealand and Australia. The United States has really, I believe, a less area of ground cultivated for wheat than it had.

17,776. But you have not entered into a general discussion yourself as to whether the prices of agriculture generally, are likely to improve now, competition having done its worst?—I do not believe that the opinion of any man alive is worth having. It is impossible to form any reasonable conjecture, and I am quite prepared to see things get worse and lower.

17,777. Apart from conjecture would it not be possible to have some estimates, for instance, whether there is any additional area in New Zealand likely to be used for sending carcases of mutton to this country?—Yes, it might be of interest from an academic point of view. I do not think it would at all influence the sheepowners here as to whether they would breed more or less sheep, I do not think it would be of any service.

17,778. Not that particular fact alone, but facts of a similar kind. Has no one been making a study of the subject with a view to estimating as to what prices are likely to come to in the future?—Practically I think it would be of no service. You cannot produce either meat or grain on a farm as you can produce a pin in the course of an hour. The production of farm produce takes a year or two. If you want a sheep you have to get the land in order and the ewe impregnated, and the farmers would be extremely unwise to alter their hand on the mere statement that there is likely to be new or fewer fields opened abroad for the sending of produce to England.

17,779. Still it must be a question of price for the people abroad themselves to enter into the competition?—I think so.

17,780. (*Mr. Clay.*) Are you of opinion that the increase will go on in the dead mutton trade from those countries that Mr. Giffen was referring to?—I do not think that my opinion would be worth giving upon the subject; judging from what has happened in Europe one would imagine there must be a cessation. I think England has proved herself capable of eating out all Europe in her meat and her grain too. I recollect when the German cattle came over and everybody was terrified at the sight of them. The animals were I do not know how old, seven or eight years, and soon, in two or three years we bought them out. Although we have very good appetites, it will be a very long time before we shall eat out the west of America.

17,781. (*Mr. Giffen.*) I suppose the consumption of meat on the Continent of late years has rather increased than diminished, has it not?—I should think so. I have travelled very little upon the Continent, but from what I read I should say the people are living better, and, of course, in America the consumption is very great; but I have been several times in America, and I have seen the American artizan who has been unable to put a bit of meat on his table in Cleveland, at a time when we thought they were all living in the utmost state of prosperity.

Trade and agriculture.

17,782. (*Mr. Clay.*) To return to the remedies for this depression, I suppose you would say that an increased prosperity in our trade would largely benefit all classes?—Prosperity in the English trade would generally, do you mean?

17,783. Yes?—Undoubtedly; the more money the artizan has he is very ready to spend it in good meat.

Reduction of rent.

17,784. As far as the tenant farmer is concerned, a still further reduction of rent would improve his financial position, would it not?—I think it would. If I was a tenant farmer I would go very strongly in for that, and I think I should be justified in doing it.

17,785. As far as he is concerned that is the just advantage that he can receive?—Not only is it his just advantage, but it is his last resource. It is very much the practice in some districts for the farmer to farm the landlord and not the land. When a man feels that he ought to get 50*l.* to run his business, there are two

Mr. A. Pell. 20 Apr. 1894.

ways of getting his 50*l.*; he may, perhaps, think that with increased energy applied to his work it might bring him in 50*l.*, or he may go round to his unhappy landlord and get 50*l.* reduction in the rent. There are two methods of getting his books right.

17,786. Referring to that remark of yours, you consider that if a farmer has not a profit on his farm he naturally draws in his expenses on the farm service?—Yes, he would not spend so much upon the land.

The Agricultural Holdings Act. Valuations.

17,787. Regarding the Agricultural Holdings Act, you say that you have a great distrust in the valuations that have been made?—I have a very great distrust of them in England.

17,788. But what remedy would you suggest?—To keep away from them as much as you can—have as little to do with them as you can.

17,789. But if you are forced into the position, what then?—There are a few men, one or two in England that perhaps I may go to with some hope that the thing would be done in a business like way, but on the whole the system of valuing in England is most unsatisfactory. In the first Agricultural Holdings Act I got a most important clause put in, that no award should be a valid award which did not set out in the award the detail of every item that was valued. Now that is not observed. I know of one large valuation made in Northamptonshire in which it was supposed that the landlord was very much wronged, and I asked his agent how the valuation had been made, and he said that it had been made on a lump sum, and I said, "How can you complain—look at the Act."

17,790. It has been suggested here several times that in each county there should be, according to the size of the county two or three, or four, or five official referees appointed, and they would become naturally experts in the business, and all the valuers in different districts of the county would be referred to them, what do you say to that?—There is no referee better than a court of law with a barrister to examine and cross-examine, if you want to thresh out a disputed case.

17,791. You will admit that the general failure of the Act has been through its cumbrous procedure and its excessive expense. Now the method that you advocate of going to law would stop both landlord and tenant from having their case settled for fear of the extreme expense?—I do not know that in the end it would be more expensive. If you pay 100*l.* under the system of valuation for a thing worth 20*l.*, perhaps you had better let the lawyers have some of the money.

17,792. Could not you have official experts in that special business?—Yes, I fall back again on the statement I made in my examination in chief that after all the proof of improvements must be visible, and then I do not think you want such very expensive referees.

17,793. You talk about improvements being visible?—Yes.

Payment of compensation.

17,794. The allowance for compensation is not extended over one or two years from the end of the lease?—With regard to the artificials, do you mean?

17,795. The artificials, the cake feeding?—A few years more it runs back for lime.

17,796. Take artificials, and cake feeding, and manures, the last two years and some of the last year, where do you see anything visible in the last years of the use of cake?—I should want to know the visible improvement, and what I referred to was not the appearance of the crops being made to grow by any artificial means, but I should look at the books of the farm, and see that the produce of the farm had been increased, and that it had been increased by this course of improvement; that the land would produce more grain, more heavy produce.

17,797. But if it can be shown that the improving tenant going out had been keeping more stock, and producing a greater weight of turnips or grain, and selling off more wool, I should say that man had effected improvements upon the land, and such improvements as he might be fairly compensated for. That statement of yours would be correct if the valuators under the Act could be allowed to go back and give compensation for increased fertility?—If the increased fertility resulted in a better balance sheet; if the increased fertility to improvements was wholly proved and represented by the man being able to show that off that land he had been selling more saleable agricultural produce, I should say that was a proof of fertility; and that matter should be ascertained not by looking at the land, or smelling it, or by looking at any papers that he could produce about having bought artificials.

Mr. A. Pell. 20 Apr. 1894.

17,798. But the Agricultural Holdings Act never faced that increased fertility in laying down old grass and keeping more stock?—There you have touched upon a point where you could not prove fertility, but where the tenant ought to be compensated, because we know that there would not be, for the first year or two, any increased produce or profit from the laying down to grass, but at the same time it would be a material improvement to the holding.

17,799. That is what I wanted to be at?—Undoubtedly, then I do not think that he wants a very skilled valuator or official referee. If the land is clean, and there has been a good planting of seed, and it is fairly good grass that is all you want to know. If he has put lime into it he would receive compensation for lime under the Agricultural Holdings Act, running back seven years, I think.

17,800. Do you think that the seven years would exhaust the lime?—There was an old saying when I was young that lime would buy the horse, while chalk would only buy the saddle; that permanent improvement was effected by chalk, and not by lime, that the endurance of the improvement was much longer in the case of the chalk than in the case of lime, which was a very common saying when I was young, in the districts north of London, where both chalk and lime is used; I am quite aware that the lime has a longer effect than superphosphates or manures of that sort. I have used lime in Northamptonshire, and I think seven years was a very fair allowance myself. Now, of course, it is not so much used in England on account of the cost of carrying it the cost of bringing it away from the lime-kiln. I used to have to send six miles for it. You produce an effect by these more powerful superphosphates which do not cost so much in carriage.

17,801. Going back to the question of the fertility of the soil under the Agricultural Holdings Act have you heard of that case of Corshope? The tenant had used an enormous quantity of cake on the land, which was moor-land, and he had more than doubled the quantity of stock on the farm, and on leaving he got a mere pittance of compensation for going out?—I am not aware of that case. I am aware of what lime has done in Scotland, and I am also aware of how some of the landlords in Scotland and the north of England have really suffered by improving their land with lime; that is to say, that the cost was greater than the return from the land. For instance, very good grouse-land, which before being touched would probably make half-a-crown an acre for grouse, but having had a large sum of money spent upon it in cultivation, liming, and seeding, has been found not to answer, and it is running back again to its wild state.

17,802. But when land has been proved to carry double the quantity of stock, and that the fertility of the soil has been increased by cakes and boning, why should not the farmer have to pay for that increased fertility?—Undoubtedly, in that case you have the visible improvement that I have been talking of in the greater number of stock maintained upon the land, and that is just the reason for claiming compensation for improvement. But if the improvement was not accompanied by any proof of the producing powers of the hereditament being increased, then I say that the improvement is nil and visionary.

17,803. If they cannot carry more stock, of course there would be no compensation?—I do not think there ought to be.

17,804. But if I can carry more stock, I need not refer to books?—That is a fair ground for a claim for compensation when a tenant is going out—a very fair ground. I am supposing of course that a man has not brought on to the farm a quantity of stock; that he has not been playing the trick of keeping a quantity with artificial keep for just one year in order to get more out of the landlord—I am supposing that the produce has been fairly increased by the man's farming operations.

17,805. I am putting the question to you knowing that he has during half the lease, nearly the whole of the lease, increased the fertility by that mode; then you would allow him compensation?—Yes, I should; I should be glad to have such a tenant.

17,806. He improved the farm about 300*l.* a year, and got at the rate of 10*l.* for it?—Just so.

Dairying.

17,807. (*Mr. Gilmour.*) You do not think that there is much encouragement for an increase in dairy farming?—I did not say that.

17,808. You spoke about the fall in the price of milk?—Yes.

17,809. To what do you attribute that?—It is attributable to so many farmers having gone into the business. They get ready money every fortnight, and it is always bringing something in to the farmer.

17,810. And even at that reduction, have those men who have gone into the trade bettered their condition by doing so?—Yes, I think many men have been kept going by having a good opportunity of selling their milk.

17,811. And are they keeping up the quality of the land by turning it into this dairy work?—Yes, I do not see that the land suffers. It is said that land suffers from extreme milking and that it requires a supply of bone. That may or may not be the case; in fact I know that it is the case with regard to cheese making; the land could not go on making cheese unless you boned it.

The making of land.

17,812. (*Mr. Little.*) You wrote an article a few years ago, in the Royal Agricultural Society's Journal, on "The Making of the Land in England," in 1887?—Yes, about that time.

17,813. And shortly, I may put it, you came to the conclusion that on a great deal of land the present value was almost entirely produced by the capital expended?—Entirely; I should say, take England all over, generally speaking the land itself is worth nothing. If you were to sell the greater part of the land in England it would not bring back to the owners of the land the money that has been spent upon it in making the land; that is to say, in a measure, not in cultivating, but in merely making it from the wild state, and ready with enclosure for farming.

17,814. If that was true in 1887 it is still more true now?—It would be.

17,815. You give one instance where if the money had been invested and the land let at 1*s.* per acre the landlord would get as much as he gets now?—I took certain instances; Mr. Heathcote's (an old friend of mine in Huntingdonshire), and Lord Leicester's, and Lord Bathurst's, and one other property, the owner of which did not wish to have his name mentioned. With regard to the statement I made as to Mr. Heathcote's, Lord Leicester's, and Lord Bathurst's, they were all reviewed by the owners of the property, and the matter was put into print, and it was accepted by them as a fair statement of what had been done. With regard to Mr. Heathcote's property the capital expended on his property in his lifetime, and the lifetime of his father, was 218,000*l.*, and it was not a large property, and the rental is less now than it was before the improvements began. In Lord Leicester's case I left out one particular farm which had been rather an experimental one, and I found the expenditure was over one million, and the net income of the estate fell from 30,000*l.* a year to 27,000*l.* a year.

17,816. And it is now still lower probably?—It is still lower probably. I think it was shown in Lord Leicester's case that if he had never spent a penny he would have been richer, and if he had invested what he and his father had spent upon that property at the rate of 3½ per cent. he would have had an income of 36,000*l.* a year, and the land besides, whatever it might be worth, in its unimproved condition.

The fen country.

17,817. The statement is emphatically true of the fen country, which you know?—Certainly in the fen country we have the enormous advantage of that splendid land when we got the water out.

17,818. But the annual cost, besides the original outlay, is very considerable, is it not?—Yes, in my own case I think we pay 4*s.* 6*d.* an acre for pumping always, a great deal of money has to be spent in their keeping the land in a cultivateable condition. The drainage tax, I see, upon 418 acres in Wilburton parish is 4*s.* an acre merely for throwing out the water, dykes, and pumping.

17,819. But in some districts it is 14*s.* or 15*s.* an acre?—Yes. In another fen where I have got property it is more than 4*s.*, but that is including the roads. That was enclosed under a private Act of Parliament, and we throw the whole of the rates upon the owner; the tenants pay no rates. When the Act was obtained we thought that it would be better to leave roads to the owners, and the result was that we got splendid roads made, and maintain them as such.

17,820. Although the rents of the fen country have kept up pretty well the land has suffered, because those rates are taxes, are deductions from the gross rent?—The rent in the fen land was kept up very well until two years ago, and since then the drop has been fearfully measured by what I get off the land myself, which is the rent. I did fairly well up to two years ago; then the books were made up to Michaelmas, now they are made up to Christmas, and there was a most fearful fall in rent, owing to the very bad harvest of 1892 and the very low price of cattle as well as of grain in 1893.

17,821. (*Chairman.*) You did well before that?—Yes, I had no cause to complain whatever.

Rates and administration of the poor law.

17,822. (*Mr. Little.*) Then you charged yourself the whole rent?—I did, and I am obliged to knock it down, but I hope for improvement.

17,823. With regard to local rates and administration, I should like to ask you a question. You live near Brixworth, and the effect of your administration has been to reduce pauperism?—Yes, I could give the figures.

17,824. That is the effect of your own evidence?—Yes, it is quite marvellous. At the present moment I think we have 18 outdoor paupers and I think about 70 indoor. It is nothing, it is a mere nothing. I have got the numbers.

17,825. (*Chairman.*) Have you got the numbers as compared with what they were?—I will give you them exactly. Now, going back to 1873, we will take one day in the year instead of the total number of paupers for the year, because it is as good a measure as you can have; they are all taken from official returns. There were in 1873, on the 1st of January, 572 persons receiving ordinary relief and 26 persons receiving medical relief only. That made 598 persons having outdoor relief. In the house there were 60 persons, and the total number of the indoor and outdoor paupers was 658. That shows that one person in 21 of the population was a pauper, including peers, parsons, squires, fox hunters, the medical profession, lawyers, and everybody. On the 1st of July 1893 there were 20 persons in the receipt of ordinary outdoor relief; there was not one person receiving medical relief only; and the indoor paupers had risen to 72. The total number of paupers in the union, in and out, excluding the lunatics, was 92, and the proportion of paupers to the population was one person in 132, instead of one person in 21.

17,826. (*Mr. Little.*) And that has been accomplished by a strict administration of the Poor Law?—By a most unwearying attention to that subject on the part of a few individuals.

17,827. Has that been accompanied by any hardship to the poor?—It has not been shown. I do not think that it can be shown in the case at all. One proof of the prosperity of the people is—I know the same proof is to be felt elsewhere—there is no woman to be seen working in the fields, and this shows that the head of the family is maintaining himself and his children.

17,828. That point as to whether the system of relief has resulted in hardship has been investigated from time to time by a clergyman, the Rev. W. Bury, in your district, has it not?—We have never been left alone by gentlemen outside who have nothing to do with us; there have been commissioners, inspectors without end from the Local Government Board to inquire into the condition of the union, as to whether injustice has been done, and what the state of the health of the people is.

17,829. Has it led to depopulation of the district?—There has been a drop, but it has not been very marked, I think. It has not been more marked than elsewhere in the rural districts in England. I think it has dropped from 13,000 something to 12,000 odd. The population now is 12,186, and I think that under the old census it was 13,000 and something.

17,830. You think that considerable relief from the rates might be obtained by a better administration of the Poor Law?—I am quite sure of it; the most material source of relief in the rural districts would be better administration under the law as we have it.

Assessment to rates.

17,831. At the same time you would think that land should not be rated for many of the purposes which it has to maintain at present?—It should not.

Mr. A. Pell.
20 Apr. 1894.

17,832. Would you approve of the extension of the system adopted in urban districts under which land is rated one-fourth, or above one-fourth of the rate for certain purposes?—I was not aware of that, and I was a guardian for 18 years in London.

17,833. In urban districts for certain purposes?—I am quite aware of that.

17,834. Would you be in favour of an extension of that system for certain purposes?—I certainly should. I got that differential assessment into the Public Health Act, 1875, and some other Acts, myself, when I was in the House.

Rental of Guy's Hospital estates.

17,835. Do you think it would be fair to charge the expense which will be incurred by the Parish Councils on that principle?—I should not like to give an answer without considering it further. Would the Commission allow me? I have here a statement of rental, as well as the old rental, of the estates of Guy's Hospital, and it is very remarkable, the drop in the value of the land. In 1875 the gross value of the country estates was 41,840*l.*, and the net value was returned at near 31,000*l.* In 1891 that had dropped to 27,550*l.* gross, and only 17,220*l.* net.

Payment of compensation.

17,836. With regard to compensation for improvements, you are in favour, as far as possible, of confining that compensation to visible and tangible results?—Yes, I am in favour of all valuations, when the umpire or the valuers between them are coming to a conclusion, being tested by fact; it would be this: Is this land better for all these improvements? And the proof of the betterment by a tenant's improvements is to be, has it been giving for the last years of the tenancy of the man going out a better return and profit?

17,837. You will remember Sir John Lawes's argument that if a man grew half a ton per acre more straw than he grew when he went in to the farm he must have improved it?—I should look upon that as a ground for compensation, but not if he put in 50 tons of artificial manure merely.

17,838. Would that not be an argument for paying a market price for the increased produce if the incoming tenant or landlord buys the produce?—Do you mean that the landlord should have to buy the increased produce at an amount put upon it by the valuer?

17,839. When a farmer quits, if he has improved the land so that he grows half a ton of straw more per acre than it did upon an average of years before, you say that he is entitled to compensation?—Not for the straw.

17,840. For the increased fertility as evidenced by the straw?—The straw among other things.

17,841. The straw is an evidence, I am taking it as one item?—I might take the grain at a higher figure.

17,842. Take anything you please, on what principle then would you compensate, would you buy that of the man; would you buy the increased produce?—No, I should not buy it of him; but at the present moment when a man comes out of the farm, the valuer says, This man has put so much superphosphates, and lime, and so much cake, and therefore he is entitled to a certain proportion of the expenditure upon this farm, and that is to be paid as compensation, I should say to this man in the same way, the improvement of the fertility of the land would be measured by the actual produce.

17,843. If it is to be measured by the produce it must be in proportion to the produce?—Certainly.

17,844. And therefore it is, in effect, by buying the produce?—By the improved rent.

17,845. Of course, you are aware that that produce would vary in consequence of the seasons, and that a season like last year would be disastrous?—If it was valued upon the straw.

17,846. If it was valued upon anything?—Not upon grain.

17,847. Yes, upon grain on many farms?—Not in the fens.

17,848. Not oats?—I had a very fair yield of oats, and a splendid one of wheat—the whole yield of wheat averaged 5½ quarters.

17,849. Is not the main argument in favour of paying for recent consumption of cake and using manure the inducement to the farmer to continue good cultivation to the end of his tenancy?—I think that it is.

17,850. Is not that a reason for paying for the last year's consumption, at any rate?—Yes, I think it is.

Mr. A. Pell.
20 Apr. 1894.

17,851 For money judiciously expended in the ordinary course of farming, it is a perfectly legitimate subject for compensation?—I would rather, instead of saying "judiciously expended," substitute the word "profitably" expended, I would pay him for the expenditure that he has made on those articles, but not unless proof of the value of this expenditure could be given.

Uncultivated land.

17,852. (*Mr. Chaplin.*) You told us about land that had become derelict, and about some that had tumbled down to grass and made a very small rent; is that land that you referred to within the counties you mentioned as those with which you are particularly connected?—Yes, some of it is in Northamptonshire. It has not become derelict, but has, just as I expressed it, tumbled down to grass. It is being left to grow its natural grass.

17,853. The land that has become derelict, where is it?—That is in Essex, and some is in the North, I cannot tell you exactly where, but it is between Retford and Doncaster. It comes down to the right side of the Great Northern Railway.

17,854. You are not aware, then, of any land in that condition in Cambridgeshire and Leicestershire?—I am not sure that there is not some in Cambridgeshire. I think there are considerable tracts on the North-western branch from Bletchley to Cambridge which have some grass on the land, and a lot of little bushes. I do not know whether it is rented, but undoubtedly it has been derelict.

17,855. Do you say there is a considerable breadth of it?—There is as much, I should think, as a hundred acres of it altogether.

17,856. I observed that, in reply to the inquiries we sent to some of the Inspectors of the Board of Agriculture, Cambridge is reported to have a good deal of land out of cultivation. Would your evidence bear that out?—I think as between Cambridge and Bedford it might, but I have not been driving through that county or stopping there. I only see it from the line of railway.

High farming.

17,857. You tell us that agriculturists who were business men had satisfied themselves that high farming is no remedy for low prices?—I think so.

17,858. I suppose that is because the product of high farming at present prices does not pay for the cost of producing it?—That is so. There is a certain point up to which you might spend capital in high farming with prudence, but when you go beyond that the produce of that high farming costs you more than it ought to do, and more than could be remunerative.

Quality of cultivation.

17,859. You say you do not think the cultivation of the present reduced amount of arable land has deteriorated either by want of working by certain crops or by insufficient manuring, but some part of that land, as I understand, has deteriorated?—That is the land which has been derelict, or is derelict, but taking England through I think I never saw evidences of better cultivation than are to be seen in England now, north of the Thames. I have not been down south.

17,860. You are speaking of the present season?—Yes, the present appearance of the face of the land, and last year and the year before I think the cultivation was very good.

17,861. Surely the season is much more favourable at present that it was last year?—Much more, but the cultivation was good last year. The men did the best they could, and I think the best that could be done under the circumstances, considering what a trying season it was upon the clays.

17,862. What I understand you to mean is this, that where the land is still cultivated, where it pays to try and produce, there it is still well done?—I think so, and better done now than it was five years ago. Men seemed to have settled into the saddle more steadily; although it is an uncomfortable saddle they are sitting the horse better.

17,863. You told us that the chief effect of the depression after all was to be seen in lower rent, and that the first thing a farmer naturally looked to was for further reductions of rent?—Yes.

17,864. It is the case, I think, is it not, that rents have been very largely reduced already?—Enormously.

Mr. A. Pell.
20 Apr. 1894.

17,865. I understand you hold it as your opinion in a great number of cases that rent at the present moment represents really nothing else but interest upon the outlay which has actually been paid by the owners of the land?—I am quite sure of that. The idea of land cultivated being national property is a most erroneous idea. Land as we have it now is just as much a manufactured article as the cloth in the coat that I am wearing.

Interest on landlord's outlay.

17,866. How far would you push that opinion? Would you say that the present rent represents or does not represent the ordinary interest that you might expect from invested capital?—On the whole it represents the poorest possible interest. In that little article that I wrote, upon which I have been asked some questions to-day, I show conclusively that one per cent. has not been made upon the expenditure, and the very able expenditure, by men whose names are notorious as improvers of land in England, who are not visionary men, but very capable men. Take Lord Leicester and Lord Bathurst, for example, and Lord Leicester's father was another example.

17,867. You say that you are quite sure in many cases it does not return now more than one per cent. interest. You do not mean to make that statement as affecting land generally throughout the country, but you make it, I apprehend, with regard to estates owned by people of the class of whom you have been speaking?—Typical estates, estates which were considered to have been examples for other landowners to follow and which have been repeatedly quoted as examples of what other landowners should do. Upon the whole, if you take the cultivated land of England, especially the arable portion, I question whether the owners are getting one per cent. for the improvements they have done or the expenditure they have made in order to bring the land to an ordinary productive state.

17,868. Would you go so far then as to say this, that taking the average agricultural land throughout the country at the present time the rent which is paid for it does not do more than represent an interest of one per cent. upon the outlay which has been made upon the land by owners generally?—I have not gone over so wide a field in England as your question contemplates, but, generally speaking, I think if you did go into the inquiry you would find that one per cent. would not be earned by the capital of this country in making the land lettable. I put it in that way—making it lettable—and I exclude from that capital all the capital which has been expended by tenants in cultivating the farms.

17,869. Yet although the rent represents so small a return upon the outlay which has been made upon the land at present by its owner, you are of opinion that in all probability things will get still worse in the future?—I am inclined to think myself that we may see worse times before we see better; so much so, that if I had a thousand pounds to spare—and we have not many thousands to spare now-a-days—I should be more inclined to put it into the North-Western or the Great Western Railway than into even acknowledged improvements of one's property. That is my own feeling which I have acted upon.

Fall in prices.

17,870. I think the general drift of your evidence comes to this, that the real cause of agricultural depression at present is the fall of prices?—Yes, there is no doubt of that.

17,871. There can be no effectual or permanent remedy without some improvements in prices?—I think there are other remedies besides the improvement in prices, but immediate relief would be given by improvement in prices.

The currency.

17,872. You stated that in your opinion the fall in prices was due entirely to foreign competition or due mainly to foreign competition. Have you ever considered the question of what effect certain alterations in the currency laws of late years in other countries may have had upon the price of produce. Have you ever studied that question?—I have considered it. I was a very great friend of my old master, the late Professor Bonamy Price, and that was a sort of subject in which I deferred very much to his judgment. My friend told me I had better leave it alone. I know what your views are, and I am almost afraid to make use of the word, but he turned the idea into ridicule. I hope you will not think that I say this in any scoffing way.

Mr. A. Pell.
20 Apr. 1894.

17,873. Professor Bonamy Price has been dead a good many years now, if I remember right?—He has been dead about four or five years, I think.

17,874. And he expressed that opinion to you, I apprehend, under circumstances very different from those of the present day?—But the question had been very much discussed then; the rupee had dropped considerably before Bonamy Price died, I think. Another friend of mine has written on the subject very largely, and indeed troubled me very much upon it. Mr. Moreton Frewen used to send volumes, well, sheets, to me upon it, and I handed all those papers over to Mr. Price.

17,875. Professor Bonamy Price, I recollect quite well, was a member of the Duke of Richmond's Commission?—He was.

17,876. But I do not think the question of bimetallism ever came before the public at all at that time, and certainly it was not ever mentioned or dealt with before that Commission?—I can assure the Commission that there was a great deal of matter put in print upon that subject before Mr. Price died, and put in print by a friend of mine, and I used to take his papers over to Mr. Price. Mr. Price used to express his views to me in this way. He said, "The truth is those "who have borrowed in gold want to pay in silver, "and I think we had better not let them."

17,877. As far as you yourself are concerned you rely for your opinions on the subject, I understand, on what Professor Bonamy Price told you?—Yes, and also on my natural love of a sovereign in preference to any other coin whatever.

17,878. Then you are not of opinion, as far as you have studied the subject, that the appreciation of gold has anything to do with the cause of the fall of prices?—I cannot see it. Now you are getting me perhaps out of my depth.

17,879. I do not want to ask any questions that you do not wish to answer?—If I have got a quarter of wheat to sell, and a man in India has got a packet of cotton to sell, we make a swop, though after all the difference we may pay in bills upon Amsterdan or upon China. Gold seems to be a very useful medium between people who can conduct their business by simple barter, and it is all we want, and I think the question becomes embarrassed if you introduce a quantity of other material, let it be silver, or let it be copper, or let it be diamonds, whatever it may be, as tokens of value. But then this question is far beyond me.

17,880. I understand that you have not studied the question sufficiently to wish to give evidence upon the subject?—No, I do not wish to give any evidence upon it, because it would not be worth anything.

Tenure.

17,881. With regard to the question of tenure, I think you say that you farm your own land to a very considerable extent?—Yes, and I am sorry to say that I rent some too, out of kindness to my landlord.

17,882. Under those circumstances where you farm your own land you enjoy the utmost possible security for all the outlay you have made as far as compensation for improvements would go?—Yes, I do, undoubtedly.

17,883. And yet in spite of that, I am afraid from what you tell us your recent experience has not been very satisfactory?—No, it has been terrible the last two years.

17,884. For some reason, I understand you that you say a further increase of capital embarked in the cultivation of land would be no remedy for agricultural depression?—I do not think it would. I do not think it is a wise thing to put borrowed money in a bad business.

Changes in system of cultivation.

17,885. Can you suggest to us any changes in cultivation—any alteration in your methods of farming which might enable you to improve the position, or which might prove to be a remedy for the depression?—No, I cannot. There are improvements, no doubt, in the clouds that could be made, but I think, on the whole, the English cultivator is a very skilful man, and I do not know what I could tell my fellow farmers that they ought to do which they are not doing. I think, perhaps, one of the difficulties, and perhaps one of the causes of expense with the English farmer, has been the desire he has had to have all his implements made in the very strongest and most expensive way. That has been a really very serious thing with him. The American has his machine made very much lighter and very much

Mr. A. Pell.
29 Apr. 1894.

cheaper, and he chucks it outside if it does not answer, and takes up with a newer invention. But you are very slow to do that in England, and many farmers are running machinery which is ineffective and costly to run by the side of machines that are going at a much less cost because they are disinclined to waste the capital that they spent in the purchase of the thing. The improvement in agricultural machinery has been so very rapid, especially in some classes of machinery, that it has been a source of loss to the farmer who has gone in for modern machinery.

Tenure.

17,886. As a practical farmer of many years' experience, and holding your farm, being an owner cultivating your own land on the most perfect security of tenure, you do not see that any alteration in the laws relating to the tenure of land could be a remedy for agricultural depression?—I do not.

17,887. You have no belief in what you call the remedies advocated by theorists upon this subject?—No, not at all. What is proposed in 1890 as a panacea or a specific will probably in 1893 never be heard of. That has been absolutely the case.

Cattle diseases.

17,888. With regard to the contagious diseases of animals, I understood you to say that you were under some apprehension with regard to anthrax, which was spreading in your county?—Yes, very great.

17,889. Have you any suggestion to make to the Commission for dealing with anthrax?—I am not sure now, but I do not think the slaughter of anthrax animals is compensated for—you would know, but I think it is not.

17,890. That is so?—I think it should be as rapidly as possible, because the character of the disease is rather singular. There is no doubt that it is an extraordinarily infectious disorder, and even when the animal is dead it is as dangerous as when it is alive from any little excreta that drop from it. Therefore it is very desirable to kill off the whole heard at once.

17,891. Is it your opinion that it should be dealt with in the same way as pleuro-pneumonia, and foot-and-mouth disease, and rinderpest are now dealt dealt with—by the central authority, namely the Board of Agriculture?—Certainly.

Technical instruction.

17,892. With regard to the question of agricultural education, have you any suggestions to submit to the Commission?—I should like to say in answer to that, that I have taken a great interest in a movement which has been made in the University of Cambridge, and which you really initiated when you were President of the Board of Agriculture. In 1891 you addressed a letter to the Chancellor of the University of Cambridge upon the subject, and a syndicate was formed then of members of the Senate, consisting chiefly of members resident in the University, to which four were added who were not resident, but were members of the Senate. Those four were the present Duke of Devonshire, Lord Walsingham, Mr. Dent, and myself. The result has been, to make a short story of a long one, that in the University of Cambridge instruction is now given upon the most moderate terms in subjects bearing upon agriculture, and pupils are received at the University of Cambridge who are not members of the University *in statu pupilari*, and not even non-collegiate members. We have given them the name of county students. They have the opportunity of attending the lectures of certain professors—the Professor of Chemistry and others. The education that they receive on scientific subjects is very complete, as good as it possibly can be, and on very moderate terms. What we thought was that some of the young men who were the sons of great landlords who were up at the University, would avail themselves of this opportunity of acquiring this knowledge, which extends not only to such subjects as chemistry and physiology, but to book-keeping and to several other subjects which would be useful to the owners of estates. But we have been disappointed. I do not think there is the son of a single landowner, whose name would be known in this room, who is taking advantage of these opportunities; but there have been sons of farmers. There is a successful farmer, an illiterate man himself, but who married a woman of ability, who has sent a son up who is likely to be, I think, a distinguished man; so that we may do some good. This scheme is supported by contributions from different counties out of the technical instruction funds—Cambridgeshire, Essex, Northamptonshire, Leicestershire, Norfolk, and two divisions of Suffolk contribute to the payment of the professors, and they have also founded some scholarships, but the thing has only just begun in the last two years, and we cannot say what it will end in. There is the opportunity given to a man of getting scientific instruction in these subjects. I am Chairman of the Executive Committee which has to carry the scheme out, and I and those who work with me have most determinedly kept away from giving any instruction in farming; we will not have anything to do with a model farm, or attempting to teach farming. We say that the terms of the University cover 24 weeks. These 24 weeks a young man, if he likes, can devote to this scientific instruction, and there are 28 weeks left for him to go to market with his father and learn, what is equally important, all the methods and practice of farming. We have an opportunity of examining all the experiments on the experimental farm at Woburn; therefore we have no need whatever to start a model farm, because Woburn is very accessible. We have also access to the experiments which are being conducted in Suffolk. No better opportunity anywhere in the world, I think, can be given to young men to acquire a knowledge which is essential, as I think, for landowners in the management of their estates than now can be given at Cambridge.

Mr. A. Pell.
20 Apr. 1894.

17,893. (*Chairman.*) At the University?—At the University. Perhaps the Commission would allow me to put in this paper. This is the sort of statement which was issued by our secretary:—"A Course of "Scientific Instruction in subjects bearing upon Agri- "culture has been organised at Cambridge. The "instruction is in the following subjects:—Agriculture, "Chemistry—Elementary and Agricultural,—Botany "—Elementary and Agricultural, Physiology," and so on. "Opportunties are offered for the study of agricul- "tural law, and may also be provided for the teaching of "veterinary science. In aid of the above object certain "professors and teachers in the University admit to "their lectures, and to practical instruction in their "laboratories, students not members of the University "under the following conditions: that the students "are not under 17 years of age; that the students "give satisfactory evidence that they have received a "sufficient previous education to enable them to take "advantage of the proposed instruction." Then comes a statement of what money is required from the outside. That we have procured from different counties who have joined, and we have had very considerable assistance by grants from the Board of Agriculture in London. Then comes the course of instruction, which I need not read, what the students are to do in the Michaelmas Term, what in the Lent Term, and what in the Easter Term. Now comes the important part: "It "is estimated that any student for the whole course "will have to pay the first year 19*l.* 19*s.*, and the "second 18*l.* 18*s.* in fees; and that for board and "lodging the cost will be from 6*l.* to 8*l.* a term, so that "the necessary expense will be from 38*l.* to 44*l.* per "annum for the whole course." Since this was written my committee have made arrangements whereby we have an excellent common room, and are getting an excellent scientific library, a great deal of it in languages I do not understand—in German and French—and the thing is in very good working order. We have also permission from practical farmers, large farmers in the neighbourhood, to take the students over their farms.

17,894. With regard to the question of agricultural education, apart from the opportunities which are afforded by the University at Cambridge, have you any other suggestions to make to this Commission? You are aware that at the present time a large sum of money is given to the local authorities for the purposes of technical education in which agricultural education is included?—Yes.

17,895. Is that satisfactory to you?—No, I think not at all. I think that scientific instruction in these subjects is a very difficult question, and can only be handled by first-class men, and the idea of a village schoolmaster teaching elementary chemistry and elementary botany out of public funds is to my mind perfectly ridiculous.

17,896. You would rather entrust that duty to a Government Department, for instance, like the Board of Agriculture?—A very great deal sooner.

Dairying.

17,897. Will you tell the Commission whether, judging from your experience, there is a very considerable opening for education in dairy farming?—Something has been done in that way, and already in some of the counties the Technical Instruction Committees have had to entirely alter their early views. I am a

Mr. A. Pell. 20 Apr. 1894.

member of the Technical Instruction Committee for Northamptonshire. A very poor dairy county is Northamptonshire, but in the west of England I know one county where they began with having lectures given upon the subject. I am not sure that there was not a model dairy started, but they altered their plan in a very little time, and they did this: they sent round to the different farmers people who were thoroughly well acquainted with the manufacture of cheese, and who had a knowledge of the principles and the practice upon which the manufacture was to be conducted. Those people travelled round the country. I have a friend who has a large dairy property in that part of the country, and I learn that these people have gone into the dairy and said, "Now, what difficulties "have you got?" "Sometimes we have had the "cheese become bad, not often, but three or four "times or ten times in the year." I know one instance in which the instructor said, "Is that door always "locked?" "No, it is not." "Is it always kept "shut?" "Always." "Always?" "No, we cannot "say always." "How often? Do you not know "that the opening of that door alters the temperature "of your dairy? Lock it, and you will have your "cheese good." In that instance the cheese has been good ever since.

17,898. (*Mr. Elton.*) What county is that?—That was the county of Gloucester.

17,899. (*Mr. Chaplin.*) I understand it to be the case that in the year 1893 we imported into this country cheese and butter alone to the extent of nearly 18,000,000*l.* worth?—Yes, and eggs 3,000,000*l.* odd, I think.

17,900. That is true, eggs, 3,875,000*l.* Could not the greatest amount of this imported butter and cheese be perfectly well produced in this country if the education was adequate? Is there anything to prevent it?—It is beyond me to say that.

17,901. You have not studied that question sufficiently to pronounce an opinion upon it?—I do not think any education will make a hen lay two eggs a day.

17,902. I am not speaking of that; I am speaking about dairy produce?—I think dairy produce depends so entirely upon the quality of the land. For instance, you might take 5 per cent. of the cream off the milk that I send up to London from Cambridgeshire and it would be better milk than the whole milk that I send up out of Northamptonshire. I do not think any education could make that different.

17,903. You are aware that we import great quantities of butter from Denmark, are you not?—We do.

17,904. Which butter is of a very high quality?—Yes.

17,905. They have great facilities in Denmark for acquiring education in making butter. What I want to ask you is this, is there anything in the nature of the climate or the soil of Denmark different from that of England which should not enable us with equal facilities for education to produce quite as good butter as they do in Denmark?—No, I should think not. We are very bad butter makers in England. I should like to say that Denmark owes all its enormous trade of exporting butter to England to education received in England. The enormous exportation of good butter to England is due to a young fellow who was a student at Harpenden. He did not go there with any intention whatever of learning butter-making, but he mastered the great features of its manufacture, how essential it was to study measure and temperature and chemistry, and went back to Denmark and applied all this knowledge to butter. That Sir John Lawes told me himself, or Dr. Gilbert, I forget which.

17,906. I am asking all these questions because I am anxious to elicit from a gentleman of your great practical experience whether, with greater facilities for education in dairy farming, there would not be a considerable opening for British agriculture in that direction?—Certainly we could improve; we have immense room for improvement, especially in the manufacture of butter.

Rates.

17,907. (*Mr. Dalton.*) I think you mentioned that the ratepayers had derived very great advantage in your union from getting the railway properly assessed?—Yes, we have.

17,908. What was the cost of that?—I cannot tell you the cost, but I could tell the Commission some of the difficulties, which are very great indeed in England. They are not so great in Scotland. Indeed, they do not exist in Scotland with respect to the assessment of railroad property. In Scotland, as I daresay is known, there is a public officer who is the assessor of railways and mineral property, to whom the local valuer can go for instruction. In England we have nothing of the sort. If an assessment committee desires to re-assess railway property in the union it has no access to the books of the company. The law does not permit the assessment committee to have access to the books of the company. It really is a most important and a most serious question. You cannot see the books of the company until you have brought the company into court, except in the case of a county rate. If the county object to the valuation of a railroad, the law of England enables the county authority to insist upon the production of books; then a skilled valuer of Newcastle, or of London, whoever he might be, can form an accurate assessment, but in England it is a perfectly monstrous thing that you have to go into court and incur an enormous amount of expense upon a guess. Of course you get as good an expert as you can, and he makes as good a case as he can, but the whole intricacies of the case and the whole grounds upon which the assessment should be formed cannot be unfolded until you have got into court; and in our case I think they sat three days over it. We had a good man and we held our own, and we got the assessment raised. When I was in Parliament I brought in a bill, I forget who was with me, to assimilate the English method of assessing railroads and mines and canals—we are just as much in the dark about mines—to the Scotch practice, and I was fortunate enough by holding my tongue and taking my hat off, to get that Bill past the second reading before the railway people found it out. Then they did me over the committee, and I never got further.

17,909. Do you think it would be a sufficient remedy if the guardians, as well as the county authority, were enabled to demand to see the books of the company?—It would not do all I should like to see done.

17,910. But that would be a small amendment which could be more readily obtained?—What I think is that there should be in England something like what you have in Scotland, only, perhaps, not for the whole of England; an officer to whom the overseer of the poor, who makes the assessment, might go and say, "Sir, I "have got to assess one mile of railway through this "parish; what value am I to put upon it?" I am not carrying it any further. The overseer should merely go to him for advice. I think that would be of enormous importance, and it would very materially assist the landed interest, not being railroad proprietors, if such a change was made in the law.

17,911. Would you consider that speaking generally, railways are not assessed at their full value on account to some extent of the local authorities not having this information, and also to some extent, because they do not like to incur the expense of litigation?—I am sure of it.

17,912. Do you consider that the same rule applies to waterworks, gasworks, and canals?—Say there is a corporation reservoir of 17 acres in this parish, how can the overseer of the poor go to the corporate town and call upon the town clerk to produce his books; he has no power to do so.

17,913. If you were enabled to have these properties properly assessed, you would get an additional contribution to the rates from personalty?—We should; that is to say, if all the other hereditaments in the parish were assessed at their full value. But in several instances they are not so. I know of one case where an endeavour was made to raise the assessment of a railroad company, and the union was upset at once. The counsel for the company said, "Look at this land. "What is the rent? 2*l.* an acre. What is it "assessed at? 15*s.*" The case was all over at once. I think if I might say so, perhaps it is going a little out of the way, that it is very essential that we should have in the country the surveyor of taxes sitting by the side of the committee for the rate, and that the gross value should be the thing to be taken. I think the net rateable value is the most embarassing thing we have got in assessment.

17,914. You think it would be for the benefit of the landed interest if you had a proper system of valuation in that way?—I do; not only for the landed interest, but for the Exchequer. If we had the assessment

Mr. A. Pell. 20 Apr. 1894.

made as it is in London, it would bring in a quantity of property, including a great deal of urban property which is not sufficiently assessed, though the country people know nothing about it.

17,915. That would to some extent relieve the burden of local taxation?—It would.

17,916. But your great remedy would be economy?—Undoubtedly.

17,917. From the history of your union, I gather that not only in the poor relief, but also in the highway and other expenditure you consider economy is the best means of relief?—Yes. It is marvellous to me the little interest that is taken by the owners of property in questions that so materially affect them. Yesterday I was at a very large board meeting in which the owners have a right to sit as *ex officios*. There was not a single owner present, and it was a very important meeting affecting their interest very materially. I was not a landowner. Where I sat I was only a tenant.

17,918. Do you think the Treasury subventions conduce in any way to extravagance? I am not speaking of your own Union; but supposing you have an extravagant Union, do you think the fact that they have got some thousands a year coming to them from the Government would make them still more extravagant?—I think in some instances it would. I have known in Unions an attempt to get into a County Lunatic Asylum an idiot who was not a proper person to be there, because the Guardians said "You will get "the 4*s*." or whatever it was, "back again." I have known that happen.

17,919. Apart from that, might not the mere fact that they were getting something from the Government, say for the cost of their lunatics, make them more extravagant in other items of their expenditure?—No, on the whole I do not think it would. In London, but then that is not extravagance, there is a common fund which has rather, and very properly encouraged the Guardians to put their paupers into the proper receptacles for them when they are diseased. There has been a check upon out-door relief in London no doubt, and people have been better treated in consequence. But I do not think that led to extravagance; I do not think they have made more paupers in consequence.

17,920. You would be speaking then of a well-administered Union?—Yes.

17,921. But supposing you knew of a Union which in your opinion gave a great deal too much out-door relief already, do you think that the fact that they had some thousands a year coming from the Government —— ? To spare.

17,922. To spare, would induce them and encourage them to give more?—No; they are so very ignorant. I have heard Guardians talk about the enormous expense the Union officers are to them, forgetting that it all comes out of the Treasury, forgetting that entirely. No, I think that very many know nothing about it.

17,923. You select police, lunatics, and the administration of Justice ——?—And the buildings connected with them.

17,924. As the three items towards which assistance should be given, because you think they would be less likely to lead to extravagance?—Yes. As all the Commissioners know, we pay nothing for prisons now, but then I have observed in different counties that instructions have come down which have been followed to improve the cells at the police stations for the detention of prisoners. I do not do much magistrates' work; I look on; but I have always said to the others, "Avoid, "if you can, this sort of outlay; it has all got to come "out of the county rate." It has been considered just that the county should not pay for a prisoner, and I do not see what difference there is between a cell which is constructed to detain a prisoner before the bench has done with him and a prison.

17,925. The great remedy would be economy in local administration?—Yes, that would be a great remedy, but still I think that visible property, and recollect I am not speaking of the county landowner only, because urban property pays quite as heavily, perhaps a little more upon these points, visible property ought not to be specially charged as it is now upon those points that I have mentioned.

17,926. Would you continue to leave the local management of it amongst the local authorities?—No.

17,927. You would have a central management then?—What local management has the county authority upon prisons?

Mr. A. Pell. 20 Apr. 1894.

17,928. I am speaking of police and lunatics?—I would not let the local authority have the administration of Treasury money; no, certainly not.

17,929. (*Mr. Channing.*) As to anthrax, that has been found to come on again and again in certain fields and certain farms in Northamptonshire and elsewhere, has it not?—Yes, it has. Cattle diseases.

17,930. It has recurred?—It has recurred after an interval, in one case near me, of 40 years. I have known two or three cases where anthrax was known to have existed 40 years ago and where it broke out again four or five years ago.

17,931. All that I want to ask you on that is whether, in dealing with such a formidable disease, the fact of its recurrence is not an additional reason for placing it under the control of the Board of Agriculture in the same way as the other great cattle diseases?—Certainly, I think so. You would then have some scientific inquiry into the causes, which the Board of Agriculture could conduct very much better than any local authority could conduct. There must be a key to the secret of stopping this disease.

17,932. It might become necessary, owing to the fact of its recurring, for the Board of Agriculture to give orders as to the treatment of a certain field where cases had been recurrent?—Yes. In the cases near my home they dare not and do not put cattle in some fields. There are fields which are only grazed by horses, and occasionally by sheep, because the people think for a certainty that if they put horned cattle upon them those cattle would be liable to be struck with anthrax.

17,933. Have you any experience of breaking up these fields and liming them, and can you tell us how far that is a remedy?—They have not been broken up.

17,934. Has that experiment not been tried?—No, I cannot call to mind that it has there.

17,935. Still, you think it ought to be placed, like other diseases, under central administration?—Yes.

17,936. You stated in answer to Mr. Chaplin that the present rents amounted to about 1 per cent. on the outlay of the landlords in improvements?—I doubt whether it comes to as much, taking England all over. Interest on landlords' outlay.

17,937. Do you take into account in making that estimate, portions of the landlord's capital which have been exhausted, that is, which have been used for buildings, for drainage, and for other purposes which have lapsed, say, an outlay 50 or 60 years ago? Do you include that in your estimate?—First of all, might I say that I do not like what I have stated to be termed an estimate, because it is only a conjecture, except, upon those particular properties which I referred to in the article that I wrote. There it is an estimate and a precise one, founded upon figures; but with regard to England generally it is only conjecture. Bringing the land from its original condition of scrub land, or prairie land, or whatever it was, to a state which a farmer could go on to has cost much more than the land would make, and the present rent does not pay 1 per cent upon that capital. You must consider what has been done. You are not to consider only the removing of the scrub, and the getting rid of the trees, and the enclosing of the land. That is not all the landowner has done. That was no service at all unless he had made the river navigable and the road passable, and I might even go further, and say unless he had put up some place of worship—all of which came out of the land, and all of which is fairly charged to the debit account of the making of the land in England.

17,938. But in estimating what per-centage on the capital outlay by the landlord the present rent represents, it would not be fair to include the outlay in buildings which had been taken down afterwards, or drainage which had ceased to be of use, or the outlay for other purposes which had ceased to exist, would it?—Am I to understand the question in this way: that I must consider, in reference to certain expenditure (the evidence of which has gone by because the buildings have been removed), what profit the landlord made while those buildings were in existence, and carry it to the credit account. Is that what you mean?

17,939. What I mean is this: that in estimating rent as partly covering interest on outlay you would not say

Mr. A. Pell.

20 Apr. 1894.

that a landlord was entitled to estimate for interest on an outlay carried out 50 years ago, the whole usefulness of which has lapsed?—I would give him credit for anything that he got for the outlay. The outlay has been continuous in the history of England. I have buildings on my own property that were put up in the time of the Tudors. My ancestors did not own the land then, but somebody had to pay for it all. They are of very little value to me now, but I suppose they have been of value to some of the proprietors of the estate before I was born.

17,940. They are still existent?—I wish they were not. I have got to insure them, and they do me very little good.

17,941. (*The Chairman.*) I suppose the way you have made the estimate is this: you have assumed that the land was in its original state on the one hand?—Yes.

17,942. And then looking at it in its present condition you have made a rough estimate of what it would cost to bring it to its present state?—Not even to its present state, but to a state fit for a tenant to go on it. In what I wrote I took the illustration, which is a very recent one, and it is one that could be made use of—Wychwood Forest, which was brought out of what you may call the natural state of England not very many years ago. When it had gone through certain operations which were performed there, I think by the Ecclesiastical Commissioners, it was turned over to a tenant at a rent. I do not want to have anything to do with the tenant or what he did afterwards. I am only considering the cost that was incurred in reducing in this instance—Wychwood Forest—to a state that I or anybody else could go upon it with my horses and plough it and sow it.

17,943. Applying that same process to the whole of England, and taking the present rental of England you have come to the conclusion on a very rough estimate that the rent does not represent more than 1 per cent. upon the total outlay?—I do not think it represents 1 per cent. It is a very interesting question, and I think with the help of such books as Mr. Garnier's "History of the English Landed Interest" something may be made of it; a student may get a real estimate of what the owners of the English soil have lost by their very commendable efforts to make the land cultivable.

17,944. (*Mr. Channing.*) We have all read your article with the greatest interest, and I have studied it very closely in past time. My question is to this effect: that you could not contend on that reasoning that a landlord in estimating—as he fairly is entitled to estimate in assessing his rent—whatever interest he can obtain on his outlay, could not take into consideration expenditure, except expenditure within a reasonable period, in actually fixing his rent?—I do not think any landlord would in fixing his rent. It is a matter of bargain, and of how many tenants are willing to come. I do not think I, or any landlords, consider what we have spent upon the land. We are only too glad to close our eyes to anything so unsatisfactory. We see what the tenant is ready to give, if he is a good man.

17,945. But you would not expect to get interest on an outlay made more than 50 or 60 years ago?—In such cases as the fens where you have got a submerged district of considerable extent that was worth very little, and where directly the water was taken away the land became valuable land it might be allowed, but these are very exceptional cases.

Farming to a profit.

17,946. You say that you succeeded in getting a profit out of the land you were working yourself up to 1892, I think out of the Cambridgeshire property?—Yes, it was a reasonable profit.

17,947. "No cause to complain," I think, was your expression. You, of course, farmed the land well?—Fairly, but I do not think I have been an over good farmer.

17,948. You do not starve the land in manures and or cake, I presume?—I would not spend a sovereign if 19*s.* would do. I look upon farming as a business of small economics, apart from a science. I am not talking of scientific instruction on the subjects bearing on farming, but when you come to the absolute management of a farm you find then that it is a business of very small economics, and that many old practices have to be followed. For instance, the man who gives his orders to his servants over night as a rule is not so good a practitioner as one who is up in the morning to meet them at the gate. Those are little things to do with the practice of farming, but they are essential.

Mr. A. Pell.

20 Apr. 1894.

17,949. What I meant in asking you whether you farmed the land fairly well was whether you consider it a good policy to put good stock and to use good seed, sound cake, and good manures on your land?—Certainly.

17,950. I am not asking you whether you believe in extravagant farming, but in careful farming and the choice of the best stock and the best seed, and so on?—Yes, but not advertised seed and not advertised manure. I am very shy of anything that is advertised.

17,951. I think you said that the best quality of produce still paid fairly well as compared with inferior produce?—I think the best produce of barley pays, but no produce of wheat pays, you get something out of the best produce of oats.

17,952. It pays better than the worst, I mean?—It does.

17,953. It still commands a better price?—Yes, and you lose character too—that is another thing—if you always put upon the market bad things.

17,954. I am asking you that question because you said that you did not believe—and I want to get it clear on the notes—that putting money into farming now was a remedy or would meet depression, but I suppose you would put a limitation upon that?—I would not put any speculative money into it. Of course, if we have got arable land we must plough it, and we must have the best plough, and the best horses and the best men, and we must pay them, but if a man came and said, "You had better give up your ploughing and take to "scuffling, or some bewilderment of that sort, "and you must spend a little more money in that "way," I would say, "I will keep where I am, and I "will carry on what we believe to be the proper "process of farming in the best way I can, only not "spending one farthing more upon it than is essential." I do not mean by that to cut a man down, for there is nothing that pays better than a well-paid farm labourer if his powers are equal to his money.

17,955. I gather that you would not be surprised to hear that even in a county like Essex we have had evidence before us that a thoroughly good farmer who goes in for good stock and good management on a dairy, and who has 950 acres, has made a net average profit on his capital of 6 per cent. since 1879?—May I ask whether he was a Scotchman.

17,956. I think not, but I am not quite sure?—I know that the Scotch are doing fairly well in Essex. I know of owners who are doing very well in Essex, but they are great milk owners.

17,957. I am merely asking this because your previous evidence would give the impression to a reader that you discourage putting a reasonable amount of money into farming?—I should like to see that Essex man. Is he a grower of seeds for Sutton? so many of those Essex men unite that with their other farming.

17,958. He sells fat stock, and supplies milk to London?—He might do something with the milk.

Valuations.

17,959. One other point; you expressed an opinion that the present system of valuing was very unsatisfactory?—Most unsatisfactory.

17,960. I think we may put your opinion thus: that you would like the condition of the farm thoroughly scheduled and inventoried at entry?—Yes.

17,961. And that you think it would be possible to have a valuer of some kind who would be able to check that schedule and that inventory at the end of the tenancy, and award what is really a just and fair compensation on that system?—I think he would; at all events, he could protect the landlord repeatedly. You have only got to look into the law reported cases where a tenant seeks compensation under the Agricultural Holdings Act, and would be likely to get it, but the owner comes in under that Act with a counter-claim, and the counter-claim very often is proved to rest upon the very reasonable foundation that the fences have been neglected, and the roofs of the buildings neglected, and that most wilful and careless mismanagement of the landlord's part of the estate has been exhibited by the tenant, and the tenant's claim then comes to next to nothing or worse than nothing.

17,962. May I take it that you consider it a fair test of what the farm is at entry, and of what it is at going out, if you can state the quantity of produce, the num-

Mr. A. Pell. Apr. 1894.

ber of beasts and sheep, and so on, it can carry?—Yes; for the last two or three years, not just one year, and the condition of the farm. In London, if we alter any buildings, and if we are fearful of any claims being made for ancient lights, we photograph the buildings before the work is done. I can see no difficulty in photographing a hedge, or in photographing farm buildings before the tenant comes in. It would be a very little expense to get an accurate exhibition of the condition of the holding before the man comes on. I may be wrong, but that is what I had in view.

17,963. We have had an objection to your suggestion made by another witness, to the effect that if you had this close scheduling of the condition at entry, and then another man to examine the farm at the close of the tenancy, you would get different results; do you think that would be so?—It might be; but I am all the time contemplating a case which, I think, is a reasonable one to contemplate, of a tenancy of 40 years, when, perhaps, the original landowner is dead, and the original tenant of the farm is dead; then, I think, more than ever, it is important that the successors, the people who have got to deal with the property 40 years after the original date, should know as exactly as we can enable them to know, the condition of the holding when the original tenant came on. I am sure that I cannot put too strongly before the Commission the great difference it would have been to owners of property if an accurate record had been made of the condition of what they have to offer. What owners do with regard to land is so unlike the treatment or the practice they would pursue if they were letting their house in London, and yet that is a mere song compared with the land.

Free trade.

17,964. I want to ask you whether you still adhere to your well-known free-trade opinions?—I am what is called a bigoted free-trader.

17,965. You have not changed your opinions owing to the present condition of agriculture?—Not in the slightest; I daresay free-trade will hurt me very much, but I must bow to a righteous policy.

Dairying.

17,966. (*Mr. Elton.*) Are the creameries being extended in the villages or small towns about you?—Not much with us in Northamptonshire. There is one little factory which has been started on Lord Spencer's property, and friends of mine have to do with it, but it has not been very successful. But what they make is remarkably good, and commands the first price in Northampton.

17,967. I suppose their butter is more even than if it came from the several farms?—Much more.

17,968. Do you anticipate, then, improvement to agriculture from the enlargement of the system of creameries?—Yes; I think creameries, no doubt, would be serviceable for those who are going to have their dairy produce made into butter.

17,969. The superiority obtained by the Normandy butter and Brittany butter as they call it, chiefly consists in the fact that you can depend on the regularity of the article?—Certainly.

17,970. Do you think we could get that up in England?—I am sure we could.

17,971. Just as they did in Denmark?—I am certain we could.

Tithe.

17,972. About those corn averages. Do you suppose that the inquiry which was held satisfied the agitation on the subject?—No, I do not think it did.

17,973. I thought you said you had not heard much about it since?—Very little now.

17,974. Then the agitation has practically ceased?—No, it has not ceased in Essex, because the tithe, or tithe rentcharge rather—that is the proper way to put it—is higher in some instances than the rent that the freeholder could get upon his land.

17,975. Do you think the question is not a pressing one now?—I should be very glad to see it settled. I think that there should be something done to enable the owner of the tithe and the owner of the freehold to make some arrangement between themselves. Here is land worth 5*s.* an acre. The tithe upon it is 5*s.*, we will say. It is not cultivated at all because there is nothing left to the landlord. I think if there was legislation to enable the tithe owner and the landlord to come together and say: Now then, will you take less tithe and leave something for the rent of the land a tenant might be found.

Mr. A. Pell. 20 Apr. 1894.

17,976. What I was asking was whether the farmers' minds were much agitated on the subject at present?—I am a tithe owner myself, and we have very little agitation and very little trouble about it as far as I am aware in Cambridgeshire. The tithe is a heavy one, but then the land is good.

17,977. There is a question about the rating that I should like to ask. The railway company, you say, notwithstanding the difficulties, was rated?—Yes.

17,978. And the rate was upheld?—Yes.

17,979. But in another case the railway company pointed to a man who was not sufficiently rated, and that stopped the transaction?—It upset the case.

17,980. Did it absolutely cease; did they let the railway off on that ground?—The case dropped. The assessment committee could not sustain their ground of assessing the railroad because they had got all the other hereditaments assessed at manifestly below the value, at all events those which the railway company adduced.

17,981. Did you ever know of a case where the railway company's objection caused the other hereditaments to be largely increased in rating?—No, I have not known that.

17,982. Did you ever hear of the rating of machinery question being raised by a railway company on the ground of their being rated severely, while the machines in the factories were not rated?—No, I have not heard of such a case. I am quite aware that the railroad is assessed upon the whole undertaking, and not upon the land only.

17,983. The rating of machinery case arose in a union where I live, and I thought you might have known of it?—No, I know nothing of it.

17,984. Then you say the Leicestershire factory frames could not be rateable?—No, not if the frame is a moveable frame.

17,985. Do you know that the judgment in a long litigation, which occurred in consequence of the railway rating, was that the frames were rated, though they were moveable?—I did not know that; I am very glad to hear it.

17,986. And that it was upheld by the Court of Appeal?—I did not know that.

17,987. They said the contrary was hardly argueable?—I did not know that. I thought the first take off from the original power, the main shaft, was always rated, but I did not know that it went further.

17,988. I am talking of things which rest on the realty by gravitation and not by being fixed?—I was not aware of it, but I am very glad to learn of it, and I will make use of it.

Sale by live weight.

17,989. That is so; we have found it in our union. About the weighing of cattle you said the Irish dealers were in favour of buying by live weight?—I think they are.

17,990. I know they are; they have told me so on another Commission; were the farmers in favour of it?—No, except a few, and they are afraid of being boycotted. I have known a farmer boycotted who had his cattle put upon a weighing machine at a very important market in England. He put up a machine himself. He farmes about 1,000 acres of land. The dealers perfectly well know that he weighs his animals before they come into the market, but they do not say anything about it when it is done in that way. I think that there again, if I may say so, we want some assistance, either from the Board of Trade, or from the Board of Agriculture, with reference to the machines that are already sanctioned as proper weighing-machines. As we have got them now in some cases, not in all, they really are useless. There are machines sanctioned to be used at markets that do not pretend to weigh within 28 lbs. of the real weight, and 28 lbs. of meat is of some value.

Market tolls.

17,991. Have you found the market tolls system a great burden on your agriculture?—No, the tolls in the markets that I send to are very light. I think corporations being the sole proprietors of the markets in many cases, is very mischievous.

17,992. Do you approve of the recommendations of the Markets Commission which were to the effect practically that the market tolls should be done away with as far as possible after allowing for the bare expenses of management and repair of buildings?—No, they do

not concern me; the tolls are so light that one does not feel them. When the bill comes in and you put the railroad carriage and the commission down, the toll is a mere nothing in comparison. Of course, it is something, but we should have to pay for it, somebody would have to pay for it at any rate, if they were got rid of.

The Agricultural Holdings Act.

17,993. Now in reference to the Agricultural Holdings Act, I think you are the author of Clause 19 relating to the item valuation?—Yes. That Bill as brought in originally in the House of Lords had two great defects in it, and absolutely as it would have left the House of Lords a tenant could have gone in and claimed compensation under the Act, under the custom of the country, and under a lease.

Valuations.

17,994. I would not trouble you with the details of your own clause. You say that the clause is not always carried out?—I am certain that the clause relating to items of valuation is not; and you may say that there is a universal desire to evade it.

17,995. In the awards do they not generally follow such a form, as for a hedge on clay acre, for a road from brown acre to black acre, or for an osier bed, and so on? Is that not sufficient information as to the items?—I think there would be, perhaps, such a thing as an osier bed put down, because that would be an improvement of the first class. The valuations are made up in this way: "To so much for artificial manuring unexhausted" without a statement, which my clause contemplated, of when it was put on and what quantity was put on.

17,996. Do you know of any case where an award has been returned to a valuer on the ground that his description was too general?—Not one; but I do know of a case where the landowner found he had been seriously, as he thought, robbed, and where he would have made use of this remedy under my clause, but that he was too late, because his own valuer had consented to this valuation and award, and it was considered too late then to go back upon the Act.

17,997. But quite lately have you not noticed in the courts that an award was sent back to the valuer? I think it is very likely the same case, in another stage, as that to which you refer, if he was a west countryman?—I have not noticed such a case.

17,998. The court appears there to have upheld your view to some extent?—I am very glad to hear it.

17,999. That is so. It is very likely the same gentleman for all I know; and they have sent back the award, because notwithstanding that he had consented to too much, yet the law was imperative that it must be in particulars and not by way of generality?—I am very glad to hear it, but I was not aware of it.

18,000 Then I do not understand you to say that the items must be minutely described in the award like every lock on a gate?—No. But when I drew that clause I meant the time at which the improvement was made——

18,001. Reasonable particulars?—Yes; the time and the nature of the improvements.

18,002. And the extent. I leave out what you said about photography, with the remark that I suppose you do not attach much importance to the fact that the courts of law consider that photographs of buildings and objects can prove almost anything?—I did not know it.

18,003 You do not trouble much about that?—I always think they are very useful, as good as measuring.

18,004. Yes; to show whether there is some ancient light or not, as you said, but not to show the condition of a bank?—It would not show the condition of the land, but it would show the condition of a hedge or gate, I think, or of a building, whether the roof was in good repair or not.

The making of land.

18,005. I am going to ask you one question about the article you wrote, which I read with great interest at the time, on the making of England. I understand your Wychwood Forest case very well, because it is one of the worst last bits of England left unmade; and it is easy to see that they took it and made it out of a waste?—Yes.

18,006. Then I think you mentioned some Surrey land?—No, Shap Fell.

18,007. I will mention it, then. Surrey land, which may be described as a platform on which you put 10*l.* worth of chalk and soil per acre, and then you have got a piece of land; you have made the land there in that case?—Certainly, you would have made it.

18,008. But a very large part of the country, of course, was made in what we may call primæval times. You do not go back to the bringing of the country into cultivation by the Romans, do you?—No.

18,009. Still, they did bring most of it in?—I should go back to the time when the piece of land you have in view was in a state of scrub. I am quite aware that you would have to go back to the early days of the Romans for some portions.

18,010. Certainly, I could take you up to the earliest stone age. You said you had taken typical estates?—I took typical estates.

18,011. Would not the best parts of those estates have been cultivated for 2,000 years?—I do not think so. A great deal of Lord Leicester's property really was running wild. There were bustards on it in the last century.

18,012. I said a great part of those valuable estates, or of any other valuable estates, a great part of the country. You see you might take almost all the corn land in East Kent?—I have no doubt the corn land of good quality in Kent was cultivated very early. At least my experience has satisfied me that our forefathers cultivated only the best land for grain, because now grain having become an unprofitable business to grow, and some of the land in the Midlands having been laid down, it is astonishing what good grass land we are getting out of the arable land. In my own case I am quite surprised at the quality of the grass, and now I am beginning to see that our forefathers broke up and cultivated only the best land for grain.

18,013. I did not want to go into any details; I only wanted to note the fact that our forefathers a very long time ago brought a very great deal of England into cultivation?—No doubt when the commonable fields were laid out away from the waste.

18,014. Any time you like; take the Norman Conquest; you have read the Doomsday Book, I know?—We are getting now into very interesting matters.

18,015. You would find it very interesting if I worked it out, because it is part of the factors of your 1 per cent. You were not speaking historically?—No.

18,016. (*Chairman.*) Your estimate was not based upon a historical view of the question?—No.

18,017. But rather I understood you to say an estimate of what would be the cost now at this moment of changing the land from its original state to its present condition?—Perhaps we must settle what is meant by its original state. I am quite aware that from the very earliest historical times, if you take any parish, there was a considerable quantity of land that was Doomsday land, which had been recovered from the waste and had become cultivable land, and taxable under crop.

18,018. Perhaps it had not been waste for a thousand years before?—But then behind all that stood the wood and what was called the waste, and that was the land which the English landlord brought into cultivation, and which has cost him so much money.

18,019. (*Mr. Eton.*) Then I do not take it as a historical fact that England was made by the application of a sum of capital on which 1 per cent. would not be paid now, adding up the rent together; but I take it as a reasonable proposition made by you that if England had to be brought into cultivation from a state of waste it would take a sum of money which all the profits now would not represent 1 per cent. upon?—I think it would.

18,020. That is the way I may take your theory?—Yes.

18,021. Without absolutely binding yourself down to history?—I must protect myself there. I took special cases where I could get the figures.

18,022. (*Chairman.*) That was another branch of the argument so to speak. Besides this rough estimate which you made, you took three particular estates, and you showed that within the last 30 or 40 years—— ?—Yes; or 100 years.

18,023. A very large sum of money had been spent upon them, the interest of which hardly amounted to the rent?—It would not amount to the rent, and it was money sensibly invested. I mean not by visionary people at all.

Mr. A. Pell. 20 Apr. 1894.

18,024. We have had evidence of the same kind before us in the case of Lord Wantage's estate, showing what very large sums have been spent during the last 30 years, and with what very poor results?—Just so.

Income tax.

18,025. (*Mr. Elton.*) I take the effect of the memorandum which you were good enough to hand in to be this:—that people who lose money by farming can, now, if they prove the loss by proper accounts not only be excused from paying the tax, but can go and get back a reduction of the money that they had paid on other branches of their industry?—On other investments.

18,026. I think you are going to put in the memorandum?—Yes; I think it would be useful to hand in a print for the sake of the landlords in general. (*See* Appendix IV.)

Tenure.

18,027. There was one question which you did not quite answer, and on which I only ask for information in case you would want to say anything. You were asked whether the question of tenure meant the question of tenures of occupiers or the tenures of owners; do you find any hindrances to agriculture in consequence of tenures by owners which you did not describe?—No. Of course the conveyance of land is expensive; but then I am old fashioned enough not to wish to see jobbing in land. When I buy a bit of land I do not want to job it. There will be an expense when I purchase it for stamps and title.

18,028. I did not mean that. You are not much troubled with copyhold incidents and that sort of thing, are you?—I am, indeed. Mine is a very strict manor. I only wish all land could pass as it passes in a copyhold case.

18,029. I think your manor is celebrated for the way it is kept up?—We keep it very strictly.

Results of farming.

18,030. (*Chairman.*) How long have you farmed your land in Cambridgeshire?—A small portion of it since about 1845, and the larger portion for 11 or 12 years—12 years, I should think.

18,031. You did not farm the larger portion of it in 1879, did you?—I was farming a considerable portion then, and then I left it for awhile.

18,032. Had you experience of the bad seasons in 1879?—I was farming it in 1879.

18,033. Not the greater part of this Cambridgeshire estate?—Yes, I certainly was in 1879, but not all of it. There is one large farm—at least what we call a large farm—which came in after 1879.

18,034. You had very bad times then for two or three years?—Very bad indeed in 1879.

18,035. After that you recovered, I suppose?—After that the times were not so bad; still they have not been good times since 1879.

18,036. I understood you to say that until the last two years you made a profit?—Yes; the last two years have been disastrous years with me.

18,037. Till then you made a profit?—Certainly.

18,038. What do you mean by a profit?—I paid my rent, and the rent was a good one.

18,039. Did you pay interest on your capital?—No, but I got a high rent.

18,040. What did you charge yourself with for rent?—I call 47*s.* a good rent for the property, including drainage tax and tithe.

18,041. That is a very handsome rent?—That is a good rent.

18,042. Besides that did you make interest on your capital?—No, we worked with a very small capital.

18,043. What did you pay yourself on the capital?—I think the capital was about 6*l.* per acre.

18,044. What per-centage did you make on that?—Nothing; I lost the interest on the capital.

18,045. Then you paid yourself 47*s.* an acre?—I got the rent.

18,046. If you had reduced your rent you might have made interest on your capital?—If I had reduced my rent I might have charged in the books interest on the capital. I have reduced the rent now over the whole of the estate, as a matter of account in the books, to a pound an acre.

18,047. How does the rent you charge yourself compare with your neighbours?—I am sure I do not know what one large proprietor near me gets, but a great deal of land has been thrown on his hands.

18,048. What is generally the rent of land in your neighbourhood?—It has been the best land in the neighbourhood. I should think when ours was 47*s.* that the rent in the adjoining parishes would be close upon 40*s.* *Mr. A. Pell.* 20 Apr. 1894.

18,049. As much as that?—Yes, close upon 40*s.*, including drainage tax and tithe.

18,050. Then the last two years you have lost in consequence mainly of the bad seasons?—Yes, we had a very bad season, and the harvest the year before last was a very bad harvest. Then having laid down a good deal to grass, cattle became of very serious importance in farming; then came last year with that embarrassing dry season, and a fearful drop in cattle.

Price of cattle.

18,051. The fall in price of cattle was due to the drought, I suppose?—Yes. I have stood in Northampton Market, say at the beginning of November, and I have watched scores of calves sold—good calves that would have commanded at the best times 50*s.* apiece—and I have seen them sold for 2*s.* 6*d.* to 5*s.*

18,052. All that was due to the drought?—Undoubtedly that was the main cause.

18,053. There was no feed for the cattle?—The drought was the main cause.

18,054. Now, with the return of good seasons do you think it is probable that you will again make a fair profit?—I have a good opinion of stock. There has been a very great rise in the last week.

18,055. A very great rise?—Yes, in store stock.

18,056. That, I presume, is on account of the prospect of there being more fodder for the cattle?—Yes.

18,057. Therefore, immediately the price of lean stock began to rise?—Yes, but that again will be kept down by the small quantity of hay that is left in the country, as the result will be that everybody will mow in order to get up their stock of hay.

18,058 But subject to that, you may expect that stock will rise in proportion to the prospects of the good fodder?—I think so, undoubtedly; they are doing so now.

Prospects of farming.

18,059. Then I must ask you whether, looking to the future and to the prospect of average seasons, you think you can again make a profit out of your farm?—I hope I shall; that is all I can say. I have got plenty of cattle, because I have held on to my cattle, and never did I see the corn land look better. You will hardly believe, but I am going down to Cambridgeshire this evening, very much because they are overdone with grass on a part of the property which is on that beautiful green sand.

18,060. I think we may presume that the hot season of last year has done the land a good deal of good?—I have no doubt it has.

18,061. And that will come out in the course of the next year or two?—The meadows were full of subaquatic plants; they abounded in the flora of the meadows, but this last year's hot summer did for them, and we shall now come back to the better grass. It is very curious how the flora was affected by the previous damp, wet season.

Demand for farms.

18,062. Are the farms letting in your neighbourhood?—I have asked several agents upon that point, expecting it to be raised here, and I find that there is a better demand for farms.

18,063. Quite lately?—In Cambridgeshire, upon this large property which adjoins me, there was a large farm taken the other day which had not had a tenant for 13 years. I said directly, "That must be a stranger coming there," but no, he was a relation of the old farmer who left it 13 years ago. I suppose it let at a very much less rent, I suppose that is really the bottom of it.

Rates.

18,064. Has your farm been assessed at 40*s.* an acre for the poor rate?—No, the assessment is most unsatisfactory. It is a mere conjecture. I appealed against the assessment on one farm. I said: "I will let it to any of "you gentlemen, or any two or three of you"—there were very good farmers among them—"at 50*l.* for the 108 acres," and nobody would take it at that, but they assessed me at over 100*l.*

18,065. I am talking of your own case, what has your own farm been assessed at?—Taking it all over, I think we are assessed in Cambridgeshire at about a pound an acre, taking the good and the bad together.

Mr. A. Pell. 20 Apr. 1894.

18,066. Is that reduced as compared with a few years ago?—There has been some reduction.

18,067. What has the reduction been?—I could not tell you.

18,068. Still, there has been a reduction?—I know there has been a reduction.

18,069. In consequence of the good management of your union, I suppose, the rate has been reduced?—I was talking of the Cambridgeshire land just now in the answers to those previous questions. I can tell you all about Northamptonshire too. There has been an enormous reduction there.

18,070. The good management then was in Northamptonshire?—Entirely. I do not want to say anything against what my Cambridgeshire friends do, but still it is different there.

Income tax.

18,071. Then as regards the income tax, have you paid it upon your actual profits?—I will tell the Commission what I have done. In Northamptonshire, where I am a tenant farmer, I pay just what they ask on Schedule A. for my landlord. I protect the landlord in one way. I always send the demand to him. I say, "You "are being charged a great deal more than you ought to "be charged." But then I have done with it. I think it is right that I should let the landlord know. In regard to Schedule B. I serve a notice on the proper form, on the surveyor of taxes in Northampton, saying, I object to the assessment made upon me under Schedule B., and I accompany this objection with a statement from the ledger, giving the headings of the customers, showing the profit and showing the loss—the debtor and the creditor account. When I first did that, which was about eight or nine years ago, the Commissioners sent for me, and they said, "Who keeps the books;" I said, "I do;" they said, "We wonder how you find time for it." They asked a few questions about it, and I showed what I paid. Since then they have never asked to see the books, but the surveyor has asked if I would be kind enough to note against the items taken out of the ledger what they were for, so that—and quite right too—he might see that among the expenses on the farm there is nothing that ought to be charged to capital. Every year till this year—I have not got it yet—generally they are very prompt in returning me the whole of the money. So much for Northamptonshire. In Cambridgeshire I believe we are going to send in a claim upon the whole property, including the manor fines, the tithe, and everything the whole affair of Albert Pell, and what his income is from this estate, satisfying the Commissioners at the same time that no part of the property is farmed for amusement, and that it is a business affair.

Mr. A. Peel. 20 Apr. 1894.

18,072. Then I understand you that in Northamptonshire you have applied to the Commissioners for a return of the income tax?—It has always been returned to me ever since I made it.

18,073. And you have succeeded in getting it without much trouble?—Yes.

18,074. We have been told that farmers generally do not avail themselves of that?—No, but they are beginning to know a little of it. I have met a farmer on the road, when he has been riding to market, and he says, "I want to get my tax taken off; what am I to do?" and he has only got to show the Commissioners something written on the back of an envelope. But they listen to him, I believe—they are very fair.

18,075. I suppose we may take it that the farmers very seldom keep accounts?—I do not think they do very systematically.

18,076. There is a great want of business habits in that way?—I think it would be very useful to them if they kept a cost book now and then, so that they might detect at what particular point it was that they were losing money; that is what a manufacturer does.

The witness withdrew.

Adjourned till Thursday next at 12 o'clock.

Thirty-second Day.

Thursday, 26th April 1894.

PRESENT:

THE RIGHT HON. GEORGE JOHN SHAW-LEFEVRE, M.P., IN THE CHAIR.

Viscount COBHAM.
The Right Hon. HENRY CHAPLIN, M.P.
ROBERT GIFFEN, Esq., C.B.
Captain OWEN THOMAS.
FRANCIS ALLSTON CHANNING, Esq., M.P.
JOHN CLAY, Esq.
CORNELIUS NEALE DALTON, Esq., C.B.
ROBERT LACEY EVERETT, Esq., M.P.
JOHN GILMOUR, Esq.
GEORGE LAMBERT, Esq., M.P.
WILLIAM CUTLACK LITTLE, Esq.
WALTER HUME LONG, Esq., M.P.
CHARLES WHITEHEAD, Esq., F.L.S.

HERBERT LYON, Esq., *Secretary.*
R. F. CRAWFORD, Esq. } *Assistant*
FREEMAN THOMAS, Esq. } *Secretaries.*

Mr. ROBERT GIFFEN, C.B. (a member of the Commission) examined.

Mr. R. Giffen, C.B. 26 Apr. 1894.

Fall of prices since 1872.

18,077. (*Chairman.*) You have at different times since 1872 written on the subject of the changes of prices, and you were examined before the Royal Commission on Agriculture in 1882, and again before the Royal Commission on Gold and Silver in 1887?—That is so; and I should like to add what I think may be interesting for the Commission to know, that in 1872, when I commenced writing, the fall of prices which has occupied the public mind so much of late years, had not then commenced, but in that essay I anticipated, and gave grounds for anticipating that there would be a general fall of prices. I was set in motion by a gentleman, a distinguished economist, Mr. Thomson Hankey, who was of opinion, owing to the abundance of gold consequent upon the Australian and Californian gold discoveries, that the rise of prices which had been going on for a good while before that, was likely to continue; but the conclusion which I came to at the end of a very long investigation was to the contrary effect. I think also I should like to add that a good deal of my writing on the subject was anonymous; I was writing a good deal about it in the city between 1872 and 1876, and very much to the same effect as that essay, which is published, and

Mr. R. Giffen, C.B. 26 Apr. 1894.

Mr. R. Giffen, C.B.
26 Apr. 1894.

which appears as one of my Essays in Finance, the first series.

18,078. You anticipated therefore in 1872 the fall of prices which began a few years later?—Of course, I spoke in a very tentative manner, and instead of expressing an opinion I collected a good many facts and statistics from which that appeared to be the obvious inference, and as a matter of fact the inference was justified by the event.

18,079. When did the fall of prices begin?—I think it commenced almost immediately after 1873: and in the earlier years when it commenced those of us who had been accustomed to study these subjects were, of course, not able to say whether the fall of prices which then had commenced was the ordinary fall of prices which frequently occurs after a period of inflation, or whether there was not something more. The next essay which I wrote was in 1879, and I read it before the Statistical Society, as to the fall of prices of commodities in recent years, and I discussed that very point, whether what had taken place was an ordinary fluctuation from high to low prices, such as takes place after every period of good credit, or whether there was something more in connexion with that fall of prices, and I came to the conclusion, as will be seen by a reference to the essay, that there was something more than an ordinary fluctuation from high to low prices, such as we find after a period of good credit.

18,080. In the few years before 1873 there had been a great inflation?—A great inflation.

18,081. And there was a reaction, but it was accompanied by a distinct fall of prices due to other causes?—I think there was a fall of prices due to other causes. When we came to 1879 we began to perceive that it was a fall of prices to a somewhat lower level than what the depressed period before 1872 had shewn, and therefore we began to infer that there was something more than an ordinary credit fluctuation in question.

18,082. I do not know whether you have examined the figures of the prices of wheat and the results per acre of land in England. I think it showed that 1879 was the first time when the prices of wheat did not rise in proportion to the deficiency of the harvest?—I cannot say that I observed that in particular, because I think about that time the question of the deficiency of the English harvest was becoming less and less important, owing to the intercommunication with foreign countries and the diminution of the crop of wheat in this country itself in proportion to the total consumption. I should not like to go into that without examining it.

Contraction of money.

18,083. Then, in your opinion, was this fall in prices due to the contraction of gold?—Well, I should like, before I express an opinion on that point, to point out that a good deal of confusion in the controversy and in the discussions which have taken place has arisen from people not being careful to be strict in the meaning of the language which they use. It seems to me that economists who had talked about appreciation or depreciation of money before the time that I wrote, people like Professor Jevons, had always been careful to use the phrase as the equivalent of a general fall or a general rise of prices; and if the use of the phrase is confined to that, it is very convenient. The question arises whether the appreciation, as we are dealing with appreciation, is due to a contraction of money or not; and I think it is most inconvenient to use the phrase appreciation in the sense of a contraction of money, for that gives rise to a great confusion, and we should confine ourselves to a strict use of the language, and speak of the appreciation of money as merely the equivalent of a general fall of prices, and then discuss the question how far and in what sense that can be considered due to the contraction of money. There is no doubt that at that time the opinion which I expressed was that to some extent the fall of prices, the general fall of prices, was accounted for by a contraction of standard money—and I lay special stress on the phrase "standard money." Many people have taken the words that one has used, and when you have been speaking of standard money they have taken your words and have applied them to currency, and then they say that the fall of prices is ascribed by Mr. Giffen, or somebody else, to a contraction of currency; whereas that was not justified by any language which you had used at all. All that you had said was that the fall of prices was accounted for by a contraction of standard money, and in this case the standard money being gold, it is simply an ordinary case of pressure upon a particular commodity, gold, and a demand for it causing a rise in its value. That is all that I ever meant, but in that sense there is no doubt I spoke of the contraction of gold at that time, that is, between 1872 and 1880, as helping to account for the general fall of prices which had then taken place.

Mr. R. Giffen, C.B.
26 Apr. 1894.

Fall in wages of labour and price of commodities compared.

18,084. Was the movement in the direction of the appreciation of money, or the general fall of prices you have referred to, accompanied by a fall in the value of labour?—That was a point to which a good deal of attention was given at that time, and I find in that first essay, which I wrote in 1872, I assumed very much that the fall in the price of commodities, which was quite general, would be accompanied, as a matter of course, by a fall in the wages of labour; and as late as 1883 I find that Mr. Goschen, in that speech which he made to the Bankers' Institute, was under the same sort of belief; but, as far as I can judge now, one thing which has come out in all these recent studies of the question is that the price of labour and the price of general commodities do not necessarily rise and fall together; that you may have commodities going one way and labour going another. That is to say, that if the price of commodities remains stationary, and a real improvement in the condition of labour is going on, you will have a rise in the money wages of labour; on the other hand, you may have the money wages of labour remaining stationary or even fall a little, and if there is an improvement in the general condition of labour going on, you may have a considerable fall in the prices of commodities. That is what has been going on, I believe, during the last 20 years. Labour and these wholesale commodities have not moved *pari passu*; and the case you have had is that the wages of labour remains comparatively stationary in money, and a real improvement in the condition of labour is represented by the general fall of prices which has taken place; that is to say, the anticipation of myself and other economists who were acquainted with this subject, 25 years ago, that labour and commodities would go together, has not been fulfilled, and I believe the reason is that sufficient attention had not been paid to the facts which occur in a progressive community. In the old times economists having to deal with communities much more stationary than communities of modern times found that they could include the price of labour with other commodities, and the two things went very much together; but now it is not so.

18,085. Would you say that since 1879 the wages of labourers have not fallen, or that they have not fallen in proportion to the fall of prices?—They have certainly not fallen in proportion to the fall in prices, and I doubt very much, taking labour all round and setting one kind of labour against another, whether you can say that the wages of labour have fallen at all.

18,086. I am now speaking of the money wages?—I am speaking of money wages too.

18,087. Then, if the money wages have not fallen, or fallen very slightly, in comparison with the price of materials, the real wages of labour must have increased rather, because the articles of food and so forth are cheaper?—That I think is the effect of the evidence—that there has been an improvement in the real condition of the labourer arising in that way. The improvement might have arisen in another way; that is to say, with the price of commodities remaining stationary and the money wages of the labourer increasing.

18,088. Has that in your opinion been generally the case in other countries as well as in this?—I think so, it has been comparatively general.

Recent changes in prices and incomes compared.

18,089. You propose, I think, to lay before the Commission tables containing some remarks on recent changes in prices and incomes?—I propose to put those tables before this Commission, and partly for this reason, that some of those tables which are to be found in that paper of mine read before the Statistical Society in 1888, on "Recent Changes in Prices and Incomes Compared," have been carried on by me for a great many years. They were not prepared for me for that paper, but had been in existence a good many years before. There is a short paper on prices to begin with, and a reference to index numbers. Then there are tables showing the imports per head, and points of that kind which all bear upon the subject; and tables of wages. I thought it would be useful simply that I should put these tables before the Commission for their convenience if they should happen to refer to that paper which I read in 1888, which contains the latest views I have to express upon the subject.

Mr. R. Giffen, C.B.
26 Apr. 1894.

18,090. Perhaps you will shortly explain the different tables?—The first table is a table of the prices of leading wholesale commodites in January of each of the years 1873, 1879, 1883, 1885, and in December 1888, and November 1893 compared. (*See* Appendix, Table I.). That table was commenced by me in the early discussion of these matters in 1873. I continued it in 1879, when I read the paper before the Statistical Society to which I have referred. I continued it in 1883, and 1885, for the purpose of other papers which I was writing, and which have been republished in the second series of my Essays in Finance. I continued it in 1888 for the purpose of that paper on, "Recent Changes in Prices and Incomes," which accounts for the date of December 1888, and then, some time ago, having in view the discussions which were likely to arise, I continued it with the figures for November 1893. I do not think it worth while to change them, because they are practically much the same at the present time.

18,091. (*Mr. Everett.*) Is there any substantial difference between the figures of one year and another in January, and in November and December?—The seasonal changes are not important in these questions at all.

18,092. (*Chairman.*) From that first table I think the main fall was between 1873 and 1879?—A very large portion of the fall was between 1873 and 1879.

18,093. And that I presume follows that they were only the reaction from the inflation of 1873?—From the evidence that I have to give afterwards, it will appear that many of the special causes of the contraction of money, to which I have referred, existed with special force between the years 1873 and 1879, or thereabouts, and they have not been operating with so much force all round now.

Fall in price of wheat.

18,094. The exception to that appears to be wheat, which fell from 55*s.* 11*d.* in 1873, to 39*s.* 7*d.* in 1879, and it fell to 27*s.* 6*d.* in 1893, and it is even lower than that at the present moment?—There is no doubt that wheat is something exceptional, but an obvious remark to be made is, that it does not follow that all articles take their changes exactly at the same time; and my impression is, that take it all round, the fall in cotton has been quite as remarkable as the fall in wheat, but the bulk of the fall in cotton undoubtedly occurred between 1873 and 1879. I do not think it is quite possible to account for all these changes without an essay on each case.

18,095. In the case of coal there is a remarkable fall between 1873 and 1879, from 30*s.* to 19*s.*, and it has remained fairly stationary since 1879; and that was exceptional, you say?—That is an exceptional thing, and the price in 1893 is also exceptional, it would not be so high now.

18,096. It has gone down again since then?—Yes. But of course the figure of 30*s.* for coal in 1873, as well as in 1893, was itself a very exceptional figure.

18,097. Well then, the second table is the comparison of the index numbers, is it not?—The second table (*see* Appendix , Table II.) is the comparison of the leading index numbers which have been employed in making comparisons of the general rise and fall of prices; of course the object of an index number is primarily to reduce all prices to a common denominator as it were, so that you can add them up, and say what the average change is. It would be quite absurd to put together the price of a ton of pig iron at 127*s.*, and the price of a ton of coal at 30*s.*, and the price of a pound of cotton at 10*d.*, and then divide them by three, and say that is the average price. But what you do is, you start with a basis of 100 in each case, or an equal number in each case, and then the per-centage of rise or fall can be worked out for each article on the average. That is the object of an index number; and I do not think I need explain what the effects of those changes are, because I think you will have some more evidence on that point, and the effect is now comparatively well known. Of course I am always speaking with reference to the paper which I read in 1888, where you will find a great many of these matters explained.

Imports and exports compared of shipping.

18,098. Then what do you say as to your third table?—The third table (*see* Appendix , Table III.) shows the average imports per head, and the total imports and exports per head of the population of the United Kingdom in quinquennial periods, and that is compared with a column of the entries of shipping per head, and the general effect of it is to show that in certain years of the period there was a great increase in values per head and then you come to a time when there is a fall in values per head; but as far as one can judge these changes and values do not quite correspond to the changes in the quantities of business as indicated by the entries of shipping per head, and if you compare the two together, you have some idea of what we believe to be changes in money connected with changes in the monetary standard itself, viz., that the scale had been changed as it were. For instance, if you look at the imports per head, you will find that between 1880–84 and 1885–89 there is a fall in the imports per head from 11*l.* 11*s.* to 10*l.* 4*s.* 10*d.*; that is to say, a decline of 11 per cent. But if you compare that with the entries of shipping per head, that is to say, the movement of ships which carried the same goods, you will find that there is an increase from 0·86 to 0·89; so that the entries of shipping were rather increasing at the very time that the values of the imports per head were diminishing.

Mr. R. Giffen, C.B.
26 Apr. 1894.

18,099. Then in the following period from 1890 to 1893, there is an increase both in the quantity of imports and exports per head, and also in the entries of shipping?—An increase of 8 per cent. of the imports per head, and an increase of 10 per cent. in the entries of shipping, showing again, as far as one can judge, although you must not reason too finely on figures of that kind, that the increase of business was greater than the increase of values; that there was some difference between quantities and values.

18,100. In the period of inflation from 1870 to 1874 there was a very large increase in the entries of shipping, and also a very correspondingly large increase in the imports and exports per head?—I think, on the whole, if you take all the periods together that the increase in the imports per head was rather more than the increase in the entries of shipping per head. That seems to indicate the inflation of that time.

Profits assessed to income tax per head.

18,101. Well, then, would you explain your next table?—The next table (*see* Appendix , Table IV.), shows the gross amount of profits assessed to income tax per head, and the use of it in the paper to which I referred was to show that along with the increase of the assessment which goes on with the increase of population there had been a great increase in the nominal values per head throughout the country, which again seems to indicate that down to about 1875–79, a good deal of the rise in those assessments per head was a rise of nominal values merely; that the notation had been changed; but after 1875–79 the assessments per head remained much the same until about 1890-92, when there is again a slight increase in the assessments per head.

18,102. From 1875 down to 1880 they were almost stationary?—They were almost stationary.

18,103. Then between 1882 and 1883 and 1884 they seem to have risen again?—These are in quinquennial periods, a method adopted for convenience; but the table below gives you the progress in each year, so that you can see what the changes were from year to year. (*See* Appendix , Table V.) Of course tables like these are subject to a good deal of observation, as there are certain changes of the assessments to the income tax which are made from time to time, but I do not think that there is anything very material which would be noticed in using the figures generally in the way I have given them.

18,104. You are content to show that alterations in prices have not affected really the profits of the country?—They tend to show that the alterations of prices were felt much more immediately after 1875–79; that is, then you had a state of things in which the assessments only increased in proportion to the population of the country, whereas before that they had increased much more, and that indicates some sort of general change in the purchasing power in the money itself in which those things are expressed.

Wages of labour.

18,105. Then the sixth table is devoted to the subject of wages?—To a comparison of wages; and I think if one looks into that carefully it has the effect which I have described, that there is nothing to indicate the fall in the rates of wages corresponding to the fall in prices which occurred after 1875. (*See* Appendix , Table VI.)

18,106. You have got the rate of money wages of the agricultural labourers in a separate table, I see?—Yes, the agricultural labourer is dealt with separately. (*See* Appendix , Table VI.)

18,107. Then take the year 1892, for instance, what do you say about that?—That was the year when I got the figures mostly from the Labour Commission. Of course, with reference to a table like that, it would be subject very much to the observations of the evidence which we have heard before this Commission, in which we have had some statements made with reference to

Mr. R. Giffen, C.B.
26 Apr. 1894.

the wages of labour in different parts of the country; and there is a great difficulty in making tables, in a matter of that kind, from the statistical conditions not having been properly observed in stating rates of wages at different times in the past. I think in future the statistics of wages will be much better than they have been in the past.

18,108. I think the general drift of the evidence before us, and, so far as I have observed, before the Labour Commission, has been that there has been a rise of wages between 1870 and 1880, and then a subsequent fall again?—A slight fall in some parts of the country.

18,109. But that the fall in 1880 did not bring it back again to the position of 1870?—Yes.

18,110. But since then; between 1880 and 1892 there has been a very slight fall?—Some go back. But that is subject to many statements made before this Commission itself, so that we must be very careful in putting any exact figure upon the rise and fall of wages since 1880.

18,111. The total you have given here is that in some few cases there has been a fall between 1880 and 1892, but in the great majority of cases the wages have remained stationary?—That is the effect of it.

18,112. And in some cases slightly, that was probably due to local causes?—Mr. Little may be able to tell us something about it, but it is quite possible that slight variations may arise in this way, that they are different people who give figures for 1892 from those who gave them from 1880-81, and you do not know exactly always that they have done the same thing; there are changes of that kind which one ought to be aware of.

18,113. At all events you come to the conclusion that there is no corresponding movement to the wages of labour as compared with prices?—I am sure of that, and I have given them here separately, because we expected, in 1872, and a few years afterwards, if there was a general fall in prices of commodities, that the wages of labour would also have gone along with them, and that has not occurred.

Improvement in wages since 1875.

18,114. Can you make any calculations, assuming those figures to be accurate, of what has been the real improvement in wages having regard to the lower prices of the principal articles of consumption?—I should be inclined to think about 20 per cent.

18,115. (*Mr. Lambert.*) From when?—Since about 1874 and 1875.

18,116. (*Chairman.*) From 1875-92, the real wages of labour estimated on articles of food and raw materials has improved by 20 per cent.?—Yes, and I am inclined to think that that is perhaps a minimum statement in this way, that we can measure a general fall of prices of commodities by taking certain leading commodities as to which we can follow the prices over a very considerable period, but one of the difficulties in making general statistical statements on a subject like that is, that in the case of a period like the last 20 years you have great changes in the commodities in use, and new things come into use, or old things come to be more in use, relatively to others, than was formerly the case. I might mention for instance, such a thing as oil for lighting, and another thing, electric light, and inventions of that kind which come into use over a given period, and of which the whole community get the benefit, and where the fall of price, one may say, is almost indefinite, as you have the opportunity of getting a thing which you could not have got at all at the beginning of the period. So that if you find there is a general fall of prices amongst known things that you can follow, and you are speaking of a community which is in a progressive condition, like the community of England at the present time, you may be sure that the general fall of prices which you can trace is somewhat less than the actual fall of prices of which the community gets the benefit. That is my impression.

18,117. Then you would conclude from these tables that no adjustment has been possible as regards wages, in the conduct of business, either of manufactures or of agriculture?—I think not; that unless the quality of labour has improved, there is no adjustment.

18,118. As to the quantity?—The quality and quantity; there may be changes of that kind, taking the country all over, and allowing for the greater efficiency of the machines which are employed. Adjustments may have been effected in that way.

18,119. Have you compared those tables with the condition of pauperism and the number of people out of work?—I have not especially dealt with the condition of pauperism, but I am able to speak of it as a well known fact that year by year all through this period pauperism has declined, and I see no reason to believe that there is any diminution of employment over the country generally at the present time compared with what it was 20 years ago. There is not the slightest evidence of that.

Mr. R. Giffen, C.B.
26 Apr. 1894.
Decline of pauperism.

18,120. Then the depression, whatever it may be, which has lately occurred from the low prices has not affected the class of labourers?—I think not. I think labour is not more abundant and the labourer is better off.

18,121. (*Mr. Chaplin.*) That is generally?—Generally.

18,122. (*Chairman.*) I think the next two or three tables have reference to matters somewhat later in your evidence?—Yes.

Imports of gold.

18,123. Would you refer again to your statement?—With reference to these tables as to which I have been giving some explanations at the request of the chairman I thought myself that the first point to which I would call attention would be Table IX. which has not yet been referred to. (*See* Appendix , Table IX.) Table IX. I referred to in order to call especial attention to the different result as regards the imports of gold into the United Kingdom during the last few years from what the results were in the period between 1872 and 1887. In the first period of the table, the one which I dealt with when I was writing in 1872, namely, between 1858 and 1871, you have an excess of imports of gold into the United Kingdom of, in round figures, 68 millions sterling. In the second period, between 1872 and 1887 you have facts before you which seem to me to indicate the great pressure upon gold, and you find that at the end of the period the excess of imports into the United Kingdom is 10,195,000*l* only. And now in the last six years the excess of imports of gold into the United Kingdom begins to resemble what took place between 1858 and 1871, and you have an excess of imports over exports in the last six years of 31 millions sterling, and later on I mean to refer to those facts, along with others which seem to me to show that the circumstances relating to gold have changed somewhat during the last few years, and whereas there was contraction and pressure between 1872 and down to 1887, that the pressure has been somewhat relaxed of late years and that is a point which ought to be brought before us in a question of the discussion of future prices.

18,124. These tables, I presume, do not take into account what I may call the leakage of gold, any gold taken out of the country by travellers?—We must not put too much stress upon the figures and assume that actually 68 millions came into the country between 1858 and 1871 more than went out of it, because there is that leakage going on and that applies to the last six years. In looking at that point at different times, I have come to the conclusion that there is a continual annual leakage of about a million sterling that comes back as an import, and never goes away as an export; these figures are subject to that observation.

18,125. (*Mr. Lambert.*) Would it be so much as a million sterling?—There is ample evidence of that, I think.

18,126. (*Chairman.*) Then if that is so between 1872 and 1877 there was a real decrease in the quantity of gold?—As far as one can judge. If you take into account the fact that about two millions of gold was being used in the arts all that time, there must have been considerable pressure between 1872 and 1887.

18,127. (*Mr. Everett.*) May I ask if there was any reason why you did not begin earlier than 1858?—The reason I did not begin earlier was that I could not go back any further at that time; the statistics did not exist; you had the exports, but not the imports, or *vice versâ*, I forget on which side the defect was; but that was the reason why, when I wrote in 1872, I commenced in 1858.

18,128. (*Chairman.*) And as to that large amount of 31 millions which has been imported into the country since 1888; is a large proportion of it in currency or in the shape of bullion?—I have not investigated that. If Mr. Channing would like to know, I could easily tell him. The thing is quite easily followed out in the annual statement.

18,129. How do you account for the very large increase of nine millions of imports in 1890?—That was

Mr. R. Giffen, C.B. 26 Apr. 1894.

the year of the Baring crisis, and part of it was brought over specially by an arrangement between the Bank of England and the Bank of France. Generally the effect of a crisis like that, although it occurred late in the year was to cause a lot of gold to be obtained by way of precaution not only when the crisis occurred but in anticipation of the crisis.

18,130. (*Mr. Lambert.*) As to that million, does it go in leakage? Do not foreign travellers bring money into this country?—There is not much money brought by foreigners to this country as compared with the money taken out of the country by the English people.

18,131. Have you taken that into account?—I do not think it is a material point. I have considered it; I have had occasion to think of it.

Agricultural production of United Kingdom.

18,132. (*Chairman.*) I think you have now to give us a table showing the agricultural production of the United Kingdom?—I have got a calculation made of the amount of agricultural production in 1891, based upon the actual prices of the day, on a method similar to that followed in the calculations of Mr. Howard and Mr. Turnbull, which are well-known, I think, in the agricultural world. Then I have got a calculation made of what the production of the same quantities of each article would have realised at the prices of 1874. These calculations are shown in Tables XI. and XII. (*See* Appendix , Tables XI. and XII.)

18,133. I see the difference in the two calculations is between 299 millions and 222 millions?—Yes. The 1891 calculation shows that the agricultural production might be valued at 222 millions sterling. When you apply the prices of 1874 to the same quantities you get a figure of 299 millions sterling, showing a fall on the average between 1874 and 1891 of 25 per cent. The object of that is to bring out, not merely the special fall in particular kinds of agricultural produce, but what the general average is, allowing for the proportion in which each quantity enters into the total. I may say that these figures were prepared for me by a gentleman in the Board of Trade, who is himself a practical agriculturalist, and who went into the details. I think that in some cases, perhaps, the changes are rather more than I should have made out myself, but on the whole it seems to me that the comparison is a very fair one, and that the general change in agricultural prices, allowing for the effect of particular articles according to their importance in the agricultural economy, comes to about 25 per cent.

Fall in price of milk.

18,134. The tables give the fall in the price of milk as from 9*d.* per gallon to 6*d.*?—That was one of the items which I think are perhaps exaggerated. I think it arises in this way, that the figure of 1891 is taken from a calculation of Mr. Rew, and that the figure of 1874 is very much the price which this gentleman, who is well acquainted with dairy farming, and who is an owner of dairy farms, found that his own particular product of milk, butter, and cheese, had been fetching. There is no doubt that there is a very considerable difference between 1874 and 1891, but subject to a criticism of that kind upon particular items, it seems to me that the comparison on the whole is a very fair one. If you were to go into particular items you would have to take account of such a fact as this, that the recent calculations are for 1891, in which the price of wheat happened, exceptionally, to be rather higher than it has been on the average during the last two or three years, and other corrections of that kind would have to be made if you were going into it minutely.

Price of agricultural products.

18,135. These tables seem to show that in respect of those articles which are grown in this country, and of which there are no considerable imports, there has been no great reduction in price—potatoes, hay, and straw for instance?—As to potatoes, that is the effect of it; but as to hay and straw I think that perhaps the table is not so representative of the actual facts of a change of price, because there are great difficulties in getting any effectual statements as to the prices of hay and straw at such a distance of time, and the figures are substantially the same at the different periods.

18,136. That may be inaccurate then in respect of hay and straw?—Not much stress can be laid upon it in that way—in the absence of good information.

18,137. But in the case of potatoes probably the figures are accurate?—I think the figures are accurate, some pains have been taken about them.

18,138. The reduction in price in them is considerable?—Yes, but as to hay and straw there are naturally great difficulties in the way of getting any idea of what the average prices of hay and straw are all over the country.

Mr. R. Giffen, C.B. 26 Apr. 1894.

Price of meat.

18,139. In the case of meat you show a reduction?—From about 65*l.* a ton to 50*l.* a ton. I think that corresponds fairly well with the changes that we have seen recorded in meat. I think I may point out that as far as one can tell the reduction in the price of meat has been very largely in the inferior qualities, and that you do not trace the same reduction in the very best qualities; but that is just one of the points that one has to take care of in a calculation of this kind.

Price of dairy produce.

18,140. As regards milk, cheese, and butter, I think the evidence before this Commission so far does not indicate a fall in price so large as is shown in these tables?—That would be so, but yet the gentleman who made the calculation for me is very well acquainted with dairy farming, and claims that a very considerable change has occurred according to his own experience—much more than would be indicated by some other figures as to imports. Still, these statements are put forward not as perfectly accurate in every detail, but as showing the general effect of the change of prices, allowing for the proportion of each article.

18,141. These tables do not give a real comparison of the production of the country in the two years because there has been a great change in the cultivation?—There have been great changes of cultivation.

Lessened production of cereals.

18,142. And there has also been very much less corn of all kinds produced?—Yes. Table XII. (*see* Appendix , Table XII.), is made out upon the assumption that the same quantities were produced in 1874 that were produced in 1891, but of course we know that the same quantities were not produced. It is only a mode of focussing what the fall of price really means.

Fall in price of wheat.

18,143. I see there has been a great reduction in the production of corn and an increase in the production of meat and dairy products?—Yes. The fall in the price of wheat has been much greater than the fall in anything else.

18,144. (*Viscount Cobham.*) But there has been a diminished production on the whole?—There has been a very greatly diminished production of cereals on the whole, and that would have the effect of diminishing the total gross produce of agriculture.

Fall in price of wool.

18,145. (*Mr. Chaplin.*) The fall in wool has been almost as great, or greater?—The fall in wool has been very great indeed. At the beginning of the period wool was still benefiting by the after effects of the cotton famine in the sixties, and I think the price of wool was rather exaggerated, but since then there has been a great fall.

18,146. I thought, speaking purely from memory, that in 1874 or about that period the price of wool was a good deal higher than is estimated in these tables?—I could not go into details with you upon that point. If you would like me to do it, I could obtain further information.

Value of agricultural production in 1874.

18,147. (*Chairman.*) I think Sir James Caird made an estimate of the value of the agricultural production in the year 1874?—Yes; not the year 1874 precisely, but about that time. Sir James Caird's estimate was about 260 millions sterling, and that was made either in 1874 or some years before then. That was the general figure which he took, and of course, as compared with the estimate for 1891, that still shows a very enormous reduction.

18,148. You would consider, I presume, that the change in the gross return of an old-established industry like that of agriculture would necessarily produce great perturbation and cause a redistribution of profits and wealth?—Yes. Whether we go into a question of appreciation of money or anything of that kind the effect of such a great change in the prices of the gross produce of an industry like that of agriculture must necessarily involve a redistribution of wealth and a great immediate perturbation. By the redistribution of wealth of course I mean that it involves a great fall of rents, and perhaps a loss of profit to the tenant farmer; and the perturbation in the industry consequent upon it of course is the origin of the existence of this Commission itself.

Effect of foreign competition.

18,149. How far do you consider it may be due to more competition and the greater imports of foreign produce?—I think that the foreign competition which would have been felt in any case, has, perhaps, been felt in an aggravated form owing to the change in the scale of money prices. If there had been stationary

Mr. R. Giffen, C.B.
26 Apr. 1894.

prices on the average—which might have happened—then to give the labourer the advantages he has now, compared with the former period, there must have been a considerable rise of money wages like what took place between 1850 and 1874, which would have affected money profits *pro tanto*. But rents and profits otherwise would not have been affected. The burden of mortgages and other charges would have remained less than it has become by the increase of the purchasing power of the money in which they are expressed. This different effect upon rents and profits of foreign competition in different circumstances of money accounts for a good deal of the feeling about low prices. Foreign competition has not been the same thing as it would have been had there not been what economists call an appreciation of money, otherwise a general fall of prices. To put the matter shortly, my view is that in any case foreign competition must have reduced rents, the real reward of labour having greatly increased here in the last 20 years, but the nominal reduction would not have been so great as it has actually been. Eventually it is of no consequence what the money is. Everything gets adjusted to the scale in time, though there may be great perturbation in the transition. But I consider that the effect on rents of a rise in the real reward of the labourer is permanent, and to that extent, if the foreigner continues able to produce at present real prices, rents must remain permanently lower, measured by their purchasing power (and apart from any question of money) than what they were 20 years ago. To this cause of change money does not matter. As the real reward of the labourer has increased the real reward of other interests in land must be less, production remaining substantially the same. If agricultural prices had not fallen so much as other prices, or had fallen more, the effects would have been different from what they have been; but substantially I consider that there has been no greater fall in agricultural prices, taking them all round, than in other wholesale prices.

Fall in agricultural prices and other prices compared.

18,150. Then you say that in the case of wheat, and possibly wool, there has been a greater fall of prices?—If you mix them up with the other agricultural prices, you cannot say that the fall in agricultural prices on the whole has been much greater than the average of wholesale prices.

18,151. Possibly not, but the effect of those two special items, which of course affect the position of certain classes of farmers very much and the rent of certain classes of land—— ?—No doubt.

18,152. Must be very much more serious?—It is always important to remember when we speak of averages that there may be a great many effects upon particular classes that are quite different from what the average is, and I think that is one of the things which you must always remember when you speak of averages.

Fall in prices of wheat and wool.

18,153. The figures tend to show that there has been something more than the general appreciation of gold or the fall of prices due to the appreciation of gold which has effected the great reductions on wheat and wool?—I think there is probably something special in the case of wheat and wool, but then we have also to consider that what is special in the fall of price in these two particular cases may also be temporary when we look over long periods of time, and it is quite possible that in the case of both wheat and wool you may have some special recovery of price in the next 10 or 20 years, so that we must not assume that this is absolutely permanent.

18,154. But 10 or 20 years seems rather a long period?—No doubt.

18,155. And in the meantime the producers of these particular products would suffer proportionately more?—But the fall has been going on also over a very considerable period.

Rise in wages of labour.

18,156. I understand you think what the agricultural interest is suffering from is not merely the fall in prices but also the increased remuneration of labour?—I think the increase in the real remuneration of labour is a very important matter that ought to be distinguished from the fall in prices altogether, because that has had an effect upon agriculture which would have been felt whatever the change in money prices had been. I may put it in this way, suppose out of 100 acres the labour used in a former time to absorb 30 acres of the gross produce, that is 30 per cent., then the real remuneration of the labourer increases, and whatever the money is, he gets in money the equivalent not of 30 acres but of 36 acres. That change when it happens must affect the other interests in agriculture very seriously, and very likely it must affect the landowner who receives the rent, because he then receives as his share of the gross produce the produce of a smaller number of acres than he did before. That is the effect of the competition between the labourer and the landowner. This is not a question of money at all, but it is a question of what the labourer actually receives.

Mr. R. Giffen, C.B.
26 Apr. 1894.

18,157. Can you form any opinion as to the causes of the increased remuneration of labour during this period?—Nothing, except that the progress of invention and the continual accumulation of capital have all been to the advantage of the labourer.

18,158. And the reduced price I suppose for carrying commodities from one part of the world to another?—It is part of the progress of invention that you have been able to bring produce from a great distance to the labourer in this country.

18,159. At the same time I presume you would say that there is no evidence that there has been any falling off in the demand for labourers or in the employment for labourers taking them as a whole and disregarding special circumstances in particular places?—Taking the labourers as a whole the labourer has been in demand the whole time.

Effect of change of prices on agriculture and other industries compared.

18,160. Then in regard to the special complaints of agriculture as compared with other trades what have you to say upon that point?—With regard to that question, I think I should like to point out that the magnitude of capital invested in land, the fixed capital, and the large share of the gross produce which the owner of the land and the tenant farmer together have received may be counted amongst the causes why the effect of the change of prices has been so much felt, because there has been a great reduction of the profits received by certain classes without an immediate adjustment of all the different things that earn the profit. I find for instance that in shipping it is not an uncommon thing that only 10 per cent. of the gross receipts of the shipping industry go to profit, but in agriculture, I think, if you put the tenant's profits and the landlord's rent together it would not be too much to say that frequently 50 per cent. and upwards have gone to the tenant and to the landlord together. Consequently when there is a reduction in the value of the gross produce, which must be felt by the tenant and landowner together, there is a great outcry, although there is no immediate necessity for adjustments to enable the tenant and the landowner to live at all. If you have a great reduction in prices in a business where only 10 per cent. of the gross receipts go to profit it is absolutely necessary and indispensable that the people carrying on the business should make an adjustment by which they can carry on, or the business would come to an end. But it is not so necessary in agriculture, where there is a very large percentage of the gross produce appropriated to profit in some form or other; the business can still go on although the profit is reduced. Then I think in another way the landowner suffers in agriculture and that is that practically he only receives the margin of a margin. Say that the margin as between the tenant farmer and himself—that is what they get—is 50 per cent., the landowner only gets a portion of that 50 per cent., say 30 or 25 per cent., then of course, as we all know, many of the landowners are themselves indebted, they have mortgages and other charges to meet and their margin is much smaller and would very easily be swept away by a small reduction of the value of the gross produce.

18,161. What you mean by the margin of a margin I suppose is this, that wages must first be paid and then the profits of the farmer must be paid?—Yes.

18,162. And last of all comes the rent?—Last of all comes the working landowner, who may have mortgage charges and rent-charges and other engagements to meet. I think also it is important to point out that agriculture in this country has not been a progressive industry. I have compared it with railways in which you have the same condition of a large amount of the gross income paid as profit either to debenture or preference shareholders or to ordinary shareholders. The owners of railways have not in fact suffered as the owners of agricultural land have suffered, partly for this reason, I think, that railways have been a progressive business, and the proprietors of railways, therefore, have not gradually become in a worse position, but have been able with some difficulty to maintain their profits. If their business had been non-progressive like that of

Mr. R. Giffen, C.B.
26 Apr. 1894.

agriculture then they would have suffered as the owners of agricultural land have suffered. These seem to me to be the special circumstances why the suffering in agriculture has been so great from causes which have also affected other businesses where there have certainly not been the same complaints.

Effect of depression on assessments of land.

18,163. I believe you have obtained a return from the Inland Revenue Department showing the effect of the depression on the assessments on land?—Yes, the return was not obtained specially for that purpose, but it was obtained specially to compare the rental of England as it was just after the tithe settlement of 1836, or as soon as we could get a figure for it, and the rental of England at the time the return was obtained, that was about 1888–89. I thought with reference to some evidence which has been put before the Commission that it would be very interesting to give the facts which appear in this return. I refer to the evidence of some witnesses which was to the effect that in spite of a large expenditure upon their agricultural properties during the last 40 or 50 years, the rent they are receiving at the present time is no more than the rent they were receiving at the time when they began. I put in Table XIII. a summary of this return, which shows that while Schedule B. in 1842–43 gave a total assessment of 42,127,000*l.*, the amount in 1888–89 was 42,342,000*l.*, showing substantially no increase of rental in 50 years, notwithstanding the large capital expenditure in the interval. I think these figures quite confirm the evidence which has been given us by some of the witnesses. (*See* Appendix , Table XIII.)

18,164. In the interval between 1842–43 and 1888–89 the rent of land had at one time risen considerably, had it not?—I think as compared with the present time the rental was at one time 25 per cent. more than it is now—that is to say, about 50 or 51 millions.

18,165. In the case of England alone the assessments are now brought down rather below the point at which they were, are they not?—In the case of England alone the assessments have been brought down from 39,589,000*l.* to 39,238,000*l.*

18,166. Whereas in the case of Wales there is an increase?—In the case of Wales there is a sensible increase in every county, and the increase in all, I think, is from 2,538,000*l.* to 3,103,000*l.* Of course the statement for 1888–89 is now a little out of date, and I am quite sure that if we had the figures for the very latest date there would be a positive reduction of rental as compared with the period 1842–43.

18,167. In the case of Essex and Suffolk the reduction is to a point considerably below 1842, I think?—In Suffolk the reduction appears to be from 1,216,000*l.* to 1,054,000*l.* I think in Essex the change is not quite so great, because of the difficulty of separating the urban parts of the county from the purely agricultural parts.

18,168. (*Mr. Everett.*) You have tried in these tables to keep that separation I suppose?—We took Schedule B., but even with that proceeding I am not quite sure that we show the true effect upon agricultural land exclusively, because there must be a good deal of Schedule B. which is occupation land or which is land connected with villas and things of that kind which make it very difficult to follow.

18,169. (*Chairman.*) I see, for instance that in Surrey where the assessments were 476,000*l.* in 1842, they are now 549,000*l.*, nearly 100,000*l.* increase?—Yes.

18,170. That would be purely due to villa land, I suppose?—I believe so; but there are great difficulties in following it out minutely. Of course, those who are interested in it, if they went over it parish by parish, and looked into the return, would probably be able to make very interesting observations, because then you could know when you were dealing with purely agricultural districts.

18,171. At the same time the value of house property has, I see, enormously increased?—The increase in house property is very remarkable indeed, being from 35½ millions to 120½ millions all over England and Wales.

Present prices of agricultural produce compared with 1842-3.

18,172. Do you know how the present prices of agricultural produce compare with what they were in 1842–43?—I think we may take it that apart from cereals the prices are rather more now than they were then, but what the general effect upon agricultural production would be it would be rather difficult to state. My impression is that, on the whole, it would be found that prices on the average are a little more.

18,173. What are your anticipations with regard to the future. Do you expect that there will be a further fall of prices or no?—My impression is that if you look at the subject in the same way that I was induced to look at it in 1872 you will come to the conclusion that we are just about to see, in all probability, a turn of prices in the opposite direction to what we have had. How far it may go on is, of course, uncertain, and one must be careful not to prophecy at all in these matters, but merely to state the grounds upon which it seems tolerably safe to form a certain conclusion, or to draw a certain inference, without putting oneself exactly in the position of a prophet, and saying that you know this and you know that about the future. The broad grounds upon which I found this opinion are, first that in recent years there has been a general increase in the production of gold, much of it under very favourable conditions.

Mr. R. Giffen, C.B.
26 Apr. 1894.

Increased production of gold and its effect on prices.

Extraordinary demands for gold.

18,174. (*Mr. Everett.*) What do you mean by favourable conditions?—That the gold seems to be easily extracted, and that it seems to be a very profitable industry to obtain it; I speak especially of the production of gold in South Africa. On the other side the extraordinary demands for gold which were to be foreseen in 1872, and which actually occurred, and other extraordinary demands which have since arisen, appear for the moment to be satisfied.

18,175. (*Chairman.*) What are the extraordinary demands to which you allude?—The demands for Germany and for the United States were the demands that were especially in view in 1872, and for some years afterwards. These were quite certain to come Amongst other extraordinary demands which have since arisen, and which have been satisfied, are the demands for Russia in particular, which has accumulated a very large sum of gold.

Austria's demand for gold.

18,176. (*Mr. Chaplin.*) Do you consider that the demand for Austria is satisfied?—I do not think that the demand for Austria is so serious a demand, and I think that, to a considerable extent it has been satisfied. I do not think that the demand for Austria was ever likely to be so serious as the demand for Germany or the United States.

18,177. Do you know what the demand was?—I think it was between 30 and 40 millions sterling, if I remember rightly.

18,178. Are you sure it was not a great deal more than that?—No; I could not say for certain because I have not gone into the question what the demand for Austria was likely to be.

18,179. (*Viscount Cobham.*) Was that for currency purposes or for war purposes?—For currency purposes, nominally, possibly for war purposes in reality.

18,180. What about Russia?—In Russia it was for war purposes, I think; there was no pretence of currency in that case.

18,181. (*Mr. Chaplin.*) As regards Austria, you would not be prepared to say that, in your opinion, the demand there is satisfied?—I could not say that the demand there is satisfied; but I speak of the demands generally as being more or less satisfied.

18,182. With regard to the demand for India, is that satisfied or is that only just beginning?—I have not mentioned the demand for India as one of the extraordinary demands, because I think that has been more or less a chronic demand extending over many years.

18,183. (*Mr. Everett.*) Would you mind informing the Commission what was, in round numbers, the extent of the extraordinary demands in Germany, the northern countries of Europe, the United States, Italy, and Austro-Hungary?—When I gave evidence before the Royal Commission in 1887, I put it at the round figure of 200 millions sterling, but that did not include Austria-Hungary which was not then moving.

18,184. (*Mr. Channing.*) The whole of them?—The whole of them.

Italy's demand for gold.

18,185. (*Mr. Everett.*) Did that include Italy?—That included Italy; I mentioned Italy specially. I may say with regard to Italy that the nominal demand that was talked of when the Italians issued the loan for the purposes of their currency was about 16 millions sterling, but as far as one can judge Italy has never been able to keep that sum, even if it took it, and Italy has not been responsible in any way for taking any gold out of the common markets of the world during the last 15 or 16 years. That is on the face of the figures. I put the extraordinary demands of that time—about 15

Mr. R. Giffen, C.B.
26 Apr. 1894.

or 16 years ago, when one was writing about it—as about 200 millions sterling, and I think as a matter of fact, apart from these military demands, from Russia and other countries in recent years, that that was about the figure at that time. That did not include India, because India was a case of a chronic demand.

18,186. Nor Austro-Hungary?—The demand for Austria had not then emerged, and was not then a demand that was in prospect.

Demand for gold in India and Russia.

18,187. (*Mr. Channing.*) What do you put the extraordinary demand for Russia and India at, in addition to the 200 millions?—The demand for Russia has been an extraordinary demand, but I do not think we can call the demand for India extraordinary, because it has been going on for the last 50 years or more. When I wrote in 1872 I found that the demand for India then had been about four millions sterling, and I think since that it may be put at about two-and-a-half millions sterling per annum.

18,188. (*Chairman.*) Is that an ordinary or an extraordinary demand?—I think it is an ordinary demand as far as India is concerned, that is to say, it is not an artificial demand in any way, but a demand by the people of India for the purposes of hoarding, which goes on with tolerable regularity from year to year.

18,189. (*Mr. Chaplin.*) Does not the adoption of the policy quite recently to endeavour to establish a gold standard in India point to an enormous extraordinary demand for gold for that country in the future?—I think it is quite premature to say that, until we see what steps are to be taken to bring about the gold standard in India. As far as things have gone at present, I do not think any demand of that kind has emerged yet.

18,190. (*Chairman.*) Then I gather from you that in your opinion the appreciation of gold during the last few years was largely due to the extraordinary demands?—To these extraordinary demands that I have referred to.

18,191. Either for war purposes or for restoring their gold currency?—The demands which I spoke of 15 or 16 years ago when I was writing—or 20 or 22 years ago—were demands chiefly for monetary purposes as far as one can judge, but during the last few years there have also been demands which do not appear to be demands for monetary use so much as military demands. At the present moment none of these demands seem to be very effective or very threatening, except the one thing which Mr. Chaplin has just mentioned, the demand for Austria, which I should be inclined to put to some extent in the category of the demand for Italy, which eventually came to nothing or came to very little.

18,192. It might have the same result?—It might have the same result as the demand for Italy.

18,193. Then looking to the immediate future would you say that as these extraordinary demands have ceased or are confined at all events to one country, and as the production of gold has largely increased of late years, you look forward with some confidence to the cessation of the movement, and possibly even a retrocession in the direction of the lower price of gold?—That is the idea; that the circumstances are different from what they were in 1872 when we were confronted by the fact of a steady diminution of the annual production of gold on the one side and various extraordinary demands for the use of gold on the other side.

Russia's accumulation of gold.

18,194. (*Mr. Chaplin.*) Will you please say how much gold Russia accumulated?—About 70 millions in the last 10 or 15 years.

Supply of gold from South Africa.

18,195. In satisfaction of her extraordinary demand?—I think that is about the amount that Russia has taken. Before we pass from this point I should like to mention the figures which I have before me as to the annual production of gold. They can be very simply stated. Of the annual production of about 20 millions of gold, which we used to consider about the normal figure 20 years ago or so, about six to six-and-a-half millions were contributed by the United States, about an equal amount was contributed by Australia and about four-and-a-half millions were contributed by Russia. There were smaller amounts coming from other parts of the world, not only from America, but to some extent from Europe and from China; very miscellaneous countries indeed contributed a certain amount. But these three localities, the United States, Australia and Russia contributed very nearly the whole of the 20 millions of annual production. The new factor within the last few years is that South Africa has already become a contributor of about five millions sterling, having contributed nothing at all six or seven years ago. According to the information I have from the city it is anticipated that South Africa will become in a very short time a still more important contributor. How long it will last in that capacity is uncertain, but some of the most expert people in the city have very strong opinions indeed as to the amount which South Africa is likely to contribute and likely to contribute with ease. This is quite apart I may mention from the last discovery in Australia, about which there is also a good deal of agitation, that is to say, the discovery in Western Australia.

18,196. (*Viscount Cobham.*) Are the figures from India considerable?—There is a certain amount from India, but that has been going on now for a good many years. Off and on we have had either something or the promise of something from India, and I am not aware that the promise of this particular moment is so exuberant as to be brought into comparison with what is actually coming and what is promised from South Africa.

Annual production of gold.

18,197. (*Chairman.*) What do you put the total amount now at?—The total amount now according to the last report of the Director of the Mint in America is close upon 28 millions sterling.

18,198. I suppose you would say that the addition of the 28 millions, and the fact of these extraordinary demands being satisfied for the moment would tend to show that there will be much less pressure in the future?—I think that seems to be the fair inference—that the pressure cannot be in the immediate future anything like what it was over that period, 1872 to 1887, which I have referred to. It seems to me that those figures which I gave as to the great influx of gold into this country during the last six years—as London is really the monetary centre of the world—seem to point to the same conclusion that the pressure is being eased off to some extent, and that gold is less in demand than it was.

18,199. (*Mr. Chaplin.*) The annual total addition that you anticipate now is 28 millions is it?—The annual production is 28 millions, but of course a very large part of that is used up at once, partly in the arts, and possibly in other ways—like the demand for India.

18,200. What I want to arrive at is this, the total annual output, as we will call it, you calculate will be 28 millions at the present time?—That is the last annual figure; I think in reality that it is going to be a little more, perhaps.

18,201. That would be an addition of how much to what we have been receiving during the last 20 years, say?—I think you may call it an addition of rather more than 25 per cent., between 25 per cent. and 30 per cent. I find that the average of the last 20 years comes to about 22 millions sterling.

18,202. So it is upon this additional six millions a year that you rely to a certain extent, in conjunction with other things, to restore the balance?—Six millions a year, with the prospect of increase.

18,203. (*Chairman.*) Your estimate, I presume, is subject to the unknown quantity of what the demand may be for India?—The demand for India has been comparatively steady, I think. Up to 1872 it came to about four millions sterling per annum for a great many years before that and since then it has been about 2½ or from 2½ to 3 millions sterling. It does not seem to be a demand which varies very greatly from year to year.

Consumption of gold in Africa.

18,204. (*Mr. Everett.*) Have you any means of knowing what gold goes into use in Africa where the new supply comes from; I remember reading two or three years ago that the consumption of gold there was more than the supply?—That was quite true. At first when the South African Gold Colonies were being formed, as it were, the effect was instead of bringing gold to this country rather to take gold from this country. The same thing I may say happened as far as one can tell in Australia in the early fifties and in California in the early fifties. But that is only a momentary and transitory effect and immediately when the gold mines come to work there is an efflux of gold from those places.

18,205. Have you at all a near idea of what the annual consumption of gold in the world is for the Arts?

Mr. R. Giffen, C.B.
26 Apr. 1894.

—I was always very sceptical about the consumption in the arts myself and threw out sceptical remarks at different times, but in 1887 when I gave evidence before the Gold and Silver Commission and looked into it a little carefully I was satisfied—quite satisfied—that the figure which Soetbeer gave—the great German authority—of about 13 millions sterling at that time as being consumed in the Arts in different countries was approximately correct and that he had gone into the evidence and taken actual evidence as to what was being done in England, in the United States, in France and in Germany which were the chief countries concerned. With regard to England, I may say that within the last few years I have been in communication with people whose evidence was laid before the Royal Commission in 1887 as to the consumption in the arts in England and I am quite satisfied of the correctness of the figure of about two millions sterling which was then given.

Annual consumption of gold for the Arts.

Currency and the fallen prices.

18,206. (*Chairman*). Having regard to all these facts are you opposed to any change in the standard of money?—I think with reference to some suggestions which have been made before this Commisssion—suggestions for an increase of the issue of the currency generally—that I should like to express my strong opinion that nothing which has happened in the fall of prices points to the necessity or the expediency of any change in our standard money; that that is a measure, in my opinion, which is one of the most serious in which a community like that of England can engage; that we have a money which is not only adapted to our own home requirements, but which is the basis of a very widely extended commerce, and upon which engagements and arrangements of every sort have been entered into; and that it would be very inexpedient indeed, as the result of any fall of prices which has taken place, and which is quite a thing which may be expected whatever standard money you have, that we should now begin to consider the question of a change in our standard money. The only thing I can suggest in these matters is that it is important to promote the full understanding of such movements as a general fall of prices, so that they can either be anticipated or prepared for by prudential precautions against something that cannot be anticipated.

Currency and perpetual obligations.

18,207. Then with regard to the obligations extending over a long period?—Some of the suggestions for a change in the standard money appear to have arisen because it is thought that the money which we have should not only be excellent for the primary purpose of an intermediary in transactions from day to day, which was the object with which money was spontaneously introduced, but that if possible you should have some form of money which would be suitable for engagements over a long period. Against any suggestion of that kind I should like to take the objection that it is not possible to find or invent any money by which engagements over a long period can be provided for, and in fact that there is no method by which beforehand you can provide automatically for the equitable fulfilment of such obligations.

18,208. The attempt has to a large extent failed even in the case of the tithe has it not?—In the case of the tithe, with regard to which I made a special inquiry some years ago, I think the attempt has failed. It was thought by fixing a produce rent, according to which the tithe was to fluctuate according to prices, you had got over all the difficulties in connexion with such a permanent charge as that. When I looked back to the discussions before 1836 I found that people were quite confident that by fixing a produce rent of that kind all questions of tithe becoming too burdensome upon agriculture, or disagreeably burdensome, were got over. The point was even put that a repeal of the Corn Acts was probably impending, and after that it was asked what the price of agricultural produce would be, to which the reply was given that that need not matter, because by providing that the tithe should fluctuate according to the prices of agricultural produce you had sufficiently provided for that difficulty. As a matter of fact it has been found by experience that the tithe, when settled in produce, in certain circumstances, becomes a much larger proportion of the rent of land than it was intended to be. For instance, suppose you had a rent of 50*l.* and a tithe of 5*l.*—10 per cent. of the rent—you assume that with a fall of 20 per cent. in the prices the tithe would fall in proportion to the rent, but that is not so, because a fall of 20 per cent. in prices may involve a fall of 40 or 50 per cent. in the rent, so that the rent instead of being 50*l.* becomes, say, 25*l.*, and the tithe fluctuating according to the prices of produce becomes 4*l.* instead of 5*l.*, but the 4*l.* in proportion to the 25*l.* is a much larger proportion than the 5*l.* in proportion to the 50*l.* So that this plan of fixing a permanent charge according to the fluctuations in the prices of produce has not answered and has not been successful, and I do not think that there is any possibility of any plan by which such permanent charges can be adjusted. When I wrote the paper in 1888, I suggested that this matter was so important that it should be looked into further. I thought then, and I think still, that in some respects changes in the permanent charges could be mitigated in some way by the application of processes of that kind. But I am also satisfied now that there is no perfect automatic process of any kind which you can suggest beforehand which will meet all the changes that are likely to happen with reference to a permanent charge.

Mr. R. Giffen, C.B.
26 Apr. 1894.

18,209. Do you go the length of saying that there is no satisfactory form of perpetual obligation?—I think so. I have looked into all the different forms that were suggested in 1836. Money was suggested; a particular commodity such as wheat was suggested; a group of commodities such as wheat, barley and oats, the method actually adopted, was suggested; a larger group of commodities, and finally a rating charge on the rental, were suggested. I am satisfied, whichever of these plans had been adopted in 1836, none of them would have been quite satisfactory working automatically as a permanent charge.

18,210. (*Mr. Chaplin.*) That is to say, no monetary system would work perfectly in that respect, but I suppose you admit that one monetary system may work better than another?—I am not quite sure. I think the difficulty as regards money is partly explained by what I have been saying about commodities and wages—that if you fix it in one way it answers, but then it will not answer the other way. Suppose you fix it in money; then if the purchasing power of money increases it is a very good thing for the people who have to receive the money, and may answer the purpose for which the permanent charge was created, but it may be a very bad thing for the people who have to pay the money. On the other hand, if the purchasing powers of money diminishes it is bad for the receiver if good for the payer. And the purchasing power may increase or diminish differently with reference to commodities from what it does with reference to labour.

Mortgages not a permanent charge.

18,211. (*Chairman.*) Mortgages are not in their essence permanent charges, are they?—Not in that way. I think the idea of looking upon a mortgage as a permanent charge is a wrong one, and that it ought really to be considered a charge which is subject to the modification of both the parties to the contract.

18,212. As a matter of fact, the landowners have derived some benefit from the reduction of the rate of interest upon mortgages?—That would be so, but I think it still more important that perhaps landowners have not been quite wide awake to the effect of giving mortgages extending over long periods, and they have had a lesson—no doubt a very severe lesson—which ought to be remembered. I think it is really one of the lessons of the period through which we have gone.

Rating charge on rental for tithe.

18,213. (*Mr. Lambert.*) Why in the case of tithe should there not be a rating charge on the rental? I should have thought that would have been fair?—But then the tithe might not answer the object for which the tithe was granted. You wish to create a certain endowment for a certain purpose, and if you make a rating charge upon the rental, and the rental diminishes enormously, the endowment is insufficient for the purpose for which it was created.

18,214. Then as regards the incidence upon the land itself——?—But you must look upon the thing from both sides. I might say that when I was investigating the question I was rather looking upon it from the side of the man who was to receive the tithe.

Reduction of interest on mortgages.

18,215. (*Chairman.*) As a matter of fact, has there been during the last few years a general reduction in the rate of interest on mortgages?—That is so. There has been a reduction in the rate of interest generally, and I have no doubt upon mortgages on good security in particular; I should say a reduction equal almost to from 5 to 3½ per cent., or something like that.

18,216. (*Mr. Chaplin.*) What evidence is there of that?—I speak of the evidence of insurance companies very much; what they have had to receive upon their

Mr. R. Giffen, C.B. 26 Apr. 1894.

insurance funds. If you look at the insurance companies' accounts, you find that they have had to submit to a very considerable reduction of interest upon the average upon their insurance funds during the last 20 years.

18,217. Upon their mortgages upon land?—And other securities—everything; I do not say mortgages in particular.

18,218. (*Chairman.*) I should have said, especially mortgages on land; there has been very much greater difficulty in getting 4 per cent., or even less than that, than there used to be, has there not?—I forget the figures at this moment, but at one time when I was writing on the subject I had some figures from the great insurance companies of Edinburgh, particularly as to their mortgages, and they showed a very considerable reduction indeed. That was about 10 years ago.

18,219. Of course we all know that the holders of Consols have had to submit to considerable reduction?—They have had to submit to considerable reduction.

Mr. R. Giffen, C.B. 27 Apr. 1894.

Interest on consols.

18,220. What is the per-centage of the reduction there, including that which is to come within a short period?—In my own time I remember Consols at 3 per cent. standing at about 90—that was about the normal price 20 years ago or so; now you have Consols at 2¾ with an eventual reduction of 2½ at par. I think the difference between the two things is fully half per cent., on about 3 per cent.

18,221. (*Mr. Chaplin.*) With regard to what you say as to the rate of interest on money lent by insurance offices having fallen upon land, is it not the case that various insurance offices have now passed regulations that they will not invest money upon land at all?—I was not aware of that. I was not speaking of the reduction of interest to insurance companies upon mortgages on land in particular; I was speaking of the reduction of interest on the investment of their insurance fund altogether, which would include securities as well as mortgages.

Adjourned till to-morrow at 12 o'clock.

Thirty-third Day.

Friday, 27th April 1894.

PRESENT:

THE RIGHT HON. GEORGE JOHN SHAW-LEFEVRE, M.P., IN THE CHAIR.

Viscount COBHAM.
The Right Hon. HENRY CHAPLIN, M.P.
Sir ROBERT NIGEL FITZHARDINGE KINGSCOTE, K.C.B.
ROBERT GIFFEN, Esq., C.B.
CHARLES ISAAC ELTON, Esq., Q.C.
Captain OWEN THOMAS.
FRANCIS ALLSTON CHANNING, Esq., M.P.
JOHN CLAY, Esq.
CORNELIUS NEALE DALTON, Esq., C.B.
ROBERT LACY EVERETT, Esq., M.P.
JOHN GILMOUR, Esq.
GEORGE LAMBERT, Esq., M.P.
WILLIAM CUTLACK LITTLE, Esq.
WALTER HUME LONG, Esq., M.P.
CHARLES WHITEHEAD, Esq., F.L.S.

HERBERT LYON, Esq., *Secretary.*
R. T. CRAWFORD, Esq., } *Assistant*
FREEMAN THOMAS, Esq., } *Secretaries.*

Mr. R. Giffen, C.B. 27 Apr. 1894.

Mr. ROBERT GIFFEN, C.B. (a member of the Commission), further examined.

Mr. R. Giffen, C.B. 27 Apr. 1894.

18,222. (*Chairman.*) Is there anything that you wish to be examined on in chief in addition to what you said yesterday?—There is one point I wish to mention, as I think it may be useful to give the figures at this stage. I was examined on the point before the Royal Commission on Gold and Silver, in 1887, and it was not a controversial point at all, but it was considered desirable that the figures should be stated. It is with reference to the actual consumption of silver during the last 20 years, that is, since 1873, as compared with the period before that. The point which I put then, and which I wish to continue now, is this, that after 1873, as a matter of fact, the consumption of silver in the civilised countries of Europe, and the United States, and in India, increased, and did not diminish as compared with the period just before that. With regard to the United States the consumption of silver arose especially in consequence of the Bland Act, as it was called, which was passed in 1878, and in consequence of the Silver Act of 1890, which was only abolished last year. In consequence of those two Acts (the first of them providing for a coinage of close upon five millions sterling per annum as the minimum, and the second providing for the purchase of silver against which paper was issued of between ten and eleven millions per annum), and in consequence also of the coinage of some token silver, the United States have now, in round figures, close upon a hundred millions sterling of silver—not a hundred millions sterling worth at present prices, but a hundred millions sterling, there or thereabouts, at the prices at which the silver was coined, or at which it was purchased at different times. This compares with the state of things prior to 1873, in which for many years the United States was not a consumer of silver for monetary purposes at all. The United States, after the outbreak of civil war in 1860, became a country of inconvertible paper, and practically there was no consumption of either gold or silver for coinage purposes in the United States for many years prior to the Act of 1878. Then the figures as regards France are as follows. Between 1860 and 1873 the excess of the imports of silver into France over the exports was 1,791,000 kilogrammes—I am giving the figures in quantities to avoid any questions of valuation. Then in the period 1874–92 inclusive, the excess of the imports of silver into France over the exports was 7,309,000 kilogrammes, so that the annual excess of imports of silver into France in the first period—from 1860 to 1873—was 128,000 kilogrammes, and in the second period it was 385,000 kilogrammes, showing a great increase of the excess of the imports of silver into France in the second period over the first.

Consumption of silver since 1873.

18,223. (*Mr. Chaplin.*) There was a large excess in the second period?—Yes; that is to say, after the year 1873.

18,224. What was done with it?—A large part of it seems to have gone into the Bank of France against which notes have been issued, but of course there is a

Consumption of silver in France.

Mr. R. Giffen, C.B.
27 Apr. 1894.

certain consumption of silver for the arts, in France, and possibly to some extent there may be a larger circulation of silver in the hands of the people, although I do not think so; as to the increase in the Bank of France I am quite certain.

18,225. Has any of it been coined?—Some of it has been coined.

18,226. Since 1874?—Since 1874, but what the particular dates of the coinage are I could not say. Then of course there is a certain amount of token silver in France, independent of the full legal tender silver.

18,227. (*Chairman.*) What does it represent in value?—At the present price of silver it may be taken at about 4*d.* the kilogramme, I think.

18,228. (*Mr. Chaplin.*) What would that represent altogether?—From 1874 to 1892, that would be from twenty-eight to thirty millions sterling, but of course there is a large part of that which would be in five franc pieces, and the nominal value therefore would be much greater.

18,229. What proportion of the twenty-eight to thirty millions sterling has been coined?—That I could not say.

18,230. (*Chairman.*) From 1874 to 1892 it would represent a much larger sum?—From 1874 to 1892 the amount is much larger annually than in the period from 1860–73.

18,231. (*Mr. Chaplin.*) In which period is the twenty-eight to thirty millions sterling—I did not quite follow?—From 1874 to 1892.

18,232. What proportion of this has been lodged in the Bank of France, and notes issued against it?—The Bank of France has, I believe, between fifty and sixty millions sterling of silver. What the increase has been exactly since 1874 I could not say, but a great part of it is, I think, since 1874.

18,233. You cannot say what proportion of this excess of import since 1874 has either been coined, or has any currency through notes?—I could not; I do not think it would be possible to say that very well. But I have not gone into that question at all.

18,234. (*Chairman.*) Then both France and the United States appear to have encumbered themselves with vast masses of silver?—They have taken much more silver since 1874 than they did in the period just before that.

18,235. And I suppose that mass of silver is not available for International exchange?—It is used in a certain way in the internal economy of both states. I believe, strictly speaking, it is wasted in both states, and might be very largely dispensed with without anything particular happening. But that is a monetary problem of some complexity which would take us a long way if we went into it. Then with regard to India, between 1860 and 1873 the excess of the imports of silver over the exports was 1,076 millions of rupees, and in 1874–92 the excess of the imports of silver over the exports was 1,545 millions of rupees. The annual excess in the period 1860–73 was 77 millions of rupees, and in the period 1874–92 it was 81 millions of rupees; so that India has been a larger consumer of silver since 1874 than it was in the period just before that, notwithstanding the very large exports of silver to India which took place in the Sixties, in consequence of the cotton famine.

Consumption of silver in India.

18,236. (*Mr. Chaplin.*) Of these imports can you say again what proportion has been coined in the two periods?—It is well known that the greater part of the silver which has gone to India has been coined, but I did not think for this purpose that it was worth while going into figures of that kind. I was merely stating in a general way what the absorption of silver had been in the different countries.

18,237. When you say it is well known that the greater part of it has been coined, what do you mean?—The publications of India show that.

18,238. Are you aware of the publication of a memorandum of the India Office, laid before Lord Herschel's Committee, which showed that there was an enormous preponderance supposed to be hoarded?—But hoarded after being coined, I believe.

18,239. No, not coined, but in uncoined silver; are you aware of that document?—Yes. I am not at all disputing the fact of your statement that there is a vast amount of hoarded silver uncoined, and coined as well; but of late years there is no doubt a comparatively close correspondence between the imports of silver into India and the coinage in India. To go on with the point I was taking, no other countries are so important in the matter as those which have been mentioned, and in some of the cases I have not been able to go back so far. In Italy I find that the excess of the imports of silver since 1878 (I cannot go back further than that) has been 357,000 kilogrammes; in Austria-Hungary, again, I find that the excess of the imports of silver since 1874 has been 355,000 kilogrammes; but in the 14 years ending 1873—1860–73—Austria-Hungary exported no less than 998,000 kilogrammes; so that it has been taking silver since 1874, whereas in the years immediately before that it was sending away silver. Germany is the one exception to the increase in the consumption of silver in the different countries that have been stated. The figure that I have got here, as the excess of the exports of silver from Germany over the imports between 1874 and 1892, is two million kilogrammes, but that would not include the silver which Germany sent away at the first beginning of the business, that is to say, in the years 1871 and 1872 and 1873 themselves.

Consumption of silver in Italy and Austro-Hungary.

Consumption of silver in Germany.

18,240. What again is that?—I think Germany parted altogether with about 26 millions sterling of silver in consequence of its change of money in 1872 and 1873.

18,241. 26 million kilogrammes?—26 millions sterling.

18,242. It is rather difficult to follow as we have other calculations in kilogrammes?—The two million kilogrammes depend of course on the value of silver, at recent values it would be about 8 millions sterling, but at former values it would be about 16 millions sterling, or nearly 16 millions sterling.

18,243. What would that represent at the old value?—I said 16 just now, but I think from 12 to 16 millions sterling.

18,244. (*Chairman.*) What deduction do you draw from these facts?—Merely this, that as a matter of fact in spite of monetary changes which have taken place in different countries, and which are often spoken of as the demonetisation of silver, yet the consumption of silver in those very countries has increased very much in the same period and has been very large. I should like in connexion with this, for the convenience of the Commission, to read a statement by Professor Lexis, who is an authority upon these matters. A statement of his is quoted in the last report of the director of the American Mint. He makes a comparatively long statement, but it will not take very long to read it. He says:

Professor Lexis on the consumption of silver.

"Undoubtedly the suspension of the coinage of silver "in several of the most important civilized states, "together with the German and Scandinavian sales, "contributed materially to the depression of the price of "that metal. It would not, however, have lost much of "its former value if its annual production had continued "at the same figure as at the beginning of the fifth "decade of this century. It still found in India and "China so great an outlet as a money metal that an "overloading of the European market with it could not, "on the supposition just made, have taken place. "During no former period has so much silver been "employed, even approximately, every year, in coinage, "or used in some other way (especially as a deposit "against paper money) for monetary purposes, as there "has been in the present. Leaving Mexico and the "South American States entirely out of consideration, "there were coined in Europe, the United States, and "India, in the years 1851 to 1860, an annual average "(at the old ratio) of $38,794,000. During the "decade 1861–1870 when the production of silver in "the West of the United States began to be developed "and when the cotton famine enormously increased "the payments due to India on account of international "trade, this annual average coinage amounted to "$80,020,000. But even this figure, which up to that "period had never been reached, is exceeded by the "average amount of coinage (Mexico and South America "not included) in the years 1887 to 1891, when the price "of silver had fallen as low as 43¼*d.* in London. The "average coinage of those years amounted to no less "than $113,000,000 (at the old ratio of value), and this "sum does not include the storage of silver bullion by "the United States. The known aggregate coinage "of silver during the sixteen years 1876-1891—that "is, during the period of the greatest depreciation "of the metal—amounted to $2,110,560,000. From "this we must deduct $71,000,000, which were re-"coined from old coins into German and Scandinavian "divisional coins, but this amount is off-set by the

"monetary silver bullion stock of the United States "created under the law of July 14, 1890. Moreover, "this sum embraces about $950,000,000 of Mexican "piastres, one half of which may have served as coinage "materials. The remainder went to China, or may "be considered the equivalent of the bar silver exported "to China, and which serves monetary purposes. The "net silver coinages, therefore, of this metal would "have to be put at, at least, $1,560,000,000. On the "other hand, the production of silver during the "same period, according to Soetbeer, amounted to "$2,109,394,000. Thus the net coinage was fully 74 "per cent. of the production, while the gross amount "of coinage shows that a quantity of silver as large "or even larger than that of the silver newly produced "passed through the mints. The coinage of silver, it "is true, has been suspended in France. It can no "longer be turned, for the convenience of holders, into "5-franc pieces, but in lieu thereof, it has found a "place in the currency of the United States to the "amount annually of $70,000,000—a sum six times "as great as the average annual coinage of France "during the time of silver's supremacy." The director of the mint puts a note here—"Prof. Lexis' estimate of "the net coinage of silver during the years 1876–1891 is "probably too large. He does not make sufficient "allowance for recoinages during that period. This, "however, does not materially impair the validity of his "argument." Then to go on with Professor Lexis again—"The heavy sales of silver by Germany ceased "14 years ago. The past coinages of the States that "stamped 5-franc silver pieces have been more than "counter-balanced by the coinages and storage of "silver by the United States. And still another cause "of the depreciation which the English Silver Com-"mission of 1876 called attention to, viz., the decrease "of the silver exports to India has not been operative "of late years. These facts make it evident that the "great cause of the depreciation of silver of late years "has been its increased production."

18,245. (*Mr. Whitehead.*) What would the dollar represent—about 4*s.*?—4*s.* 1½*d.*; but it is convenient always to call it 4*s.* if you are working these sums.

18,246. (*Chairman.*) I suppose there might have been even an increased demand for silver if it had not been for the monetary operations of the principal Powers in Europe?—That is, no doubt, a question for discussion, whether if the laws had actually been different the demand for silver would not have been still greater than it has been. But as far as the facts are actually concerned these facts are that the consumption of silver, notwithstanding that suspension of free coinage, of legal tender silver in France, has undoubtedly been much greater since 1874, than it was before that period.

The appreciation of gold.

18,247. I suppose you would conclude that the depreciation of the prices of produce has been due not to any action of silver but to the scarcity of gold? I do not think that the question of silver affects the matter very much at all. That is my own opinion, but in giving these facts I have been trying to do it so as to avoid any controversy of any kind and merely to bring out the facts.

18,248. But you admit that there has been an appreciation of gold of late years due to further demands upon gold?—An appreciation of gold as compared with the period just before 1873: it is purely a relative question, and I do not think that it should be spoken of absolutely in the way that is often done.

18,249. Is there anything else you wish to put before the Commission in your examination-in-chief?—No; that is all I wish to put before the Commission now.

Rents in 1842 and 1889 compared.

18,250. (*Mr. Chaplin.*) In your principal evidence you put in a table, No. XIII. (*see* Appendix , Table XIII.), in which you showed that rent was substantially the same in 1889 as it was in 1842?—That appears to be the effect of the table—the rent of land you mean?

18,251. Yes?—The figures are those of Schedule B.

18,252. Of course the fall has been much greater since then; are you able to put before the Commission any view of what it would be in 1894, the present year?—I should not like to put it in that way, because I think that is partly one of the things which we shall have to consider as a Commission from all the evidence that we have, and I am not prepared to express an opinion apart from that evidence, which is not quite concluded.

Mr. R. Giffen, C.B. 27 Apr. 1894.

18,253. 1842, I think, was before the great gold discoveries, was it not?—It was intermediate. There really had been discoveries of gold in Siberia, to which very great importance was attached at the time; relatively to the production of gold before that they were very important. But the Australian and Californian gold discoveries, of course, came some years later.

18,254. It was prior to what are generally known as the great gold discoveries in Australia and California?—That is so.

18,255. It was at a time, I think, when agriculture had not then fully recovered from the great depression which had existed earlier in the century?—I do not think I could quite express an opinion upon that point. I think agriculture had had several ups and downs between the earlier part of the century and 1842–1843

18,256. It is notorious, I think, that in the early part of the century agricultural distress was very extreme?—There were frequent complaints at different times, and many inquiries; that one does know.

18,257. Have you ever formed any estimate as to what was the cause of the depression at that time?—I have never gone into the question except in the most general way, but I should say that if you were to have a period of inflation, like what occurred at the beginning of the century, you would be likely to have a very long period of reaction afterwards.

18,258. That is the only view that you have formed of it?—I think that covers a great deal of ground. To some extent, I should say, the depression of the present time is due to the reaction from a long period of inflation which came to an end about 1874.

Rise in rents from 1842 to 1879.

18,259. Then after 1842—some years after that—there was a change in the position, and there began a rise of rents which, I think, was progressive for several years, was it not?—I could not say exactly when the rise of rents specially began, but I do not think the rise of rents was conspicuous—or very conspicuous—until about 1860, I should think. Perhaps you may have better information than I have.

18,260. Can you tell us when it reached its maximum?—It reached its maximum, as far as the Income Tax assessments go, about 1875 to 1879.

18,261. What was the maximum at that time?—I think the maximum of Schedule B. for England was about 51 millions sterling.

18,262. And now it has fallen back to ——?—41 millions sterling.

Fall in rents since 1879.

18,263. As estimated in 1888-89?—The figure in the table for England and Wales, I think, is 42,342,000*l.*, but in my notes I refer to a later figure which I find in the Inland Revenue returns. In the year ending the 5th April 1892, you get the figure under Schedule B. of 41,681,000*l.*

18,264. And this fall—from the maximum in 1879 did you say?—It was about that time; you had 51½ millions about that time.

18,265. This fall has reduced rents from the maximum of 1879 to something lower than the level that it was in 1842?—That is no doubt the effect of the figures.

18,266. But how much lower in the present year you are not in a position now to state?—Probably it is somewhat lower, but how much I could not say.

18,267. And this you point out has occurred in spite of the very large capital, which during all those years has been expended upon the land?—It appears from a great variety of evidence that the industry is one in which there has been a continuous expenditure of capital.

18,268. Are there any means of arriving at what the amount of that expenditure has been?—Whether we shall have some means before our proceedings are at an end, I am not sure. The difficulty is that we can very easily get special cases, but how far we can make up an average for the whole country from them, of course is a very difficult matter.

Proportion of rent to outlay of capital expenditure.

18,269. You are not in a position to give us any figures yourself which would enable us to arrive at a calculation as to what proportion the present diminished rent bears to the outlay which has been made of capital expenditure during these years?—No; it must take some gentleman who is acquainted with agriculture specially to do that I should think.

18,270. Would it represent, do you imagine, as much as the ordinary interest that may be expected from an

Mr. R. Giffen, C.B.
27 Apr. 1894.

investment of capital?—What rate of interest would you say?

18,271. Say 3 per cent.?—At 3 per cent. 40 millions of annual income would represent about 1,300 millions of capital, would it not?

18,272. Did you hear Mr. Pell's evidence which was given the other day?—Yes.

18,273. Mr. Pell, I think, contended that the rents of the present day, in his opinion, represented nothing but the interest on money invested in the land?—1,300 millions of capital divided by 50, the interval that has elapsed, would give you an expenditure of about 26 millions sterling per annum. Whether you have had such an expenditure in England per annum is more a question for agriculturists than for myself to determine; I should doubt if you have had quite so large an expenditure per annum upon improvements and new things in agriculture. That would represent, even at the highest assessment of Schedule B., half the gross rental, and I think that that is rather an excessive estimate.

18,274. If I remember aright, a good deal of the evidence before this Commission would point to the outlay of capital by the landlords as something approximating to that estimate?—I am not able to judge myself; I can only point out what the figures would imply if they were true.

18,275. Are you acquainted with the statements that were made last year in public by Lord Leicester with regard to the outlay upon his estate in Norfolk during the period of his own ownership and that of his father?—No, my attention was not called to those statements.

Fall in rents and general fall in prices and rise in labour.

18,276. You attribute this fall in rents to various causes; to a general fall in prices for one thing, and among others to the fact that, in your opinion, there has been a greatly increased remuneration of labour, I understand?—I do not think that I ascribed it to the general fall of prices; I think that I described it as part of the general fall of prices which was due in some measure to a contraction of gold, but I did not speak of the general fall of prices as the cause of the fall of prices in agriculture. I did refer to the improvement in the real condition of labour as one of the causes operating against rent.

18,277. I think you attributed the decrease in rents partially, at all events, to the fall in the prices of agricultural produce?—Undoubtedly, and that is one of the causes of the diminished money rents.

18,278. As part of the general fall in prices?—Yes.

18,279. Among other things you attribute this decrease in rents to the increased remuneration which is now being received by labour?—Undoubtedly.

Increased remuneration of labour.

18,280. What labour is that that you refer to—labour generally, or agricultural labour in particular?—Of course, as far as rents are concerned, it must be agricultural labour in particular.

18,281. I asked you, I remember, at the time that you made that statement, whether, even supposing you were right as regards the increased remuneration of labour, there had not been a considerable diminution of employment?—Not of employment generally, I think I said.

18,282. You said you saw no signs of pauperism, and there was no evidence that you were aware of, as to a decline of employment?—Employment generally I was speaking of.

18,283. That is the point I wanted to arrive at; in making that statement you did not refer to the agricultural labourers?—Not particularly, because, of course, as we all know, there has been a diminution in the number of agricultural labourers.

18,284. Then as far as the agricultural labourer is concerned this fall in prices has led to a considerable diminution of employment?—I do not think you can say so.

18,285. Does that not follow upon the answer that you gave me just now?—I think that is, perhaps, one of the points we have to discuss as members of this Commission, and I should not like merely to give personal opinions in the way that that would require me to do; but I do not think you can say that the fall in prices has led to the diminution of employment in agriculture altogether.

Diminution in agricultural employment.

18,286. You admit the fact of the diminution in agricultural employment?—Undoubtedly.

18,287. But you hesitate to attribute it to the fall of prices?—I think that it is quite conceivable that you might have had prices much better in agriculture than they have been, and yet the general state of circumstances would have been such that you would have had the same or nearly the same drift of labour from the agricultural districts to the towns as has taken place.

18,288. I am not able to follow that myself. Could you indicate by what means that would have come about?—Because if all prices were to rise equally—if money wages and everything were to rise equally—the relative position of the agricultural labourer would practically be just what it is now.

18,289. Is it not the fact that the diminution of agricultural labour is mainly owing to this other fact that there has been a great decrease in the acreage of arable cultivation?—That is no doubt one of the things.

Connexion between the decrease in arable acreage and fall in prices.

18,290. Would this decrease of the acreage of arable cultivation—I will not say be compatible with—but is there any reason to suppose that it would be followed by an increase of prices?—It might have followed with prices very different from what they are now if the wages of the agricultural labourer—the money wages—had gone up so as to give him the same real improvement in his condition that he has received.

18,291. But surely there is a connexion between the decreased acreage of arable cultivation and the fall in prices; there is a direct connexion, is there not?—But I am saying that the fall of prices must not be looked at by itself; it must be looked at in connexion with the relation between the prices and the wages paid for labour.

18,292. Quite so, but in connexion with whatever aspects you look at it, is there not that connexion between increased acreage and arable cultivation and the fall in prices; has not the one been the direct consequence of the other?—I think not. I should like to add in connexion with this that I remember quite distinctly a great deal of discussion and agitation 20 to 25 years ago about the difficulty of labour in agricultural districts owing to the rise of wages and the difficulty of getting the same amount of work out of the labourer. That was a thing which was operating to keep rents down, or perhaps even to prevent them rising as they would have done. There were undoubtedly discussions of that kind from 1869 down to 1874 and 1875.

18,293. Then do I understand you to mean this—that supposing prices were to remain at their former level there might still have been under circumstances that you can imagine a decrease in the acreage of arable cultivation and consequently a great diminution in the employment of agricultural labourers?—I think that the transformation of agriculture might have been very much the same as it has been with an entirely different scale of prices provided other prices had been adjusted to that scale.

18,294. That transformation that you refer to being a decrease in the acreage of arable cultivation?—Yes, I think so.

18,295. You think that might still have occurred, even if prices had not fallen in the way they have done?—I think that might still have occurred very largely.

Diminution of employment.

18,296. I cannot follow it myself. As regards other labour there you hold that there has been no diminution of employment. I understand?—No diminution taking the field of employment all round.

18,297. If that is so, how do you account for the constant cry of the unemployed which has been so prevalent during the last few years?—All I can say is that it is about 30 years or more since I began to write about these cries. They have always been going on all the time. I think it is very nearly 30 years ago since I heard discussions amongst people who were saying, "What is the good of low prices"—some prices were low at that time—"if you have no money to buy things with?" It is one of the oldest complaints that one hears, this complaint of the unemployed.

18,298. Do you remember a few years ago—seven or eight years ago, I think—that the fact of there being a vast number of unemployed in London led to such a serious state of things that special constables were sworn in for the protection of the interests of the community?—I recollect that perfectly well, and I also recollect many years before that, in 1868, a still more alarming condition of things.

18,299. We will go into both, but we will take the last period first, you recollect quite well that?—Yes, undoubtedly.

18,300. Is that quite compatible with the idea that there has been no diminution of employment?—Quite.

18,301. Perhaps you can explain how?—I do not think that much explanation is required. If one reads the history of these discussions you will find that there have been unemployed and riots from time to time all through the present century, and all one can say is that if you take a period like the last 15 years you will find that on the whole the riot and the disorder have been much less than they were at any time before.

Improvement in position of tenant farmers in last 20 years.

18,302. In addition to the increased remuneration of labour accounting to some extent for the fall in rent, you said possibly also the remuneration of the tenant farmer helped to account for it; do you mean to say that the position of the tenant is improved during these last few years, and that his remuneration is greater now than it was before?—I should say that in the last 20 years in some parts of the country the remuneration of the tenant farmer has increased; his scale of living has improved.

18,303. But if you think the remuneration of the farmer during these last few years has increased, do you disbelieve all the evidence that we have had before us as to their extremely depressed condition?—I am speaking of a somewhat different question, I think. It seems to me that one of the difficulties in the matter is that the tenant farmer as compared with 20 or 25 years ago finds himself unable to pay the same rent because in part his own scale of living has risen, and he expects to get more before he pays his rent. That is a very difficult thing to allow for in all these discussions.

18,304. I understood you to say that one of the explanations of this great fall in rent during these last few years—why it has reached the level of 40 years ago—was the fact that the tenant farmer had got increased remuneration?—I think if we refer to the discussions which have taken place, for instance, with reference to the case of the tenant farmer in Ireland you will find——

18,305. We are speaking now of England?—Undoubtedly, but this is an illustration of like causes producing like effects and we do attend to what is going on in Ireland. I think it comes out very clearly that one of the difficulties which have arisen in Ireland is that in spite of the great rise in the prices of produce which has been shown there down to about five or six years ago as compared with 1850 or thereabouts, yet still the tenants were unable—or professed themselves unable—to pay any more rent than they did. When you come to investigate that you find that the tenant expected to live much better before he paid any rent. I do know of cases in districts that I know about myself in Scotland in which undoubtedly you have had a similar improvement in the condition of the tenant farmers generally.

18,306. As Ireland is excluded altogether from the purview of this Commission could you give us an English illustration in support of the view that you have now advanced?—I think we have had illustrations in the evidence which has been given already. We have had one or two statements about the improvement in the condition of the tenant farmer—but not within the last few years.

18,307. Have we not had a great number of illustrations that proved exactly the opposite?—No doubt.

18,308. Is not the general drift of the evidence that we have had from the tenant farmers or the representatives of tenant farmers before this Commission that their position so far from showing increased remuneration has been infinitely worse during the last few years than it was formerly?—But I do not think we have had any very exact budgets from any tenant farmer, and this is one of those elements in the matter——

18,309. I asked you a very plain question—was that the drift of the evidence or was it not—of course you may not believe it?—I think this is hardly the time for me to discuss the evidence which we have had.

18,310. (*Chairman.*) I suppose you are speaking mainly of the smaller tenants?—The district in Scotland that I know best is a district of moderate farms—I mean Lanarkshire. I do know there—I have had several cases before me—of landlords unable to let the farms at any more rent than the rent of 20 or 25 years ago in spite of a considerable improvement in prices there because this is a place which is much favoured in the matter of prices of dairy produce. My friends, who had the letting of the farms, went into it with the farmers and found that the real difficulty was first that the labourer was better paid and better fed, and then that the tenant farmer himself expected to live better before he paid any rent; and these were the two things against the rent.

Mr. R. Giffen, C.B.
27 Apr. 1894.

18,311. (*Mr. Chaplin.*) In paragraph 30 of your proof you say, "As agricultural prices are not generally so "low as they were then, I attribute the effect on rent "very largely to the increase in the remuneration of "labour in the interval, and possibly the remunera-"tion of the tenant farmer"?—It is quite possible that the tenant farmer, in the prosperous years of the sixties and the beginning of the seventies, may have had his ideas of what his own share of the income ought to be very much raised, and now he is hardly sensible that he is claiming a larger return to himself before he pays rent.

18,312. (*Chairman.*) In that paragraph you are comparing the present with a very considerably remote time, 40 or 50 years ago; between that period and now there has been a considerable rise in the remuneration?—I think so.

Return to capital invested in agriculture.

18,313. (*Mr Chaplin.*) I will proceed to the next point. I think you stated that you attributed so much agitation in regard to this depression in agriculture compared with other trades to the fact of the enormous magnitude of capital invested in it; and you stated that there was no industry that you were aware of in which the return on capital has formed so large a proportion to the gross receipts; I think you went so far as to say that whereas in shipping 10 per cent. of the gross receipts may go to profit and loss, in agriculture it has been 60 per cent.?—I think I said 50.

18,314. Even 50 per cent.?—But then I explained that that included the profit of the tenant farmer as well as the rent.

18,315. Yes, but even admitting that, I should like to know how you arrive at figures anything approaching to it. Do you remember the evidence given by one of our principal witnesses, Mr. Clare Sewell Read, in which he said no profit would be made by a farmer on an arable farm until he had made at least six rents?—But what I should say would be that the larger part of the farming of the country now is not arable.

18,316. The larger part in acreage?—In acreage. I had in view the different kinds of farming, and not merely arable farming.

18,317. In what description of farming is the largest amount of capital embarked?—I am speaking of the capital embarked in the ownership, not so much in the cultivation.

18,318. Well, even in the case of ownership, surely there is more capital embarked in arable cultivation even by the owners than in other descriptions of farming?—I should think if you take the acreage all round and take the selling values the greater part of the value would not be represented by the arable cultivation.

18,319. How do you arrive at this estimate of anything like 50 per cent. as being the profit?—50 per cent. of the gross receipts goes to the tenant farmer and to the landowner together—I should think that that happens sometimes—and even more.

18,320. Are you leaving out of account the outlay?—No, I say the gross receipts.

18,321. The gross receipts?—Take, for instance, such a statement as one hears, that a farm must make three rents, one to the labourer, and one to the tenant farmer, and one to the owner: that would give the 60 per cent. at once to the tenant farmer and the owner. It is a common statement about agriculture. I do not attach much value to the 50 per cent. or the 60 per cent., because even 40 per cent. would be quite sufficient for any purpose that I have in hand. In comparison with other trades the 40 per cent. would be a very remarkable thing.

Fall in prices and foreign competition.

18,322. I will leave one of the practical farmers on this Commission to pursue this part of the examination. I think you said that in one sense foreign competition could be described as the cause of the fall in prices?—Undoubtedly foreign competition, looked at in one aspect, is the cause of the fall in prices, or rather is the cause of the fall in rents I should say.

Mr. R. Giffen, C.B.
27 Apr. 1894.

18,323. But at the same time you added that we might have had the same foreign competition without the same change that we have had in prices?—And producing a great many of the effects that it has.

18,324. It does not follow then that you trace the fall in prices in any considerable degree necessarily to foreign competition?—I think the changes in prices very often are a question of scale merely, and that such a cause as foreign competition would produce effects whatever the scale of prices may be. I think it depends upon the relation of prices to wages and other things.

18,325. Have you any evidence of your own or any information with regard to the condition of some of our foreign competitors—competitors for instance in wheat in the United States?—I have nothing of my own except what has been before the Commission—nothing specially of my own.

18,326. The evidence that we have had here on that point I suppose would confirm you in the view that there is some other cause for the fall of prices in addition to foreign competition?—I do not like to say in addition, because I think that foreign competition does not compete with the other causes of the changes of prices, and that the scale of prices is produced by the special relation of commodities to a particular article—gold.

18,327. You would say then that there has been some other cause apart from foreign competition?—I do not think foreign competition is a competing cause, that is what I would like to point out, but that foreign competition acting when prices go in a certain way produces one set of effects, and when prices go in another way it produces another set of effects.

18,328. Then I want to come to the question of appreciation which I understand you to say in your opinion is caused by contraction of money?—Contraction of gold in this case.

Contraction of gold owing to diminished production and increased demand.

18,329. This contraction is owing to what?—To a greatly increased demand for the article, gold, and at the time I commenced to write, 22 or 25 years ago, to a greatly diminished production, both changes as compared with the period just before.

18,330. Did you say where those increased demands have chiefly arisen?—The chief demand, when I wrote 22 years ago, with which we were occupied, was the demand for Germany in consequence of its change of money at that time.

18,331. Where else?—The other chief demand was the demand for the United States, which resumed specie payments in 1879 after having had inconvertible paper money from 1860.

18,332. Was this increased demand from Germany in consequence of the disuse of silver?—Partly; not altogether. To a certain extent the demand was occasioned by the abolition of small notes in Germany, and I do not think sufficient importance has been given to that particular change.

18,333. But if silver had not been disused in Germany, I suppose you would say that there would not then have been the same demand for gold that there has been?—There would not have been that particular demand for Germany; what would have arisen if that particular thing had not happened none can tell; there might have been some other demand, some other country might have thought of it, or something—we do not know.

18,334. There has been a great disuse of silver in other countries besides Germany, I think, has there not?—I do not think there has been much disuse even in Germany; the total amount of silver that Germany parted with was not so very large.

18,335. But so far as there has been a disuse for it, it was one of the causes of the increased demand for gold?—The change from silver to gold, of course, made some demand for gold.

18,336. If silver were to be used again to the same extent as before the strain on gold arising from that disuse in Germany I suppose to that extent gold would be relieved?—If it could be used to the same extent as before, as to which I should entertain a good many doubts.

18,337. Now, you told us that you were of opinion that we were on the eve of an increase in prices?—I think that that is a fair probability, looking at all the facts now in the same way that one looked at them in 1872, and at that time I anticipated rather a fall of prices.

Mr. R. Giffen, C.B.
27 Apr. 1894.

18,338. And you rather anticipate this—first, because you think the most pressing demands have been satisfied, and, secondly, because you anticipate an increased production?—I think I said that the most pressing demands of different kinds that have arisen during the last 20 years have been satisfied, and then I think I said that production already had begun to increase in a sensible manner, and that there were prospects of a further increase.

Production of gold beginning to increase.

18,339. I think you explained to us that the increase at present was something like 6½ millions a year, and that to that increase, with the prospect of more, you look for an improvement in prices?—Along with the cessation of the extraordinary demands for gold.

18,340. Now, upon that question of the extraordinary demands for gold I was not quite clear as to your views about Austria; is it not the case that there is a very large unsatisfied demand in Austria?—Not very large, I think, in comparison with demands which we had 20 years ago.

Extraordinary demands for gold in Europe.

18,341. You do not know what the demand is?—Looking at the general condition of Austria-Hungary, it cannot be a very large demand in comparison with those demands.

18,342. What was the demand of Germany, for instance?—Germany we found took 80 millions within a very few years.

18,343. Is there any reason to suppose that Austria would require very much less than Germany?—I think so; the economic condition is much inferior to that of Germany; the population is less; and they have a large amount of silver in use which they are not likely to part with. I do not think Austria-Hungary economically is at all in a position to be a consumer of gold like Germany.

18,344. But is not the demand for Austria-Hungary estimated at something like 60 millions?—I do not know who has made the estimate, but if it has been made it looks to me as if it was excessive. Of course, I think Italy is a case in point where the estimate was something like 16 millions sterling, and, as a matter of fact, you find after a few years that Italy has not got it.

18,345. In any case there remains the fact, does there not, that there is still an unsatisfied demand in Austria?—The unsatisfied demand I think is not 60 millions in any case, because I think a part of it has been satisfied.

18,346. What I was going to say to you is this: is it not the fact that there still remains a large unsatisfied demand in Austria, whether it be the estimate of 60 millions that I have suggested to you, or whether it be something less?—I do not think it is likely to be a very large demand.

Possible demand for gold in India.

18,347. Now with regard to India it is the case, I understand, that the policy has been adopted of endeavouring to establish a gold standard in India—that is so, is it not?—That I believe is the ultimate intention of the stoppage of the mints for the coinage of silver.

18,348. Can you form any estimate as to what the demands for that purpose for gold in India would be?—I find myself in a great difficulty in making any estimate, because the people who have promoted this gold standard for India have done it in the belief that very little gold would be necessary for the purpose. My own opinion is that to do the job in a proper manner, if it is to be done at all, you might have to provide a very considerable amount of gold; but I see at present no preparations of that kind, and my own opinion is that before the time comes the experiment will have to be given up. I should also go on to say that I do not think it is possible for India to have a gold standard.

18,349. I do not say this at all for the purpose of expressing any difference from you in the opinions you have just stated, but in order to pursue the argument I should like to ask, when you say that it would require a very considerable amount of gold to establish a gold standard in India, whether you can give us roughly any estimate of what that would be?—I am quite unable to do so, because I do not think the thing could be done at all.

18,350. What did you mean, then, when you said that it would require a very considerable amount; what had you in your mind?—I had in my mind the opinion of people who look at operations of that kind in a general way, and who would say, if it could be done at all, you

Mr. R. Giffen, C.B. 27 Apr. 1894.

would have to do such and such things; that is to say, you would have to take certain measures of precaution which would involve the accumulation of a certain stock of gold before you went into the operation. My own opinion is that you could not do it at all.

18,351. But if such a policy were feasible and were to be carried out, would it require as much, for instance, as Germany, or more?—I do not think it can be carried out, but I think that any people who were intending to carry it out in a proper manner would have to accumulate, not so much as 80 millions sterling, perhaps, but a very large sum.

18,352. A very large sum indeed?—If they were going to do it in a proper way; but there has been no suggestion, as far as I can see as yet, to do it in that manner, because the intention of the people is to do it without accumulating any gold.

18,353. If this policy should be persevered in, and as at the present it is a policy which we have actually before us, and if it takes so large a sum as you anticipate, that would destroy all your calculations as to an improvement in prices based upon an increased annual production of 6½ millions of gold, would it not?—Still in making these calculations you must form a judgment upon all these points, and my judgment is that, as a matter of fact, India is not likely to take any gold for any such purpose.

18,354. Your opinion clearly is that the policy of establishing a gold standard in India will fail, and that it will have ultimately to be abandoned; but I am suggesting to you that you must regard it at the present from the position of facts, and that you must have regard to the fact which we have before us that that is the present policy of the country; and if that policy is persevered in and carried out, then I want to know whether under those circumstances you would still anticipate this improvement in prices which you have led us to believe at present you think is likely to occur?—I think that question involves argument to a certain extent, if I may say so, because I do not think you have correctly described what the policy is. The policy of the Indian Government, as I understand, is to introduce a gold standard without accumulating gold, and I am not aware that it has ever been proposed to introduce a gold standard into India in the only proper way in my opinion in which it can be done. Then I am also of opinion that if it is attempted in the proper way it would still break down, and that we need be as little apprehensive of a gold standard in India as it has turned out we need have been apprehensive about what the Italians were doing some years ago.

18,355. In fact, you maintain that there is a proper and an improper way of doing it?—Undoubtedly

18,356. The proper way of doing it you hold to be impossible?—That is clearly my opinion.

18,357. The improper way of doing it you anticipate will end in the policy being abandoned?—I think it must be.

18,358. So far as you are concerned, although we are absolutely confronted with the policy, you have no apprehension from it?—Not the slightest.

Effect of changes of currency.

18,359. You hold out to us in paragraph 34 of your proof that it is "all important not to touch money"?—That is what I have said.

18,360. But surely money was touched, and very effectively touched, when silver was first demonetised, was it not?—But not by this country.

18,361. Quite so, but the effect has been equally disastrous in many respects, has it not?—I condemn a good many of the changes that were made by other governments, but one of the grounds for my doing so is a ground which would forbid any change by our own government; that is to say that governments should keep their hands off these things as much as possible.

18,362. But hands having once been laid on them, and the mischief having been done, still you are not prepared to sanction any proposals from your point of view which might have the effect to some extent of remedying that?—Because I think that any particular government in considering the question should rather see in what other governments have done, a reason for not meddling themselves, and that the important matter is to have a monetary standard which is independent of the government, and quite automatic.

18,363. In paragraph 42 you observe, "with a money "fluctuating as average commodities have actually "done, which is sometimes spoken of as stable-money, "the result would also have been much the same"; but is that not entirely inconsistent with what you say in paragraph 17?—No. I think paragraph 42 refers specially to paragraph 41.

Mr. R. Giffen, C.B. 27 Apr. 1894.

18,364. It does not refer to the question of mortgages?—No, but to the question as between tithe payer and tithe receiver.

Effect of increased purchasing powers of money on fixed charges.

18,365. In paragraph 17 you point out that "the "burden of mortgages and other charges would have "remained less than they have become by the increase "of the purchasing power of the money in which they "are expressed"?—There is no inconsistency I think; paragraph 42 refers to paragraph 41.

18,366. I wanted to clear that up. Then you also have said, "there is thus no satisfactory form of perpetual obligation"; upon that I asked you yesterday whether one monetary system might not be better than another; do I interpret your meaning in this statement rightly when I take it that you mean that there is no such thing as a perfectly stable standard?—There is no such thing—no such thing is conceivable even. I think it very important to call attention to the special thing about money in a progressive community—that by the necessity of the case if a community is progressive, a standard that is stable for one purpose, say for commodities, will not be stable for another purpose, say the price of labour.

18,367. But is it not the case that one standard may, at all events, be more stable than another?—No; the two things, the labour and commodities, are going different ways, and no standard can be stable for both; the thing is an impossibility.

18,368. I understand, at least I have reason to believe, that you deny the possibility of there being a double standard?—Absolutely.

Effect of a "double standard" monetary system.

18,369. But are you aware that a great many other people hold opposite opinions, and that it has frequently been contended that a double standard gives greater stability than a single standard? Are you acquainted with the views of Mr. Jevons on that subject?—I think I am very well acquainted with Mr. Jevons' views, and he was very much opposed to a double standard.

18,370. But did he not contend that the effect of having a double standard was that it remained much more stable?—I am not quite sure that Jevons' expressions on that point have been rightly interpreted; they are very complicated, and difficult to follow, and as far as they were perfectly expressed I am not quite sure that I would agree with them.

18,371. May I ask you to listen to the expression of one or two of his views upon this point; then I will ask you to explain in what respect you differ. Speaking of the standards Mr. Jevons' says this: "At any "moment the standard of value is doubtless one metal "or the other, and not both," and so far you agree with him?—That I agree with.

18,372. "Yet the fact that there is an alternation "tends to make each vary much less than it would "otherwise do," do you agree with that?—I do not agree with that at all.

18,373. "It cannot prevent both metals from falling "or rising in value compared with other commodities, "but it can throw variations of supply and demand "over a larger area instead of leaving each metal to "be affected merely by its own accidents." Now, if that were true it would have the effect of providing much greater stability than is provided by a gold standard?—I do not agree with that at all.

18,374. Can you explain why?—It does not seem to me to be a self-evident statement at all.

18,375. I will give you Mr. Jevons' illustration, which I own appears to me to be very apposite; perhaps you can explain it. He says: "Imagine two "reservoirs of water, each subject to independent "variations of supply and demand. In the absence of "any connecting pipe the level of the water in each "reservoir will be subject to its own fluctuations "only." That you would admit, I suppose?—That is true of water.

18,376. "But if we open a connexion the water in "both will assume a certain mean level, and the "effects of any excessive supply or demand will be "distributed over the whole area of both reservoirs." That you admit?—That is true of water.

Mr. R. Giffen, C.B.
27 Apr. 1894.

18,377. Then he goes on to say: "The mass of the "metals, gold and silver, circulating in Western "Europe in late years is exactly represented by the "water in these reservoirs"?—That I do not agree with in the slightest.

18,378. Will you explain why?—Because that is not the nature of the precious metals when used as money at all.

18,379. Did it not have that effect when both metals were used as a double standard?—I think not.

Level of prices in the bi-metallic period.

18,380. Was not the level of prices very much more stable than it has been since?—I think not; you had as great a change in prices between 1815 and 1830 as you have had of late years.

18,381. Between 1815 and 1830?—Yes, when you had both metals in use. The existence of two metals instead of one does not prevent the greatest fluctuations in the prices of commodities expressed in these metals.

18,382. I assume you do not deny what is known as the quantity theory?—I think that the quantity theory is so imperfectly expressed by many people, that you can hardly speak of it in that definite manner as the view which one person accepts or rejects. I found that expressing casually some kind of assent to it, I was held to assent to a great many things which I did not agree with at all; so I think if Mr. Chaplin does not mind he had better put his theory, whatever it is, in his own words.

18,383. During the time that the double standard was in use on the continent, prices for a great number of years remained practically stable, but since the disuse of the double standard there has been a great fall in prices?—I do not admit that first statement at all. I do not know any time in which prices were practically stable.

18,384. Do you not admit that there has been a great fall in prices since the abandonment of the double standard?—Since 1873 there has been a great fall of prices, but the double standard was abandoned in 1870.

18,385. No; in 1871?—In 1870 France became a country of inconvertible paper, and the double standard has not been operative in France since 1870.

18,386. Were not the mints open to free coinage until 1873?—You may say the mints were open to free coinage, and I suppose the mints of the United States were open to free coinage between 1860 and 1878, but what was the good of free coinage when the money was paper?

Period of bi-metallism in France.

18,387. Do you deny that France was bimetallic up to 1873?—Certainly; it was a country of inconvertible paper after 1870.

18,388. Would that be admitted by the French Government themselves?—Whether it is admitted or not, it is an absolute fact. My own recollection goes back to the time of writing about the premium of gold in France in 1871 and 1872. As well as I know anything I know that the premium existed then.

18,389. I understand that you admit that the mints in France were open till the year 1873?—Till 1874 really.

18,390. About that time?—With some limitations they were open even later.

18,391. And at the same time silver was legal tender money to any amount, was it not?—Silver coins were, but not silver.

18,392. Yes, silver coins. Does that not constitute a bimetallic currency?—There was bimetallic legislation, but I am speaking of the actual facts.

18,393. I am speaking of actual facts too?—You had no bimetallic system after 1870, because the money was inconvertible paper.

18,394. I repeat the question; were not the mints open to the free coinage of silver up to 1873, and was not silver coinage legal tender for debt to an unlimited extent, and do those things not constitute a bimetallic currency?—No, they do not constitute an actual bimetallic money in a country which has inconvertible paper. France was no more bimetallic after 1870 than the United States was from 1860 down to 1878.

18,395. Upon that point I must leave you, as you dispute what I understand to be an almost universally admitted fact, until we have the evidence of some gentlemen upon the other side of the question?—I should like to say upon that that I do not think that points of that kind have been sufficiently studied by a great many of the people who take up the subject. This is one of the things that really stare them in the face.

Mr. R. Giffen, C.B.
27 Apr. 1894.

18,396. I have no doubt we shall be able to receive the opinions of the gentlemen, who, at all events, may be credited with having sufficiently studied it, but whether they have mastered it is, of course, another thing?—That may be. Still, I am calling the attention of the Commission to a fact.

18,397. Do I understand you to say that the abandonment of this standard—a bimetallic standard as I call it, but what you dispute was a bimetallic standard—in France and the other countries in 1873 has had no effect at all upon the fall of prices?—My belief is that the abandonment was the consequence of a long series of events which must have taken place, and that if in France, for instance, they had attempted to go on with the bimetallic system after 1874 some other changes would have happened; but I believe the ratio between gold and silver would have been much what it is now, and gold prices would have fallen as they have done now.

18,398. I observe that you say in your very able book, which is called "The Case against Bimetallism"—on page 70 of that book—"It may be admitted that in the "actual circumstance of the world, if France had "continued to be bimetallic, probably some of the "mischiefs of the recent fall in prices would not have "been experienced"?—"Probably some"—that is a very hesitating opinion.

18,399. Then it had some effect, even in your view, according to your writings?—An effect of an uncertain amount and degree.

18,400. But it had some effect, at all events?—Apparently it would have some effect, but the question now is one of degree.

18,401. And according to that statement in your writings France was bimetallic?—It had a bimetallic law, but I think you will also find that I have mentioned at different times that bimetallism really came to an end in 1870, and not in 1873.

Coinage of silver in Europe since 1874.

18,402. You gave us some very interesting evidence this morning with regard to the great consumption of silver by the United States and European countries, which I understood you to say has not diminished since 1873. It is impossible for me to follow those figures accurately upon this occasion, but what I want to ask is this: I fancy I am right in saying that the mints of the European countries have been closed to the free coinage of silver since 1874?—Closed to the unlimited coinage of silver. I believe for some years afterwards they admitted a certain limited quantity.

18,403. Is it not the case that the Mint of France is absolutely closed altogether?—Now it is, but for some years after 1874 the exclusion, I think, was not quite absolute; I forget at what date it was made absolute.

18,404. It is absolute in the case now of the other countries, is it not?—I think so, but I think the matter was one of arrangement, and I could not say at what date the exclusion was made complete.

Coinage of silver in the United States.

18,405. Is it absolute also in the case of the United States—I think it is?—The United States have never been practically bimetallic in the same sense as France since they resumed specie payments. I think at the present moment there is no provision either for the coinage of legal tender silver or for the purchase of silver and the issue of paper against it, which was a method by which the United States used silver.

18,406. But at the present moment the mints in the United States are absolutely closed to free coinage?—I think that is the present position, but I never feel quite certain what the present position of things is in the United States until I inquire. That is always my difficulty.

Consumption of silver since 1873.

18,407. Then, there having been this immense excess of imports of silver into all these different countries, which you speak of as an infinitely greater consumption during the last 20 years since 1873 than was the consumption in the 20 years before that period, if all these mints are absolutely closed to its coinage what has become of it—what is the use of it?—That is a question for the future, and would require a good deal of consideration.

18,408. You are not able to throw any light upon that subject?—I should not like to give an opinion of that kind very hastily. The only thing that I could state

Mr. R. Giffen, C.B.
27 Apr. 1894.

to the Commission that would be of interest about it I think would be that as far as I can judge the best speculative opinion in the city at this moment is in favour of a rise in the value of silver from this point, but what the precise grounds of it are I could not explain minutely. I believe there is a great expectation of quantities of silver going to the East still, and some expectation of a stoppage of production in certain directions.

18,409. If the mints had been still open, and this vast quantity of silver had been coined in the same proportion that it was coined in the years before the mints were closed, would that have had any effect upon prices?—It does not follow that if the mints were open the silver would have been sent there to have been coined.

18,410. I said if it had been?—But there has been more coined, according to that statement I quoted from of Professor Lexis, of late years than there was in the time just before.

18,411. I elicited from you, I thought, in examination just now that all the mints have been closed to free coinage?—Now, within the last few years.

18,412. No, during the last 20 years?—No. I understood you to mean that they were closed now.

18,413. I am speaking of the European countries now?—I am afraid there has been some misunderstanding of your questions on my part.

18,414. I am afraid I shall have to ask them again: is it not the fact that the mints of France and of other European countries have been closed to the free coinage of silver for a great number of years?—To the free coinage of full legal tender silver?

18,415. Yes?—That is so.

18,416. Then what has this money been coined for?—Has it been coined, do you contend, in the European States?—The principal European State that I mentioned was France, and I do not think there has been much coinage in France in that period, but still the silver has been used.

18,417. Has there been any coinage in France except for the purposes of token money?—I should not like to say off-hand.

Gold and silver prices compared.

18,418. Then I will repeat the question: if in these countries where I now understand you to say the mints have been closed this silver had been coined, would that have had an effect upon prices?—I do not think it would have had any effect at all, because the prices have been gold prices all the way through.

18,419. You do not admit then, that there is such a thing as silver prices?—There are silver prices where silver is the standard.

18,420. And where silver has been the standard, that is proved I think to be much more stable than a gold standard?—It has been more stable with reference to the average of wholesale commodities in the last 20 years I think than gold has been.

18,421. When silver and gold were both legal tender during the reign of the bimetallic period do I understand you to say that the silver then had no effect upon prices?—Not except in the countries where silver practically was the standard. In some countries, I maintain under a bimetallic law silver had become practically the standard just as if they were silver standard countries; and of course in a country like that the prices would be silver prices.

18,422. Then the cessation of the coinage of a great quantity of silver has affected prices?—I do not see that that has any connexion with the answer I have just given.

Imports and coinage of silver in India compared.

18,423. It seems to me to be connected with it very distinctly. You told us something with regard to India. I think you said that the excess of silver imports into India between 1860 and 1873 had been 1,076 millions of rupees?—Yes.

18,424. And between 1874 and 1892 it had been 1,545 millions of rupees, and you stated in answer to a question of mine that it was well known that a great quantity of this silver, I think you said, was coined?—Was passed through the mints.

18,425. I referred from recollection to a memorandum laid before Lord Herschel's committee by Mr. F. C. Harrison, in which I find these statements: "Taking "everything into consideration, and calculating the "waste at ·06 per cent. annually, I am inclined to think "that the silver in India is about 510 crores of rupees." Then later on he goes on to say this: "In my first "memorandum I have estimated the silver in India to "be about 510 crores. Of this about 166½ crores is in "active circulation; 343½ crores remain to be accounted "for. Of this considerably less than 50 crores is "hoarded in the form of rupees. Roughly speaking, "it may be said that 300 crores may be held in India "in the form of bullion, obsolete coin, and ornaments." Now is that not rather an exactly opposite view to the one that you have put before us, namely, that this great mass of silver had gone through the mints?—I think the two things are quite consistent.

Mr. R. Giffen, C.B.
27 Apr. 1894.

18,426. Why?—It is quite possible that the mass of silver going to India of late years has passed through the mints, and it is also quite possible that the constitution of silver held in India at this moment is what Mr. Harrison describes. The two things are not at all inconsistent.

18,427. In what respect are they not inconsistent?—Because they bear upon different facts.

18,428. In one case you state that the great mass of these exports of silver to India is in the form of coined money?—I did not say that it is in the form of coined money at the present time; I said that it had passed through the mints.

18,429. You mean that it has passed through the mints and been melted again for hoards?—What happened after it passed through the mints I cannot tell, but it is a question of fact surely what the excess of imports of silver is, and what the coinage is, and these are things which can be ascertained.

18,430. What evidence is there to show that it has passed through the mints?—The evidence is that an equal amount has been coined in India in those years, or a nearly equal amount.

18,431. Where are the figures that show it?—If I had thought you were going to put the question I would have brought the statistical abstract for India, where the thing would have appeared at once.

18,432. This, mind you, which I have quoted from the Blue Book, is the official statement of the Indian Government?—But the statement is not in the least inconsistent with anything I have said.

18,433. I think it is extremely inconsistent. The statement gives the whole sum of silver in India as 500 crores. Of that it says that 300 at least are held in the form of bullion, obsolete coin, and ornaments. Unless on the supposition that they have passed through the mints and have all been melted, it seems to me that it is absolutely inconsistent?—Might I ask what is the use of putting a question of that kind when you have only got to turn to such a common document as the statistical abstract for India and you will see whether as a matter of fact the coinage of rupees has approximated to the excess of imports of silver into India? That is all I say.

18,434. I suppose it is for me to judge what use it is to put the question?—I do not see any inconsistency in what you have been quoting in the slightest degree.

18,435. If you do not see any inconsistency between this statement made in the official memorandum of the Government, and the statement which you have made, that it is well-known that the great quantity of this mass of silver imported into India is held in the form of coined silver?—But I did not say it was held in the form of coined silver. I said it went to the Mint and was coined, but as to what became of it afterwards I said nothing.

Imports of gold since 1858.

18,436. (*Viscount Cobham.*) Turning to your Table No. IX. (*see* Appendix , Table IX.), I suppose the causes of the movements of gold are very obscure, or could you throw any light upon the remarkable changes over different periods shown in that table. The first period, from 1858 to 1871, shows an excess of imports every year, except one, does it not?—Yes.

18,437. Then there was a very different state of things in the next 20 years?—That is so.

18,438. Is that explainable?—I think that it is explainable in the way that I suggested; that there was a much greater pressure of gold in these years after 1872 than there was in the years before. That is the only explanation—that there was not so much free gold about the world.

18,439. In a period of active trade in a country how would you expect the gold to move?—The peculiarity of this country is that almost all the gold produced

Mr. R. Giffen, C.B.
27 Apr. 1894.

seems to come to London for a market and is then distributed; and, of course, I cannot say that in times of good trade there is so very much more movement than at other times. The movements of gold depend upon a great variety of circumstances.

Effects of supply of gold on prices.

18,440. I think you found generally upon this table the conclusion that prices are likely to improve shortly; that is to say, that since 1888 there has been an accumulation in this country, and that it is likely to continue, and to cause a rise in prices?—That seems to be the indication. When gold tends to accumulate over a long series of years in a free market like London it means, on the whole, that there is not such a squeeze for it as there has been at other times.

18,441. Can you explain why the rise in prices has not, as a matter of fact, begun since 1888, but rather the contrary?—Experience seems to show that in a time of depression it takes a considerable time before the effect upon prices is produced. I am not at all changed in my opinion by the fact that as yet the effect of these things accumulating has not been produced.

18,442. Have you any other grounds besides the indications of this table for anticipating a rise in prices?—I think, generally, from what I hear as to the markets, that after you have had a time of depression in the prices of commodities, such as we have had, the effect is to diminish cultivation in certain directions, and that in that way also there is fair reason to expect a rise in the prices of agricultural produce specially.

Fall in rents.

18,443–7. I think you have stated it in your evidence, that the maximum amount of rent received in England was 51½ millions?—About that.

18,448. And that it has fallen to 41½ millions?—That is the amount of the assessment in Schedule B.

18,449. Do you think that that fairly well represents the actual facts?—Do you mean that the assessments might not be equal to the rent?

18,450. The fall of rent there shown is 20 per cent.; do you think that that fairly represents the actual fall in rents?—I should think that probably, judging from the evidence we have heard here, the average fall of rents has been more than that, that the assessments were never quite equal to the maximum rents, and that the assessments are not down now to the minimum.

18,451. There is a very great discrepancy, is there not, if our evidence is at all accurate; I think we have had evidence before us about the fall in rents being not less than 30 per cent.?—This, again, is involving a discussion of the evidence into which I do not quite like to venture; but I think we have had some cases of a fall of rents of not more than 15 per cent., perhaps, and cases like Cheshire, in which there has been very little fall.

18,452. Do you recollect the estimate which Sir James Caird made a few years ago?—Not very well.

18,453. Am I not right in thinking that it was an estimate of a fall of 30 per cent.?—He gave some evidence, I think, before the Commission on the Depression of Trade, but I was never able to follow it, and I did not follow it.

18,454. I think that is so; that he estimated seven or eight years ago that the fall there had been as much as 30 per cent.?—My experience is that general impressions of that kind are very apt to be corrected when you come to get actual statistics.

18,455. Sir James Caird was hardly a man to give general impressions only, was he?—I think by the necessity of the case he would be bound to do so in this instance. It would be an impression derived no doubt from great experience and from putting a great many things together, but it would not be actually a statistical computation for which he had not the means, I think.

18,456. You think, at all events, that the table of assessments is the best evidence that is accessible to us?—When we get it more complete perhaps, when we get a later year, it will give us a minimum view of the subject; we shall be quite sure, at least, that the change of rents has been that and probably more.

18,457. (*Chairman.*) Could we add to it what the assessments were at their highest, somewhere about 1876 or 1877?—I could give it for the whole of England and Wales, but I could not give it county by county, of course.

18,458. Not county by county?—No.

Mr. R. Giffen, C.B.
27 Apr. 1894.

18,459. Of course it would be very desirable to see it county by county?—I am afraid the only way to do that would be to get the Inland Revenue people to do it. I think it might be worth while for the secretary to put himself in communication with the Inland Revenue Department, and see what information can be got at different periods so that you might fix what to ask for. But I may tell you that they will have great difficulties in giving it county by county, unless they happen at some particular date to have done that, because the labour of getting that return was very excessive. (*See* Appendix .)

18,460. (*Viscount Cobham.*) The only explanation of the discrepancy would be that there must be a considerable amount of temporary remissions of rent?—But that they are fully acquainted with; where they have given an abatement of income tax in respect of a temporary abatement of rent they take a note of it.

18,461. But they would not know anything like the whole number?—I am afraid they could not know the whole amount of it.

18,462. (*Mr. Whitehead.*) I think the evidence you have given us applies to the general trade of the country as well as to agriculture?—As far as the general fall of prices is concerned.

Depression in agriculture and other trades compared.

18,463. May I ask whether other trades have suffered in the same degree as agriculture has in your opinion?—I think some trades have suffered quite as much. I refer especially to the iron trade and the shipbuilding trades at different times where the suffering has really been very great. Of course the amount of capital involved is much less.

18,464. Still there may be some trades that have not suffered equally, and some perhaps which have not suffered at all?—That is quite right. I think one may say that the retail trades of the country, the distributing trades, have not suffered nearly so much as the producing trades.

Depression abroad.

18,465. Might I ask whether the depression applies to all countries?—I think so. As far as agricultural countries are concerned, countries which are less manufacturing than we are, my impression is that the depression has been even greater generally in those countries than it has been with ourselves; I mean countries like the Argentine Republic, or countries like Australia, and like the west of the United States; the depression has been greater there even than it has been in this country, because the whole business there has been the production of agricultural produce and of raw materials.

18,466. Their depression applies only to agriculture, or rather more to agriculture?—We have not such a proportionately large business in the production of food and raw materials.

Relative fall in prices in manufactured articles and raw materials.

18,467. May I ask whether the expression you use in your syllabus "Commodities" expresses manufactured articles, products, and produce generally?—These tables to which the index numbers apply include manufactured articles to a very slight extent. In some of the papers which I have read and to which I referred, particularly the first paper of all, or the second, in 1872 or 1879, you will find a discussion of the relative fall in manufactured articles compared with the fall in raw materials and the relative rise in manufactured articles compared with the rise in raw materials. I think the general conclusion was that as the result of the depreciation of gold between 1848 and 1870 there was a much greater rise in the prices of raw materials than there was in the prices of manufactured articles then, from which I should infer now that the fall in the price of manufactured articles has probably been much greater than the fall in the prices of raw materials.

18,468. To raw materials would you add agricultural produce?—I would put agricultural produce very much with raw materials.

18,469. You say that agricultural produce has not suffered nearly so much as manufactured articles?—I think probably that in many manufactured articles you have had a much greater fall proportionately than you have had in agricultural produce.

Price of labour a main factor of depression.

18,470. Then according to the tenour of your evidence I think the Commission gathers that the price of labour is a main factor of the depression of trade in agriculture?—I think so.

18,471. You would say that the actual money wages are not higher, but that owing to the appreciation of

gold all articles of use, and especially of consumption, food, clothing, &c., are cheaper than they ever have been?—That is so at the present time, I think, or rather not than they ever have been, because if you go back to the Middle Ages I think you will find that prices were lower. But they are lower now than they have been for a very long period indeed.

18,472. Taking 50 years?—Taking 50 years.

Fall in wheat and other agricultural products compared.

18,473. Do you not think that the abnormal circumstances of wholesale wheat production in such soils as the virgin soils of the United States, Canada, and other countries have exercised abnormal influences upon British agriculture, and depressed prices irrespective of the appreciation of gold? That is to say, that there has been a special fall in agricultural prices?—Yes?

18,474. Yes?—That would be a very difficult question to go into, and I doubt whether you would find that there has been any special fall in agricultural prices except in the article of wheat, I think. I do not think you can say that there has been any fall in agricultural prices more than the fall in general prices, except perhaps in the article of wheat.

18,475. Has not all corn suffered equally with wheat?—Not equally.

18,476. You think it would apply only to wheat?—I think that is the only article that seems to show a very special depreciation of price.

18,477. (*Viscount Cobham.*) Has it fallen more than iron?—I think it has fallen more than iron.

18,478. (*Mr. Chaplin.*) Or cotton?—Not more than cotton, but then I am taking the average of other articles.

Effect of supply of gold on prices.

18,479. (*Mr. Whitehead.*) Do you think that any supply of gold would have obviated the depression caused by competition from foreign countries?—I think if the scale of prices had continued different from what it has been some of the effects of foreign competition which have been felt would not have been felt, and that you would not have had quite the same fall in rents as has taken place for instance.

18,480. Not in rents?—Not in rents.

Depression in England and other countries compared.

18,481. It is a strong argument in favour of your contention that in France and other countries where Protection holds, and where competition in corn has not been so great that the depression has been equal to that in England, for instance?—I think as far as one can judge the depression seems to have been quite as great in other countries as it has been in this country, but then that is not a point on which I have made any special examination.

18,482. Not as to the comparative depression?—Not as to the comparative degree of depression. That is one of the most difficult things to establish. Suppose you say that the depression in this country has amounted to, say, 10 per cent., you would say that we are 10 per cent. worse off than we were 20 years ago, or something of that kind; but how are you to say whether the depression in France has been 8 per cent. or 12 per cent., or some other figure? You cannot at all compare the degrees of depression exactly.

18,483. But you would hold that there has been great depression in all those countries?—There has been great depression.

18,484. Countries protected by Protection?—Quite as much where there is Protection as where there is not.

18,485. Therefore it may be argued that the depression is attributable to the appreciation of gold?—The fall of prices is attributable to the contraction of gold very largely, but how far depression goes beyond that is a different question. I think some of the depression must be attributable to that cause to which I have referred, and that is the labourer taking a larger share of the gross produce than he did before.

18,486. I was speaking then of the depression in agriculture only?—That would apply to agriculture specially.

Fall in prices of wheat and wool compared.

18,487. (*Mr. Clay.*) You said to Mr. Whitehead that wheat is the only produce of the farm that has fallen very greatly, I think?—That has conspicuously fallen more than the general average.

18,488. Take wool, which is a very important element in the making of a rent in a large proportion of hill farms, and even good arable farms; I think by your return it has fallen nearly a half?—I think I probably had in my mind that the fall in the case of wool was a fall from a very exceptional price.

18,489. It was not a very exceptional price in 1873, was it?—I know that there was an exceptional price for good wool after the cotton famine; when the change took place after that I could not say exactly.

18,490. It was a very exceptional price at the beginning of the cotton famine in 1864, when it rose suddenly up to 32*d.* per pack. Of course, you would think that exceptional?—That was exceptional, I should think.

18,491. But now you have it down to 11¼*d.* in 1893?—But how much was it in 1873?

18,492. Twenty-three?—That was also an exceptional price, I should think, for wool.

18,493. Twenty-three per pack; I do not know what is the English equivalent?—I think my impression was as I have said. I did not pay so much attention to wool in that way, because I considered that the price in 1873 was rather exceptional, and I do not think you can say that the price of wheat in 1873, or at that time was very much above the average of what it had been.

18,494. You know in our country, in Scotland generally, that the wool is a very important element as a rent-payer, and therefore, coming down by one-half is a very serious matter to hill farms?—Still, it is not so important an article of agricultural produce generally—not nearly so important as beef or articles of that kind.

18,495. Is that your experience?—Taking the production of the agriculture of this country generally.

18,496. I am talking just now about hill farming?—Of course, what is true of all agriculture might not be true of some particular forms of it.

18,497. If two-thirds of the rent were paid by wool when it comes down to one-half, that would make the two-thirds into a very small proportion?—That would be so.

18,498. Mr. Chaplin put some questions to you about rent; you seem to hold the old idea, which perhaps is not a bad one, that three rents are required out of the land?—I took that as a common mode of speech about it.

18,499. When you heard Mr. Clare Sewell Read saying that you would require six rents nowadays, did you agree with him?—I did not go into it minutely at all. I did not examine Mr. Read about it, but that is quite possible at the present moment, and yet it may not have been the case 20 years ago, which was the time at which we began.

Effect on rent of increased cost of living of tenant farmer and labourer.

18,500. Is not the cause of the fall of rent in one way which he pointed out the increased cost of living of the farmer, and the increased cost of living of the labourer, and the demand for higher wages, have those two things not gone a great deal towards lowering the rent of land?—That was one of the points which I put, and I put it that that is a thing which would have affected the real rent of the land, whatever the money prices of the labour had been. If the labourer and the tenant farmer have for their living the equivalent of so much more of the produce than they used to get, that will go against the rent.

18,501. Indeed in the social scale goes just now, the labourer thinks he must have more of the produce of the farm than he has had before?—That is so, I believe, and that would affect the rent whatever the scale of prices be, if the labourer got a greater share of the produce.

18,502. So whatever scale of prices there is, the living of the tenant and the increased demands of the labourer for wage and living and dressing, are more by 30 per cent. than they were 20 or 30 years ago?—I should not have put it so high as 30 per cent., but I should have said 20 per cent.; possibly in many parts of the country it is as much as you say.

18,503. Do you see any chance of the demand for these things being decreased?—I think the general tendency of the times is rather to maintain and to improve the condition of the labourer.

18,504. That the labourer and the tenant farmer are entitled to more of the produce of the soil than they have had in the past?—I do not say entitled, but I say that they are likely to have it.

Comparison of total amount of rent at different periods.

18,505–6. You have given us a comparison between the rental of all the counties of England and Wales in 1842–43, and in 1888–89; do you know whether there are any figures available for an intermediate period?—I could not say; I think it is just possible there may be, county by county, if you look at the decennial reports of the Inland Revenue Department, but I could not say for certain that you would find it there.

18,507. I suppose—we have had it in fact in evidence—that any comparison of the total amount would show that there was a continuous increase in the amount up to about 1879 or 1880?—Yes, to 1879 or thereabouts.

18,508. 1880, I think, was the highest point for England?—I think so, but that, of course, represents more the actual rental of two or three years before that than the rental at the moment.

18,509. It is based upon triennial assessments, is it not?—Yes.

18,510. And when a new assessment is made there may be a change?—Yes.

18,511. The figures that you have given are based on Schedule B., I understand?—Yes.

18,512. That is gross rent?—I believe so.

18,513. Which includes besides tithe all the outgoings on land such as we have in our part of the country for arterial drainage?—I could not say myself precisely what it includes.

11,514. Perhaps you will take it from me that it does?—I do know as a matter of fact that the Inland Revenue Department, when they were getting the information together, were most careful to inquire and to put the two returns as far as possible on exactly the same footing, so that the one return included what the other included. I know that their attention was given to the points that you mention of that kind.

18,515. The point I wish to make is this, that being a gross rent and including as it does in the case of Cambridgeshire and other counties, the very large sum which is paid for arterial drainage, if that drainage has increased since 1842 the net sum to the landlord must have decreased by that amount?—That would be so.

18,516. Supposing the totals to be equal now and then?—That would be so.

18,517. If a million of money has been spent—and I think I might venture to say a million of money has been spent—in the county of Cambridgeshire on arterial drainage since 1842 and the rent is still the same, then the interest on that it is shown by these figures is entirely lost?—That would be so.

Method of assessments under Schedules A. and B.

18,518. Have you any practical acquaintance with the method by which Schedule B. is assessed?—No, I am not acquainted with it practically.

18,519. Perhaps you know that it is very largely based upon parochial assessments?—I believe Schedule A. is also based upon parochial assessments.

18,520. Schedule A. is the foundation for Schedule B., and in the absence of any return and in the case where a man is occupying his own land the value must be estimated?—I could not say of my own knowledge—that follows from the nature of things.

18,521. It is clear that where the rent is not paid or where the rent is not ascertained, you must resort to a principle of estimation?—That would be so.

18,522. From my experience the parochial assessment is the basis of assessment in all such cases, now are you aware that previous to the Union Chargeability Act the practice in all parishes was to keep down the assessment as much as possible?—I could not say that that was the practice.

18,523. You can understand that when every parish was a law to itself, and made its own assessment for parochial and union purposes, they were anxious to keep down the amount which might be used against them for county and Imperial purposes?—I could not say of my own knowledge how far that would extend in practice, but for Imperial purposes that would not affect them, I think, before 1842–43, because you had no income tax till then.

18,524. No, not before 1842–43, but I am speaking of before 1865. Up to 1865 there was a direct inducement to keep down the parochial assessment, and was not the effect of the Union Chargeability Act in raising the parochial assessments felt distinctly in the raising of the assessment for the income tax—was there not a very considerable rise after that?—There was a very considerable rise after that, but then I am bound to say that you had a very considerable rise in Schedule D. and other items of the income tax that were not subject to that; so that what the special effect of that was I would find it very difficult to say.

Mr. R. Giffen, C.B.
27 Apr. 1894.

18,525. Do you know or do you think that it could be ascertained what proportion of the assessments under Schedule A. and Schedule B. are made by estimation, and what proportion upon actual returns?—I doubt even whether the Inland Revenue Department could tell you that without a good deal of inquiry of the particular officers who do it.

18,526. Would you be surprised to know that in some parts of the country at least, as to which I can speak, a very large number of estimations have to be made, and that no returns are made?—I know that is the case with the income tax very generally in England, but not so much in Scotland, I think.

18,527. That is very generally the case in England?—Yes.

18,528. And where no return is made and when rents are exceptionally high is it not extremely probable that the estimate of the rent would be below the actual rent?—My own impression is that for a good many years the tendency of the income tax people has been to draw the reins a little tighter, if possible, and that the effect of that upon the two years 1842–43 and 1888–89 would be that in 1842–43 probably the figures that you have are much more under the mark for the time than the figures you have got now, and that the effect would be that the change in rent between 1842–43 and the present time has been greater than this return shows. I think that that is an inference that would be quite well justified.

18,529. You are aware, are you not, that a very large number of people have no interest in these returns being correct since they do not pay income tax, and that consequently an assessment may go unchallenged for many years because no one has any interest in disproving it?—I do not know how far that would affect Schedule B. if you look at it as the dependency of Schedule A., because although a particular farmer paying under Schedule B. might not have an income subject to income tax the owner's income, as he has more properties than one, might still be subject to income tax, and he would have a motive in seeing at least that he was not over-assessed.

18,530. A great many owners have not 150*l.* a year which make them payers of income tax?—I do not think the deductions of that kind, as far as one can judge from the Inland Revenue returns, are very serious—the deductions from Schedule A. I mean. The deductions from Schedule B. are very large indeed.

18,531. I will take another case where a man is a nominal owner and has a large mortgage; the object is to get at the mortgagee; the owner proves that he has not the 150*l.* a year because he has to pay so much interest on the mortgage; the Surveyor of Taxes finds out what the interest on the mortgage is and he says: You must pay income tax on this interest whether the land is worth it or not, because you can get it again?—Yes, that would be so.

18,532. That is another source of error and over estimation in bad times, is it not?—That would be the tendency, but to what degree it would operate of course would be the important question statistically.

Proportion of profit and loss to gross receipts in agriculture and other industries compared.

18,533. Now, I should like to ask you about Paragraph 21, where you say: "Whereas in shipping 10 "per cent. of the gross receipts may go to profit and "loss, in agriculture it has been 50 per cent. and upwards." May I ask what deductions you make from the gross receipts before estimating your sum for profit and loss?—That, of course, would depend upon the kind of agriculture.

18,534. And the nature of the expenses; what would this 50 per cent. and upwards, to put it the other way, cover?—It would cover the tenant farmer's income and the landowner's rent.

18,535. And nothing else?—The remainder would be for labour, and for the things that were purchased for the farms—manures, and things of that kind.

18,536. You are using the term profit and loss account in the sense of a trade account, I presume, as in making up a company's account?—In the sense in

Mr. R. Giffen, C.B.
27 Apr. 1894.

which it would be used in the shipping trade; for instance, where you take the gross income of the ship and you find that the amount that would go to profit and loss would be 10 per cent. of the gross income say, but there would be wages, and the other things to go out of the gross income.

18,537. I suppose in a trader's account of that kind you would allow a salary for the manager?—That would be so.

18,538. But in the profit and loss account for the farmer you are allowing nothing for the salary of the manager?—That applies to a great many things in Schedule D. as well. The profit there of a man in trade includes the earnings that he would have if he were employed as manager. It is well known that the profit includes also the salary of superintendence.

18,539. Could you show by any series of accounts that anything like 50 per cent. of the produce is divisible between the landlord and tenant in addition to a salary which the farmer might be entitled to as the manager?—I would not say in addition to the salary.

18,540. Inclusive?—That would be inclusive.

18,541. And you think, at the present time, that 50 per cent. of the produce is divisible between the landlord and the tenant?—I would not say so much at the present time as that, it is the thing which has been.

18,542. In some former time. I do not know whether you are familiar with some farm accounts which I obtained when I was under the Richmond Commission, and which I reduced to per-centages?—I do not recollect them at this moment.

18,543. I have taken out this morning seven instances of these accounts which extend over a period of years. I have left out all those that were for one year only, and I find that on the average of those seven examples the landlord and the tithe owner, and the rate collector, and the tax gatherer, got 33 per cent., which is very near to the old idea of one-third, only that third does not go to the landlord alone but it goes to the landlord, the tithe owner, the rate collector, and the tax collector, and only 9 per cent. of the proceeds went to the farmer; that brings it up to 42 per cent., which is very much less than the 50 per cent.?—I should like almost to ask you the question whether that 9 per cent. included everything that the farmer got. I should like before we pass on from this to say that I had very much in my mind, as something analogous to agriculture in the proportion of capital, the railways. We do know that the working expenses of railways range from 50 to 55 per cent., and that the amount that goes to profit and loss is from 45 to 50 per cent. It occupied my mind a good deal to explain why it was in agriculture there was so much suffering, and in railways you had no outcry to speak of by comparison. I believe the chief difference is that railways have been a progressive industry and agriculture has not been progressive.

18,544. You remember Dr. Fream gave us some accounts for three periods of seven years, and that I drew his attention to a great change which had taken place in the three periods?—Yes, that was so.

18,545. I found from those accounts that in the first seven years 47 per cent. was available for the landlord and tenant, in the second 31 per cent., and in the last period of seven years only 14 per cent.; so that would not show anything like the per-centage you name of the produce?—47 per cent. is very near 50 per cent. I consider it practically the same thing.

18,546. For the first seven years in the 21?—I was speaking of the beginning of the period—of how it was then.

18,547. You do not think that is applicable now, do you?—That would not be so applicable now.

18,548. You say that the labourer has got a larger share of the produce than he had; that an economic revolution has transferred a proportion of the produce which was enjoyed by the landlord and tenant to the labourer?—I think that is undoubted.

Increased remuneration of labourer.

18,549. And ultimately that must come out of the rent?—I think so.

18,550. Unless a greater amount of produce can be grown?—Unless you can grow a greater amount of net produce.

18,551. That would rather point to this: that where the labourer is also the owner and the farmer, he should have a chance of succeeding?—What he loses as an owner he gains as a labourer?

18,552. Yes?—That would be so.

Mr. R. Giffen, C.B.
27 Apr. 1894.

Position of occupying owners.

18,553. That would tend to show that the occupying owner who tilled the land with his own hands would have a better chance of success than any other class?—Under certain conditions.

18,554. And he would have this advantage that the fall of prices would not affect him in so far as it related to produce that he consumed?—I think also it would have this disadvantage that if he only got the same income as he got before, suppose he gets it now as a labourer instead of getting it as an owner, relatively his position would be changed for the worse with regard to other labourers, and he would feel that a little.

18,555. In so far as he became the owner, the occupier, and the labourer he would not suffer from that transfer of produce from one to the other which has occurred?—He would suffer from the relative change in his position in the way that I explain.

18,556. Do you mean that he would be in a worse position than the labourer?—He would be in a worse position relatively; he would not be so superior to the ordinary labourer as he was before.

18,557. I am speaking of the labourer who becomes an owner and an occupier; his position relatively would be as good as before, would it not?—I do not think he would have so much to gain by becoming an owner under the new conditions.

Revision of basis of Tithe Commutation.

18,558. (*Mr. Dalton.*) I think you said that you had made a special inquiry as to the principles on which the Tithe Commutation Act was arranged?—Yes, some two or three years ago I had to do that.

18,559. And you came to the conclusion that there was no satisfactory form of perpetual obligation?—I looked into the different methods that were suggested then, and what the probable results would have been if they had been adopted, and I came to the conclusion that none of them were quite so satisfactory as the authors of them seemed to think they would be.

18,560. And you would have thought it a prudent thing at that time if the tithe commutation had been made subject to revision after a certain number of years?—I think that would have been a most important thing to do, but that was a thing which was overlooked when it was settled; they seemed to be so confident that the settlement once made was so well made that it would last for all time. It was made upon the assumption that agriculture was going to improve very much, and that the tithe would be a continually diminishing proportion both of the gross produce and of the rent. These things in effect have not happened.

18,561. The exact opposite has happened practically?—The opposite has happened, and the tithe now is, I do not say a larger share of the gross produce, but it is a larger share of the net produce than it was in 1836.

18,562. Do you think the hardship is so great as to justify a re-opening of the tithe question?—I think that the facts are of a kind to show that it would have been desirable in the tithe settlement of 1836 to provide for a revision of it after a great many years had passed, and I think the circumstances are also such that if they would not quite justify they would certainly excuse a re-opening of the tithe settlement and an adjustment with reference to modern conditions altogether.

18,563. In some cases it would be to the benefit both of the tithe owner and of the landowner if that was done?—I think in some cases where the tithe has become a very large proportion of the rent, say a half or more than half, it is highly desirable that the thing should be put on a proper footing, and that the landowner should have a larger real interest in his property then he has.

18,564. Do the same considerations to some extent affect the land tax?—They might affect it the same in principle, but not to the same degree, as the land tax is a much smaller thing altogether.

Fall in prices due to contraction of gold.

18,565. (*Mr. Lambert.*) To what do you attribute the fall in agricultural prices?—Chiefly to the same causes that have produced the fall in general prices.

18,566. What would they be?—The contraction of money relatively to what went before. That is the difference between the last 20 years and the 20 years before.

18,567. Had it nothing to do with foreign competition?—I do not think foreign competition, to use rather a

Mr. R. Giffen, C.B.
27 Apr. 1894.

technical phrase, is on the same plane with changes in prices. I believe that foreign competition would affect us whatever the scale of prices might be.

Increase in purchasing power of money.

18,568. How much do you think the purchasing power of money has increased in the last 20 years?—That depends entirely upon what you measure it by. If you measure it by the average wholesale commodities that are dealt with in these index numbers, I think that 25 per cent. to 30 per cent. would be the measure, but if you were to take a day's labour for the measure you might say that the purchasing power of money is exactly what it was. It depends entirely upon the measure that you take.

18,569. Then presuming that rents have decreased 25 per cent., the purchasing power of those rents, with the exception of labour, would be as great as it was 20 years ago?—That is, assuming that rents have decreased 25 per cent., but the evidence seems to be that the reduction of rents is rather greater than the general fall of prices; and that would follow, because the reduction of prices would fall upon the gross produce, and as the rent is the margin, it would have much more effect proportionately upon the rent than it has upon the gross produce.

Possibility of an international agreement on currency.

18,570. (*Mr. Channing.*) You expressed a very strong opinion as to the failure in arriving at a gold standard in India. I suppose I may infer from that that your opinion is that, at any rate for a long time, we shall be in the position of having gold standard countries and silver standard countries?—I think that is quite unavoidable in the present circumstances of the world.

18,571. Do you think that that will have as its natural result a tendency to arrive at some agreement between nations as to the relative value of the two standards used in one set of countries and in the other?—I think not, because that is not a matter about which nations can make effective agreements at all. It rests on daily business, and whatever governments may agree to the market will go its own way.

18,572. Do you not think the tendency of business might produce a pressure upon Governments to take that course?—I do not think that there is any experience to show that Governments can regulate the prices at which the two commodities will exchange for each other.

18,573. You would not support any policy of mitigating the evils of change which seem to be inevitable from having gold standard countries and silver standard countries trading with each other?—I do not think Governments can do anything to mitigate the difficulties of exchange which they had better let alone.

Movements in prices of commodities.

18,574. (*Mr. Everett.*) First. I would like to ask you some question in regard to your tables, and I will begin with Table II. which deals with the index numbers of the movement of prices. (*See* Appendix, Table II.). If you had gone back five years further you would have started with a higher figure, would you not, and if you had continued it down to the present time your lowest figure would have been much lower than your present lowest figure?—You mean if I had gone back further?

18,575. If you had gone back to 1863, for instance. I have here before me, I may say, the "Economist" index numbers and the number which you give as 2,750 for the average of the years 1868-77 is 3,400, 3,700, 3,500, 3,500 and 3,000 in the five years previous?—That might be so, but if you had taken a period of 10 years before 1868, I am not quite sure that you would have got a higher figure to begin with than you have got there; at any rate it is highly desirable in these matters, and in comparisons of that kind rather to take long periods if you can.

18,576. Then generally on the index numbers I would ask you this question—they show, do they not, that from the time of the gold discoveries there was a considerable upward movement in prices, and that from the time of the change in monetary legislation there set in a downward fall in prices which has continued right down to the present time?—I think that is the effect of the evidence which I gave, but with this difference, that the fall of prices was more marked about 12 or 13 years ago than it has been since. As far as I can judge the greater part of the fall occurred in the first part of the period.

18,577. I should be correct when I say that had you carried your first figure five years backwarder, that is, if you had started with 1863, your first figure, 2,750, would have been a higher figure, and if you had continued the list down to the present time your 2,300 would have been near 2,000?—The latest figure that I gave is 2,170 I think it would have been somewhat lower if we had taken the present time actually, but how far the insertion of one or two years in the average and the taking out of one or two would have made much difference I could not say without a careful examination.

Mr. R. Giffen, C.B.
27 Apr. 1894.

18,578. But your figures do not show the whole of the movement which has taken place as between the level of a few years at the highest prices and the level at the present time?—The figures are more average figures than extremes undoubtedly.

Income tax per head of population.

18,579. Then we come to Table No. IV. which shows the annual yield of the income tax per head of the population. (*See* Appendix , Table IV.). Your figures there show that the income tax per head of the population had a progressive yield down to 1879, and that in the 10 years following 1879 the movement was retrograde or stationary; that is the general teaching of these figures?—That is the effect.

18,580. Then we come to Table No. VII. which deals with the wages of agricultural labourers. (*See* Appendix , Table VII.). Now you wrote, I believe, in 1888 a paper on "Prices and Incomes Compared"?—Yes, that was so.

Wages of agricultural labourers.

18,581. I have here before me on page 26 of the printed essay this statement: "Major Craigie's conclusion is that at the present time"—this was 1888—"as compared with 10 years ago, the drop in that part "of the labourers' wage paid in money from 18 to "20 per cent. in the east and in the west of England "about 12 per cent." When I compare that with the figures that you lay before us here, certainly the two facts do not appear to be square one with the other; the figures you have given us do not show a movement for the whole, corresponding with that which you here say was the conclusion Major Craigie arrived at?—I have just looked at one or two of the eastern counties and I do not know but what there is a fair correspondence if you allow for the different years. But in any case I was bound to give these figures as I got them from the more recent information that we have. At the same time I must also admit that Major Craigie is a very careful inquirer, and, no doubt, had chapter and verse for the particular statements which he made.

18,582. (*Mr. Little.*) You put in a note that the latest returns only refer to particular districts as a rule and not to a county average?—Yes. For instance, let us take Essex. In 1880-81 the rates given are 12*s.* to 13*s.*; in 1892 they are 11*s.* to 12*s.*, roughly speaking that is a fall of 10 per cent. It may not be quite so much as Major Craigie puts it, but it is in the same direction. There is not such a wide difference in the results.

18,583. You have noted that some of these returns of wages in 1893 refer only to particular districts, they all refer to selected districts and not to counties, do they not?—Not to the average of the whole county. That would be another explanation of the differences.

18,584. (*Mr. Everett.*) If you were able to give the figures of the wages being paid to-day you would have to show, as regards agricultural wages, a still lower figure than these tables show, would you not?—That depends, again, upon the evidence which has been brought before us. I think in a good many cases we have had statements made that there has not been any great reduction of late years—in one or two cases we have had statements that there has been, but how to make an average of all these will be rather difficult.

18,585. I happen to know that in Suffolk and Essex wages have gone down, on a great many farms, 2*s.* in his present year as compared with last year. Then, while we are on the subject of agricultural labour and labour generally, you have been questioned as to whether the fall in prices has affected employment, and you seemed disposed to think that the employment for labour had not been much less than it was in the times of the higher prices?—I speak of the employment for labour generally throughout the country.

Diminution of employment of labour.

18,586. Are you aware that a Commission was appointed in 1886 to inquire into the depression of trade and industry, and that in one of their reports they say that trade and industry are depressed, and that by this depression is meant a diminution and in some cases an absence of profit, with a corresponding diminution of employment for the labouring classes, that this dates from about 1875 and has proceeded with short intervals with tolerable uniformity. That would seem to show that in the opinion of that Royal Commission employ-

Mr. R. Giffen, C.B.
27 Apr. 1894.

ment had diminished?—I do not know whether that is the opinion of the Commission or not, but I should say if that opinion was expressed by them it was not at all supported by the evidence.

18,587. (*Mr. Chaplin.*) Do you mean the evidence given before that Commission?—Yes.

18,588. Have you read the evidence?—I have read the evidence—the greater part of it—some of it very carefully, and I am quite satisfied that in that form it is not at all exact.

18,589. (*Mr. Everett.*) You were asked about the cry of the unemployed, can you not remember the time when every available man was wanted in industry?—That has been so at different times. I recollect very well in 1872 and 1873 there was no possibility of getting labour in many industries where labourers were wanted, but you had much the same thing again in 1883, and you had much the same thing again in 1890 and 1891. There are always these fluctuations in trade, and you must be very careful when you compare two periods to find out whether the one period is a period of inflation and the other period is a period of depression. What you ought to compare always is one inflated period with another inflated period, and one period of depression with another period of depression, and then you compare like with like.

Imports of gold.

18,590. Then we pass to Table IX. (*see* Appendix , Table IX.), in which you show the excess of imports of gold into the United Kingdom over the exports. I observe that if instead of taking the division of years which you take we take the first 21 years terminating in 1878, that would show an annual excess of import into England in those years of over 4,000,000*l.*, and then the next ten years down to 1888 show an annual loss of about 908,000*l.*, which brings out perhaps even more strikingly than the table divided as you have divided it the great difference in the amount of gold that was in England in the different periods?—That would be so, but I think it is very important in these matters that you should have natural divisions to a large extent. The reason why you have this division at 1871 is that I began this table when I was writing in 1872, and it was at that point that I formed the opinion that circumstances were likely to change and that prices were likely to fall. Of course when I use the table afterwards to compare with my own opinion I am bound to take all the subsequent facts and not merely to make a selection of such as you are suggesting now. But even taking it quite fairly as I have done, and without any ulterior design, for I put the figures down to 1871, because I was writing in 1872, I think the facts are quite strong enough in the tables as they stand.

18,591. I may say that in my question I have no ulterior object other than to have the facts before us in their actual state. If you take the 21 years beginning with 1858 they show that on the average of those years we have had yearly an excess of gold of 4,000,000*l.* coming into this country, and in the following ten years, instead of an annual increase, we had an annual deficiency of 908,000*l.*?—I think you would also find if you were treating it in this manner that the first period then would include a period of part of those extraordinary gold demands, of which we have heard, and that you had that great increase going on in spite of one of the most important of those extraordinary demands. Then you would throw the whole effect of the pressure upon gold upon the demand which came after that, that is to say, upon the American demand simply.

Ratio between silver and gold.

18,592. Now we will pass to Table X. (*see* Appendix , Table X.), in which you show the ratio that has prevailed between silver and gold from the year 1501 down to the present time. I observe that the effect of the figures given there is to show that the ratio varied less in all the previous centuries taken together than it has done in the period since the monetary changes which began in 1872 or 1873 were initiated; that is so, is it not?—That is the history; but I think it also shows that there have been other times at which considerable changes took place as well as the most recent period.

18,593. Your figures, I imagine, have a substantial accuracy?—There is no doubt that the figures down to the present century are based mainly upon the Mint indentures of different countries; that is to say, the ratios which were established by the Mints; but we do not know that those were the market prices; the market prices may have changed much more.

18,594. You may know perhaps that the weighing of ancient coins of gold and silver, which circulated in Palestine, Phœnicia, Egypt, Persia, and Greece, show that a ratio was preserved in those coins between silver and gold for many hundred years B.C. of something like 1 to 12½ and 1 to 13?—I did not know that myself. I have not gone into that.

Mr. R. Giffen, C.B.
27 Apr. 1894.

18,595. I have a letter of Max Müller's before me in which he refers to the authorities on which this is established?—I should have great doubts about the inferences where the facts are so few and where we know so little of what actually happened in the dealing with these coins.

18,596. You would I think be disposed to admit frankly this; that we have seen in the last 20 years a much wider divergence between the two metals than has been witnessed in the whole period of recorded history?—I do not know. I happen to know of a much greater divergence which took place no doubt in a small corner of the world merely, but quite within my own recollection and quite before these 20 years; that was in Japan. When Japan was thrown open to commerce the ratio between silver and gold in Japan was 4 to 1, or something like that, and a very great commotion arose before the adjustment was made to the ratio between silver and gold throughout the world. That shows I think that the ratio was not so universal or so well established as Mr. Everett seems to think. There may have been many more exceptions than we know of.

18,597. Would that not also show that in a country where intercourse with the outside world was forbidden, the power of the Government to fix and preserve the ratio in that country was enormous?—But I am not aware that this was the ratio fixed by the Government at all. This was the practical ratio of the market so far as I know.

18,598. But you do not know that it was not fixed by the Government?—I do not know sufficient about it.

18,599. Of course if it was the ratio which prevailed in the country the taxes would be collected in that ratio and the Government sanction would be behind it?—What the monetary arrangements of the Government were and what they sanctioned I could not say; but that was the prevailing ratio and the moment it came in contact with the ratio prevailing elsewhere of course it disappeared.

Value of agricultural production in 1874 and 1891 compared.

18,600. Then in Tables XI. and XII. you show the annual loss on the money value of the agricultural production of the United Kingdom as between 1874 and 1891 (*see* Appendix , Tables XI., XII.)?—What the change would be, assuming the quantities of 1874 to be the same as the quantities of 1891. Of course that is an assumption, because we know that the cultivation was not the same at the two dates and it is only an assumption made for the convenience of bringing out what the average change in prices has been.

18,601. But such difference as would arise from that source would be in the direction of increasing still wider the divergence, would it not?—That is my impression that the nature of agriculture in 1874 was such that the gross produce would be more relatively to the net produce than it is now.

18,602. Even taking the figures as you show them you show an annual loss in the money value of the agricultural production of the United Kingdom of over 76,000,000*l.* a year?—About 25 per cent. it comes to, I think.

18,603. Which is not far short, I think, of the whole revenue raised by taxation in this country leaving out the Post Office?—Not far short.

18,604. And that relates simply to the annual value of the produce, saying nothing about the capital value of the land which produces the produce?—That is only the annual value of the produce.

18,605. If you take the fall in the value of agricultural land besides, you would be landed on the whole, would you not, in a loss very nearly equal to the whole amount of the National Debt?—But I do not admit that this is a loss in that sense of the word; it is a transfer from one pocket to another. Somebody else gets the article cheaper in consequence of the difference in price.

18,606. But the owners of agricultural land and the cultivators of agricultural land have suffered this loss?—It makes a difference to them, undoubtedly, but we must not speak of it as a loss to the community.

18,607. It is nearly approaching in amount to the whole of the National Debt?—You must not speak of it as a loss to the community, and I infer from your speaking

Mr. R. Giffen, C.B. 7 Apr. 1894.

of the National Debt you are speaking of it as a loss to the community.

18,608. (*Mr. Lambert.*) Could you give us an estimate of what would be the loss to the agricultural community, taking into consideration the cheaper cost of the products that agriculturists have to buy?—I do not think I could put it in that way very easily; that would require a very elaborate computation, and this does not profess to be a very exact or elaborate statement at all. That would be a very difficult thing to do.

18,609. (*Mr. Elton.*) You would have to add the labourers' profit in buying cheaper food, too?—Yes.

18,610. (*Mr. Everett.*) Then coming to Table XII. (*see* Appendix , Table XII.), you have told us that the figures in that table showing the alteration in the annual assessment of land are based on Schedule B. I do not know whether you are aware that in my county, which, probably, is a fair sample, Suffolk, a great many farmers still pay under Schedule B. even where they have no income at all, because they do not keep accounts; so that Schedule B. does not fairly, I take it, represent the actual facts?—I think we may consider that at the present time the assessments shown here are much more than the rental paid.

Demand for gold since 1872.

18,611. Now, turning again to your very able and interesting essay on "Price and Incomes Compared," which you read in 1888, you tell us there that you predicted in 1873 that an era of falling prices was about to begin, and that you based that on the new demands for gold which were then foreseen; were those new demands known at the time. I think it was 1872 you said?—In 1872 we were quite certain about the German demand which actually had commenced. It commenced in 1871.

Demand for gold in the United States.

18,612. But you were not then aware, were you, of the demand that would arise in the United States?—The question of the resumption of specie payments in the United States had begun to be considered at that time, and we also assumed then that the resumption of specie payments would be in gold as the United States had practically been a gold country when they were not an inconvertible paper country. Upon that footing it was foreseen that there would probably be a very great demand for gold for the United States as they had parted with an immense quantity during the time of the Civil War. They parted with the whole stock when the war commenced, and then they distributed over the world about 6,000,000*l.* to 7,000,000*l.* annually all during the war. Therefore we assumed that when that came to an end and specie payments were resumed the United States would make a very considerable demand for gold, as it afterwards did.

18,613. You were not aware that legislation was likely to take place in the United States; you had no inkling of that?—Yes, I was aware of that a little. I did not mention it, I see, in the paper, but I was quite aware of it in 1873, when the legislation did take place. It was a well known thing and very much discussed.

18,614. You are aware that until 1873 the Mint in the United States was equally open to gold and silver, and that both were equally legal tender?—No doubt the United States was in law a bi-metallic country all during the Civil War, and had been for many years before that, but practically it was a gold-using country just as England was, and the exchanges went on upon that footing.

18,615. That was simply because the ratio at their mint was rather a different one to the ratio in France, was it not?—The ratio was 16 to 1, and that seemed to be sufficient to give them gold. It had been so effective that, in order to obtain the silver money for small change which was really required, they resorted to the expedient of coining silver as token money about the year 1850, so as to give them what silver they really required upon that footing.

18,616. If they had not changed their law in 1873, when they resumed cash payments, they would have resumed them on the basis of the two metals, would they not?—What would have happened in that case of course it is somewhat difficult to follow out, but the legislation of 1873 was quite deliberate, and quite in view of the return to specie payments.

18,617. Are you aware that after the President had signed the law which changed their standard from a joint standard to a single gold standard he was unaware of the provisions contained in the statute?—That is quite possible, and yet it may be quite true that the statute was deliberately passed and was fully explained to all the people who happened to take an interest in it at the moment. That is quite within my own knowledge.

Mr. R. Giffen, C.B. 27 Apr. 1894.

18,618. Are you aware also that that is stoutly denied in the Legislature of the United States?—But it is no use denying it to anybody like myself, who knows the discussions of the time. I may give you as an instance that in the latter part of 1873, or in the early part of 1874, a very long letter appeared in the "Economist" from Mr. Frederick Hendricks, who is one of the ablest students of monetary matters that we have. In that letter he gives a full explanation of the United States legislation, and the objects of it, and sets out all the different enactments necessary to the understanding of it. The thing was not done in a corner at all, but everybody who cared to know, and who was interested in it, knew exactly what was being done.

18,619. You do not include the President in that?—It is quite possible that the President, who was a man much occupied with other matters, had not given his mind to it. I have no doubt sufficient explanations were put before him, but if he did not give his mind to it he might not recollect.

18,620. As soon as the American people found out what really had been done, did not there arise a great agitation in America?—I think the proper way would be to say, as soon as certain people, who were bimetallists, found out what was done, and as soon as the agitation of Mr. Cernuschi began to make itself felt generally, an agitation was stirred up resulting in the Bland Act of 1878. But that is all you can say. There was no general indignation amongst the American people, and there could not be because comparatively few understood anything about it.

18,621. I am afraid that belongs to monetary legislation generally. The key to a great deal that has happened is that the common people do not understand it and that the owners of money do. Turning from that for a moment, you still, I gather from your evidence to-day, quite adhere to the opinions which you have very emphatically stated in this Essay on the Movement of Prices and Wages, that "the recent "change from a high to a low level of prices is due to "a change in money of the nature or in the direction "of absolute contraction;" and again, "the inference "seems conclusive, therefore, that after 1873, the "alteration in the economic movement was in money, "and to this must be ascribed the change of prices "which has occurred?"—I think that is a fair statement of what happened after 1873.

Changes in prices of commodities due to contraction of money.

18,622. And, again, "to put the matter into more "popular language, we might, perhaps, say that the "stationary or rather rising commodities between 1850 "and 1873, although commodities were increasing as "much as they have done since 1873, were maintained "by the continual additions to the stock and efficiency "of money. Since 1873 the movement of additions to "the stock which was a very pronounced one has been "arrested, if there has not been an actual withdrawal "from or diminution of stock uncompensated by an "increase in the efficiency of money. Consequently the "fall of prices since 1873 is explained by the check to "the previous movement when the matter is looked at "dynamically, and the periods are compared?"—I should like to say that if I was expressing that now, I should probably express it somewhat differently, and make it more clear, that when I speak of money I mean gold, the commodity which is the standard in which our prices are expressed; that there was greater pressure upon gold, the commodity, after 1873 than there was before then; and I should carefully avoid saying anything to imply that there was a difference in the currency of the two periods. I think it is very important to explain that, after the controversies which have been going on for some years.

18,623. You speak of standard when you speak of what affects price?—When I am speaking of things of that kind I am speaking of standard exclusively, and it does not follow that what is true of standard would be true of currency, which is sometimes spoken of as money.

18,624. You adhere probably to what you also stated in that same essay, that this change in the value of money "spells ruin to considerable classes" in the country?—At the time when it takes place it is very serious undoubtedly.

Mr. R. Giffen, C.B.
27 Apr. 1894.

18,625. And especially to the indebted classes and producing classes?—Yes; from my point of view the change took place a good many years ago, that is the greater part of it, and it has not been true of the state of trade during the last 10 or 12 years.

18,626. Is it not true that there has been wholesale ruin among the indebted classes and among the producing classes?—Not so much from the contraction of money in the last few years as in the period from 1872 to 1880. I think it is very important to keep in mind that these things produce the mischievous effects mainly at the very moment of transition, and that when once the transition is over, so far as the general trade is concerned, it does not very much matter what the scale of prices is.

18,627. I was speaking more particularly of agriculture with which this Commission deals; the agricultural ruin has been going on year by year as the change in the prices has been increasing, has it not?—In some agricultural prices that would be the case.

18,628. But speaking of them as a whole?—I think it would be very important to inquire what the different stages in the fall of agricultural prices in particular have been; I think there have been various ups and downs in prices since 1879.

18,629. On the whole the figures show that the movement has been downwards since 1879, do they not?—Not uniformly, not regularly, I think.

18,630. I know that, but as a whole?—I think this again is bringing up the discussion of evidence which has been before us. I think the evidence has been that for some years agriculture went on fairly well till a new turn of prices happened about two years ago.

18,631. You would not wish to run back from your statement that the change in prices caused by the alteration in the value of money "spelt ruin to classes"?—It spelt ruin to a good many people undoubtedly. There is no doubt of that.

18,632. Events have confirmed what you then anticipated?—Yes. How far people could have prevented it, knowing what was going to happen, I am not quite sure; but I think it would have affected a good many transactions if people had quite realised what was coming. My own impression is that many people in the City were better prepared for what happened than people in agricultural districts, or people who were not so familiar with these discussions.

18,633. And perhaps a good many agricultural people were ignorant of what was really being done, and of what would follow from it?—I should think very few knew anything. But I do not admit that it would not have been a right thing for the Americans to do what they did, even if they had foreseen a good many of the effects. It was better that they should have good money than that they should submit to all the inconveniences from which they had been suffering for a good many years before.

18,634. You say it was desirable that they should have good money; do you not recognise silver as being good money?—For myself I should have thought they would have done well, probably, if they had gone over to a silver standard instead of a gold standard, but that was for them to choose. It was important that they should have either the one or the other, and have good money.

Silver and gold as standard of commodities compared.

18,635. In this most able and interesting essay I notice that you point out that silver has proved itself a much more stable standard as measured by commodities than gold has?—As regards wholesale commodities. It is quite evident that silver has moved with the average of wholesale commodities much more closely than gold has done.

18,636. And during the most of the last 20 years, prices in countries where silver is the standard, instead of falling, have, if anything, moved a little up?—But that does not show that silver would have been a better standard for a country like England, that is a totally different question, because probably if we had had silver for a standard, and the prices of commodities had not fallen, we should have had a great rise in money wages and salaries, and difficulties of that kind to contend with.

18,637. (*Mr Chaplin.*) Are we to derive from that that you would consider the standard which is the most stable, the least good of the two for England?—But you cannot have a stable standard; that is my point of view.

Mr. R. Giffen, C.B.
27 Apr. 1894.

18,638. I did not say that there is greater and lesser stability, as is shown by what you have just told us. It is clear that the silver standard has been more stable than the gold standard?—For commodities alone, but not for wages.

18,639. Then do you mean to imply by the answer given just now to Mr. Everett that you prefer the less stable standard of the two for this country?—I think, on the whole, gold has been a better standard for this country than silver would have been, just as silver has been a better standard for India than gold would have been. But this is an illustration that you may have two standards diverging widely from each other, yet, as far as I can judge, the countries that have got the different standards have been better suited than if they had had the same ones.

18,640. You mean that you think on the whole gold is the better standard for this country, although it is a less stable standard than silver?—I do not think it is a less stable standard; that is just what I do not admit. It has been less stable measured by certain wholesale commodities, but it has been more stable measured by wages, and you must take the two things together.

18,641. (*Mr. Everett.*) Coming to that point, I understood you to express the opinion that in measuring the commodity, gold, the average wholesale prices of commodities was really a more accurate test than labour was?—I do not think I said that; "accurate" was not the phrase.

Gold and labour compared as measure of prices of commodities.

18,642. At any rate commodities and labour are two different things that you recognise?—They are two.

18,643. And labour is open to certain moral influences, is it not: you can affect the value of labour by combinations and strikes, and a general feeling that the working people ought to have a larger share of the produce than they have had? Those things enter to a certain extent into the value of labour more than they do into the value of commodities, do they not?—I do not think I can quite follow that; all I point out is that the two things are different, and if the one goes one way, the other goes another, and you cannot have anything to measure them by which will suit both; it is quite impossible.

18,644. But gold being a commodity would it not seem that you could more accurately measure the movements that take place in it by measuring it with a group of other commodities than by measuring it with labour into which what I might call moral considerations enter, it not being a pure commodity?—But practically you must have both. Gold must meet the transactions in both labour and commodities, and the standard whatever you have must be adapted to transactions in both.

Position of working classes.

18,645 Then with regard to the position of the working classes you rightly expressed the opinion that for those of them who are in employment to retain as good a position as they have now if the level of prices had kept up they would have had to have an increase of wages?—An increase of money wages.

18,646. Do you not think it conduces more to the happiness and contentment of a class to have their money wages raised than to receive an equivalent in the falling prices of what they buy with wages?—I do not think it is a material matter at all.

18,647. Do you not think their feelings are more gratified by an increase in their wages?—You mean to say that it produces a greater amount of happiness to have wages going up?

18,648. Yes?—Whether they really improve or not?

18,649. Yes?—I do not think that is a very material matter.

18,650. Do you not think that all people like to have their salaries heightened?—I do not think it is so material an element of human happiness as you seem to imagine from these questions.

Agitation in favour of change of currency.

18,651. You spoke of there being so much agitation in agriculture as compared with other trades; I was wondering whether you had not omitted to remember Lancashire and the great agitation that there has been there to have some change in the currency because of the great influence for evil which they imagine what has been done has had upon the cotton trade and their industries generally?—I do not think there has been so much real complaint in Lancashire as there has been in agricultural districts. The movement in regard to currency, it seems to me, is, if I may say so, very largely artificial and the result of an artificial agitation.

Mr. E. Giffen, C.B.
27 Apr. 1894.

18,652. It has excited sufficient interest in Lancashire, has it not, so that they have been willing to subscribe thousands and even tens of thousands of pounds to try and get the state of things altered?—Yes, but Lancashire as we know has quite lately subscribed 15 millions sterling for the Manchester Ship Canal.

18,653. Hoping to get the money back again as an investment?—If we measure the two things together evidently they attach infinite importance to the Canal and very little to the currency question.

18,654. Is it not the case that a candidate has very little chance at an election in Lancashire if he is not an advocate of a revision of the standard of the currency?—I am afraid that is a political question that I ought not to speak about.

Depression in railways and agriculture compared.

18,655. You spoke of railways not having suffered so much as agriculture; ought we not to take into consideration the fact that railways possess a monopoly?—I think not; it has been mainly due to the progressive character of the business; they have been doing more business, so that many things that were operating against them have been compensated by the increase of the business, and the result is that the dividends to the shareholders have not gone down so much as they otherwise would have done.

18,656. Still they do possess a monopoly, do they not?—They possess a practical monopoly to some extent qualified by many things.

18,657. Their effort to take care of their shareholders by heightening their charges has produced an enormous outcry among the trading classes, because of the railway companies trying to use that monopoly to save themselves at the expense of the trading community?—That may be so, but I do not think I can say that it is the monopoly which has enabled the railway companies to preserve their position.

Rise in wages means fall in rents.

18,658. Then I should like to call your attention to another question which I should be truly glad if you would help me to elucidate; you spoke of the better reward that labour obtains in agriculture now and that that necessarily implies less being left for the landlord. I would like to call your attention to this, and I think that your judgment of what we have heard at this table will agree with mine, that the agricultural districts where agricultural wages are highest are the districts in which rents are also highest, and the districts in which rents have fallen least and where the farmers have suffered least. How do you make those things agree with the opinion you expressed that a rise in wages necessarily means a fall in rents?—I do not see that there is any contradiction between them. It may be the case that wages as a rule are highest where rents are highest, and yet it may also be true that if wages increase from a given point, the increase is at the expense of the rent. There is no inconsistency between the two statements that I can see.

18,659. It struck me very much in the evidence before us that if you get into a district where wages are high you get into a district where rents are also high and where they have fallen less?—Still that would not alter the fact that an improvement of wages from a given point, the gross produce not increasing, must come out of the rent.

18,660. In the good times within my memory wages and rent both went up side by side?—Not the real wages and the real rent.

18,661. I am speaking in this case of money?—I am speaking of the produce which a labourer consumes, or its equivalent. If he gets more the landlord must get less, the gross produce not increasing.

Advantages of single and double standard compared.

18,662. Coming now to the question of standard, you would admit, I think, that the most stable standard that can be obtained is desirable; that it is one of the elements which is very valuable in a standard that you should have stability?—That it should be stable over very short periods is the condition of your having a standard at all, but I do not admit that it is desirable to have what is impossible; that is to say, a standard which is stable over long periods, because I do not think that is possible in the nature of things.

18,663. In human affairs the ideally perfect is often impossible of attainment, is it not?—But in this particular case the institution was a spontaneous thing in order that transactions between man and man, the daily transactions of life, should go on at all. It was absolutely indispensable that you should have money to enable them to go on at all. It was an extension of the use of money to think that you could have obligations extending over distant periods expressed in it, and the experience of mankind is that, although money is indispensable for the first purpose, it is quite impossible to put obligations over a long period into a money form with safety.

Mr. E. Giffen, C.B.
27 Apr. 1894.

18,664. The probable reason, I suppose, why gold and silver have been chosen as standards of value is because in the experience of mankind they differ less in value as compared with commodities than any other known article?—No; it was because they did not sensibly differ over short periods, because they were very portable, and because they were indestructible and had other advantages of that kind. But I do not think the element of their being suitable for obligations over a long period ever entered into the imaginations of men when money began to be used.

18,665. What are the main causes of the variation in value of a metal standard, that is, a standard of the precious metals, which would lead it to appreciate or depreciate?—I should say it would be like every other commodity known to mankind. The changes in the precious metals over long periods have simply been enormous; that is all one can say.

18,666. And they arise from differences of supply and from differences of demand, do they not?—And from both; they arise in all sorts of ways; but how can we tell all the things that operated upon the precious metals three or four centuries ago, for instance, during which there was an enormous fall in the value of silver.

Annual supply of gold and silver.

18,667. The joint annual supply of gold and silver is a much more constant quantity than the annual supply of either one metal alone, is it not?—I do not think we have sufficient evidence of that at all, and it would depend entirely over what periods you made the computation.

18,668. The whole periods known to mankind?—But over a large part of the period we have not very good evidence of the annual supply at all.

18,669. Those of which we have evidence?—I do not think you can say that.

18,670. There is a table, I think, in the Report of the Gold and Silver Commission which gives the annual supply of the two precious metals as far as known; that shows most conclusively that the joint annual product is a much more constant factor than the single product of either one metal alone?—A much more constant factor measured by the average of commodities?

18,671. No; by the metal itself—the quantity?—I think that is one of those statements which I could form no opinion upon until I examined it. Although it may be true over a very considerable period, yet it may not be true over short periods. There are all sorts of qualifications to be taken into account.

18,672. The point that I was wishing to come to was, are not the two metals in use together so far as regards annual production likely to be a more constant quantity than either one taken separately?—That may have happened for a great many years and for a great many centuries, but you would not know as a practical question whether it was going to happen in the next 20 years or not.

18,673. Is not the joint mass of silver and gold in the possession of mankind a very much larger mass than the mass of either metal separately, of course that is self-evident?—And if you added the mass of copper and the mass of tin you might have a very large mass indeed.

18,674. The annual addition of new finds of one metal to the joint mass of the two precious metals is a smaller matter, if you add it to the whole mass of the two metals put together than it would be if it came to only one of them; that is, the gold discoveries would have produced a much greater effect on the value of gold had they come to gold alone?—Take the other case of gold and silver discoveries simultaneously, which happened in my experience about 30 years ago.

18,675. The annual supply would bear a smaller relation to the joint mass?—No, the annual supply bore the same relation to the joint mass, because it was equally in gold and in silver, and you do not know beforehand what is going to happen.

18,676. But you do know, do you not, that the whole joint mass of the two is a bigger mass than the mass of one?—Surely that is an obvious arithmetical statement

Mr. R. Giffen, C.B.
27 Apr. 1894.

18,677. And a large addition of silver, for instance, would have a less effect spread over the whole joint mass?—If you could spread it over the joint mass; that would raise the other question whether you could do so or not.

Effect of an excess supply of gold and silver compared.

18,678. On the other hand, if the excess were in gold that again would have a less effect; the great gold discoveries were steadied in their effect, probably, by their coming to a joint mass?—I think not. I think there is no evidence of that as a matter of fact.

18,679. You are aware that many economists believed so, are you not?—I do not know any economists who have discussed it. As a matter of fact, I have seen a great many statements of general theory, but I have never seen a discussion of the actual facts. I have been engaged in a correspondence myself with one or two distinguished economists upon the facts, and I find that they really knew nothing about it.

18,680. (*Mr. Chaplin.*) I beg your pardon, no economists who had discussed what?—The actual effects of the gold discoveries and how they came to be used.

18,681. (*Mr. Everett.*) My point was that the gold discoveries were minimised in their effects by the fact that they came to the joint existing mass of gold and silver instead of coming to gold separated from silver?—I think there is no evidence of that

18,682. You have read, of course, the statement of Chevalier that the open Mint of France acted like a parachute?—But I am also acquainted with facts with which Chevalier could not be acquainted, and that is that the parachute operated to a very small extent indeed, as a matter of fact. About this very point Chevalier talked before the event about the great benefit that France was going to confer as a parachute, and about gold taking the place of silver, but as a matter of fact the whole amount of silver that France parted with in 20 years after the gold discoveries was something like 50 millions sterling, and that was the whole exchange between the two metals as far as one can judge that took place out of about 600 or 700 millions of production.

18,683. But the relative value of gold and silver in that time altered extremely little, did it not?—Not very much, but still as a matter of fact there was very little interchange.

Appreciation of gold.

18,684. I see I shall not be able to ask you all the questions I wanted to ask, but I do want to ask whether the appreciation which has taken place in gold is not mainly due to legislation?—I think not. I think legislation always follows the necessities of communities to a very large extent. In this particular case the changes have not been so very great as compared with what was considered to be the permanent condition of things 30 years ago. For instance, the change in France which is spoken of as a change—the suspension of the coinage in 1874—was no doubt carried out deliberately in pursuance of a policy that was adopted many years before, so that you may say the system in France has not been changed since 1850; you had an actual bit of legislation in 1874, but that was no real change as the policy had been definitely adopted long before.

18,685. That is different to all that I have read. The great demand of gold for Germany was the result of legislation, was it not?—That was the result also of a change of circumstances.

Legislation in the United States.

18,686. And the closing of the Mint in the United States against the free coinage of silver was an act of legislation, was it not?—Do you mean the Act of 1873?

18,687. Yes?—But then that also was an Act which was simply confirming what had been the money of the United States for a long time before, and was not considered really to be a change from the use of money in the United States. I do not think it was a change in the sense that you are trying to make out.

18,688. It was a change of law, was it not?—It was a change of law, but not a change of practice.

18,689. Until that law was passed anyone in the world who had silver could carry that silver to the United States mint and have it coined into full legal tender coin at the ratio of 16 to 1?—That was so, but still the sort of general monetary constitution of the United States before 1873 was that it was a gold standard country practically, and all that the Act of 1873 was intended to do was to confirm what existed.

Mr. R. Giffen, C.B.
27 Apr. 1894.

18,690. How came it that the money chiefly in the United States before they abandoned cash payments was gold rather than silver; was it the choice of the people, or was it the ratio of the mint?—It was the choice of the people, in this way, that they were not satisfied with the monetary condition which had come about in 1836, when they had silver and no gold, and they made a change by which they were enabled to go from silver to gold under the bimetallic form.

18,691. Until 1836 the ratio was 15 to 1, was it not?—15 to 1, I believe.

18,692. And the movement of the metals in the United States has exactly followed the movement of the Mint law, has it not?—But the Mint law was changed deliberately for the purpose of acquiring the gold which they wanted, just as the ratios in bimetallic countries in the old times were continually changed in order to enable each country to get the metal that it wanted.

18,693. As a matter of fact the metals have followed the Mint law in past experience?—And the Mint law follows the wish of the people as to what metal they mean to have.

18,694. But the wish of the people as against the Mint law is powerless, is it not—the Mint law is the mightier of the two?—I do not think you can even say that; sometimes a community can take to a particular metal without a Mint law just as we did in this country.

18,695. Did not Sir Isaac Newton in 1717 advise the altering of the Mint indentures in order to keep both the precious metals circulating?—I do not think the Mint indentures were altered as a matter of fact.

Mint ratio and actual ratio compared.

18,696. I do not know whether I use the right technical term, but he advised the different estimation by the Government of gold and silver?—Yes, there was some change of that kind, but the estimation by which the money passed current was really slightly different, I think, from what he advised—that it was not to be above a certain point. The Mint ratio in England was quite different from the actual ratio between gold and silver for a great many years.

18,697. When that was so the gold or the silver, whichever it paid the purpose of the bullion merchants to take away, was moved out of the country?—Practically so. From about 1697 England was a gold standard country to all intents and purposes and deliberately so; there was no intention to have silver.

18,698. It was in 1717 that Sir Isaac Newton was consulted, was it not?—Yes, that was so, because it was found that they did not seem to have enough silver. But they never made any change by which the silver was called back. There was hardly any coinage of silver all through last century down to 1816, and on the only occasion when it was likely that silver in any quantity was going to be brought to the Mint, I think in 1798, a law was passed at the moment forbidding the presentation of silver to the Mint for coinage.

Gold in England in 1816.

18,699. Was not the fact that gold was the most abundant coin in England in 1816 accounted for by just the very same reason which made gold the most abundant coin in the United States, when they coined at 16 to 1, and silver the most abundant coin when they coined at 15 to 1?—I think not, unless you recognise the fact that gold was deliberately chosen by the people in both cases as far as I can judge, and certain legislation was adopted for the purpose of giving them the gold.

18,700. Are you aware that the change made in 1816 was made practically without any discussion and that the name of the Act by which the change was made was an Act for establishing a new silver coinage?—I happen to have read the discussion myself. There was a good deal of discussion, and, as far as the establishment of a single standard was concerned there was absolute unanimity; the point was discussed a good deal and there was absolute unanimity. The only exception to the unanimity with which the Act was passed, was that one gentleman, I forget his name, a peer, was in favour of having silver for the standard. The object of the Act was adequately explained. There was a very good discussion upon it and the establishment of the single gold standard was made with absolute unanimity. I have read the discussion.

Stability of silver.

18,701. (*Mr. Elton.*) Can you tell me about the stability of silver as silver; is that connected with the fact that there is an absolute unlimited supply of silver to be dug out; is it not the large quantity of silver

which can be got at call which makes it more like an ordinary commodity—like beef or mutton and so on?—I do not know that you can say that.

18,702. Is that a reason which you give in your own mind for its being more like other commodities in stability?—I do not think I said it was more like other commodities.

18,703. You said it was more stable?—I said it had been over a certain period more stable measured by the average of other commodities, but that is not expressing an opinion as to whether it will be more stable in future or what the causes of its stability are.

18,704. That was not the reason you gave in your own mind for its being like that?—No, I should not like to go beyond the bare expression of what the fact has been.

18,705. (*Mr. Chaplin.*) Have you not formed an opinion as to why the fact is so?—Not altogether, but I think as the question has been put and the point has been mentioned it may be interesting to state that Ricardo at the beginning of the century, while in favour of a single standard, was for a good while I think (as is expressed in some of his writings) in favour of a single silver standard, yet before the resumption of specie payments he came round and he expressed his agreement with those who were in favour of a single gold standard. The reason he gave then for coming round to the opinion that gold was more suitable than silver as the single standard was that he anticipated a great fall in silver from the opening of the South American Mines. I believe Ricardo was substantially sound in his anticipation although many years elapsed before the production of those American mines became so enormously abundant as he anticipated.

18,706. (*Mr. Everett.*) The near facts were exactly the other way were they not?—There was an interval in which gold became abundant; but the reason why Ricardo changed from a silver to a gold standard was that he expected silver would become less valuable.

18,707. (*Mr. Elton.*) I was going to suggest that there was a scarcity of silver, such a scarcity partly owing to Potosi being worked out perhaps, but there was a scarcity which led people to favour the notion of a gold standard; then they saw there was a lot of silver in Mexico at any rate, and they began to see that it would not be so sensitive a standard as gold?—I do not think the thing had been worked out very carefully by many people who studied these subjects, they were not in possession of the statistical information that we have now.

18,708. Their minds might have moved to the facts though they might not have formulated them?—A mind like Ricardo's always forms its opinion upon some data; he never expressed an opinion at random you may be quite sure.

18,709. He would follow the facts though he might no have formulated them?—Yes.

Fluctuations in prices of commodities and wheat compared.

18,710. I want now to ask you a question about the curve on the diagram on the wall. I see in 1842–43 the price point is on the line 90, and in 1892 it is down to the line 70; is it within your knowledge that though that is the average price the fluctuations in price were enormous in 1842–43, the difference between the rise and fall say in the price of wheat was very great, so great as to be a serious inconvenience?—I have an impression that all the time from 1830 to 1850 was a time of great fluctuations.

18,711. I dare say you have read the discussions about the time of the passing of the corn law legislation and you will recollect how the farmers complained of the fluctuations of wheat which made the preservation of the Corn Laws in the opinion of some of them not very important?—I know that the fluctuations in agricultural products were very considerable.

18,712. That is the main point, at any rate?—I think Cobden mentions it in a good many of his addresses to farmers which were very popular then.

18,713. Yes, and you can read it in the debates on the Corn Laws?—Yes.

18,714. Now we are at much the same point; allowing for the change in the purchasing power, allowing that there has been a rise in the quantity of what you get for a sovereign, we are at about the same point of material benefit as we were in 1842–43?—Relatively allowing for the increased purchasing power of money.

18,715. I make another allowance because our prices do not jump up and down so violently as to make it impossible to continue business, as they did very often in the earlier period?—I think, on the whole, the tendency of modern arrangements is to diminish the fluctuations of prices from year to year.

Mr. R. Giffen, C.B. 27 Apr. 1894.

18,716. In using curves like that, we must take into account things that could not be represented there, like stability of prices and fluctuation of prices, must we not?—That could not be shown in a curve; you mean over short periods?

18,717. Yes, periods like 40 or 50 years?—That would not be shown in a curve like that.

18,718. You could not show it by such a diagram?—No.

18,719. How do you account for the great fall and depression in a place like the extreme Western States of America; do you account for it there by the competition of other countries, although there is no initial expense, such as large sums to pay for rent, tithes, and so on?—I think partly the competition of other countries, and partly the excessive extent of the cultivation in the far West itself. You might have had too many people going on to the land for them all to be able to sell their surplus produce profitably.

18,720. Otherwise we get into the difficulty that the old country says it is pulled down because the new country does it, and the new country says it is pulled down because the old country does it; they cannot both be true?—They may both be true to some extent.

18,721. You mean they may be true for other reasons?—Yes, that may be so.

18,722. Can you tell us whether you consider the Indian labourers' difficulty that we used to hear so much about has come to an end? I will put it very shortly, because of the time; the Indian labourer used to take his wages without allowing for any difference in the price of silver having fallen, and, therefore, the man who paid a great number of three-halfpenny wages was able to make a very large profit, and to undersell the farmer in England?—I think that that may have been to the advantage of the man who had Indian wheat to sell, as far as it went, but I do not think that that would be the thing which regulated the price of wheat on the London market, because although the Indian man could sell for less, he was not going to sell for less than he would have done before, although he could afford to do so. If he could get a better price he was still going to stick out for a better price. I believe that the price is absolutely regulated by the supply and the demand upon the London market.

18,723. In fact, there would be a certain amount of human nature in the vendor of the wheat as well as in the labourer at the other end of the scale?—I think so.

18,724. One would be lazy and the other competitive?—I think so.

18,725. (*Mr. Chaplin.*) Do I understand you that as between the Indian grower on the one hand and the English on the other, you do consider that it gives to the Indian an advantage?—That it enables him to make a greater profit relatively?

Effect of wages of labour on rent.

18,726. Yes?—That I admit. What I was disputing was whether it enabled him to settle the price.

18,727. (*Mr. Elton.*) Of course. I was only trying to get a clear fact without leading to any opinion one way or the other. As to the variation of wages I have a question: The variation of wages is not a correlative, I take it, from your answers to a fall in rent?—No; they go together to some extent, and the rise in real wages accounts to some extent for the fall in rent, but they are not proportioned one to the other.

18,728. I notice in the part of the country where I live for the most part that in what we are all agreed about—these figures—the wages in Somerset have gone back to say the 1842–43 standard, but the wages in the adjoining county are two or three shillings at least more, they have not gone back in proportion; and yet according to the general opinion the fall in the Western counties is pretty uniform all over the place. I suppose the real answer to that sort of puzzle would be that rents do not fall regularly with the price of wages, but that wages are affected by a great number of local circumstances which may have strange local effects?—I think that must be so.

18,729. As, for instance, in an agricultural district many miles large, the wages might fall back, and they

might be prevented from falling back if they were near Plymouth or some large town, that is to say, the fall is marked by the proximity of the town keeping wages up?—I think that would be so. We must always beware of reasoning too finely in particular cases, and we must look out for local differences.

Ratio of silver to gold.

18,730. The facts are singular, but I think they could be accounted for in those ways. Could you tell me where the table giving the ratio of silver to gold is taken from—what authority it represents?—For the earlier years it is taken from Soetbeer, but I may say that I have sufficient knowledge of the subject to know that for the earlier dates which you have got there the ratios are those of the mints, and that they are not actually market ratios in the sense in which we have been getting the ratio of gold and silver of late years.

18,731. I see that gold was 10·75 to one at 1 time, but gold was found before silver in great quantities, I think—the silver came in in large quantities after a great quantity of gold had come?—I think for a considerable part of that period there was comparatively little gold. I know that before 1500 there was comparatively little gold used, the money being silver, but in the middle of the 17th century there were very considerable arrivals of gold beginning. The gold came from the Guinea Coast, that was the first thing that was noticed.

18,732. In the 17th century?—In the middle of the 17th century; there were considerable quantities of gold which were found to be coming from the Guinea Coast, and that was the origin of the expression of guineas.

18,733. It came before that time?—I did not know.

18,734. (*Mr. Everett.*) Guineas were started in Charles II.'s time?—That was the middle of the 17th century.

Fluctuations in prices and rents in the 16th century.

18,735. (*Mr. Elton.*) The gold had come a long time before, but the Dutch had prevented our people from going there. What I was going to ask was this question in order to lay the foundation for another inquiry: Have you considered the discussions which took place about the tremendous changes in prices and rise in rents, and then afterwards fall in rents in the 16th century owing to the introduction of silver from America?—Do you refer to Bishop Fleetwood's Chronicon Preciosum, and books of that kind?

18,736. Many of the facts are in that. Then there is the celebrated statement of Bishop Latimer, and there is an Elizabethan tract which gives a dialogue between a knight, a husbandman, and a trader?—They were occupied at that time, I think, with the great fall in the value of money which had taken place. The purchasing power of money over two centuries seemed to have diminished enormously.

18,737. I think Latimer said rents had gone up four times?—That was so.

18,738. Then, in Elizabeth's time there was a terrible reaction, as they said—a great depression?—I have not followed the history very carefully.

18,739. You know there were these ups and downs?—I know there were these ups and downs.

18,740. Do you think it might be worth while for someone to look into that matter and investigate it a little more carefully?—I think people who are providing for a generation or two ahead, making endowments and things of that kind, should consider these matters very particularly.

18,741. You do not think we should find that the exact depression which we have met to consider might be usefully illustrated by the previous depressions?—I think they all bear upon each other.

Effect of bi-metallic system on prices.

18,742. (*Mr. Chaplin.*) Supposing that the bi-metallic system was re-adopted by the leading nations, say, at the old ratio, what is your impression as to the effect that that would have upon prices?—If the Governments were to agree upon the ratio and to pass the necessary legislation, and if the different communities were to act upon the legislation, which it seems to me is a doubtful matter, then silver would become the sole standard of money throughout the world and all the prices would be silver prices.

18,743. There is a great divergence at present between gold prices and silver prices, is that not so?—If the Governments were to agree as you propose you would after that have no gold prices at all, they would all be silver prices, and gold would be quoted in silver just like any other article.

18,744. There is a great divergence at present between gold and silver prices, is there not?—That is to say, they have diverged from what they were 20 years ago.

18,745. Silver prices have remained practically the same, and gold prices have fallen very considerably?—As compared with 20 or 25 years ago.

18,746. Then the effect of such a policy as I have suggested would be to go back substantially to the old prices?—The effect would be that people would pay what are practically now gold debts with silver at a better ratio than the market gives them, which would be a very good thing for those that have to pay the debts.

18,747. As good a thing for those who have got to pay debts as it has been a bad thing for those under the present *regime*?—Only the number of people who have to pay old debts is comparatively a small matter, and you would change not only the payment of all debts, but all transactions of shorter date between man and man, which would be a great interruption to business, and one of the most mischievous things that could possibly be done.

18,748. That I can quite understand is your opinion, but without entering into these questions, the effect of the suggestion I have submitted to you, I understand, would be practically to restore the positions as regards prices compared with 20 years ago?—Subject to the very important "ifs" which I have mentioned.

18,749. (*Mr. Everett.*) When you wrote this essay on prices and incomes, you rather confidently expressed the opinion that the fall in prices would continue, and very likely continue for another generation, did you not?—I was extremely doubtful when I wrote that about what the effects of the South African discoveries would be. That was practically written six years ago, and a good deal has happened since then.

Adjourned till Thursday next at 12 o'clock.

Thirty-fourth Day.

Thursday, 3rd May 1894.

PRESENT:

THE RIGHT HON. GEORGE JOHN SHAW-LEFEVRE, M.P., IN THE CHAIR.

Viscount COBHAM.
The Right Hon. HENRY CHAPLIN, M.P.
Sir ROBERT NIGEL FITZHARDINGE KINGSCOTE, K.C.B.
ROBERT GIFFEN, Esq., C.B.
Captain OWEN THOMAS.
FRANCIS ALLSTON CHANNING, Esq., M.P.
JOHN CLAY, Esq.
CORNELIUS NEALE DALTON, Esq., C.B.
ROBERT LACEY EVERETT, Esq., M.P.
WILLIAM CUTLACK LITTLE, Esq.

HERBERT LYON, Esq., *Secretary*.
R. F. CRAWFORD, Esq., *Assistant Secretary*.

Mr. R. L. Everett, M.P. — 3 May 1894.

Mr. ROBERT LACEY EVERETT, M.P. (a member of the Commission), examined.

18,750. (*Mr. Chaplin.*) I believe you are a member for the Woodbridge Division of Suffolk?—Yes.

18,751. You occupy land of your own, I think, which has been farmed by your predecessors for a great number of years?—That is so.

18,752. Have you some connexion with the Ipswich Farmers' Club and the East Suffolk Chamber of Agriculture?—During all the time the Ipswich Farmers' Club was in existence separately I was Secretary, and when it was merged into the East Suffolk Chamber of Agriculture I filled for some years the same office there.

18,753. You stood as a Liberal Farmers' candidate in 1880, I think?—That was so, and I was only defeated by 114 votes.

18,754. And you have been returned since?—Yes, in 1885 after the new franchise; I was beaten in 1886 and returned again in 1892.

Particulars of his own farm.

18,755. Can you tell us how much land you farm, and what is the character of your farm?—I farm about 374 acres, which is all good mixed soil land quite close to the flourishing town of Ipswich.

18,756. How long have you been farming that?—Since some time in the sixties.

18,757. What has been the result of your experience upon that farm?—Down till 1879 I had made on the average 10 per cent. on my capital employed as a farmer and 4 per cent. as landlord, but since then I have lost money in quite as many years as I have gained.

18,758. You have lost as much money, do you say, as you have gained? Do you mean that you have lost part of your capital?—Yes, I have lost part of my capital as a farmer, and, of course, a great deal of my capital as the owner of the farm.

18,759. Since 1879 have you paid any interest on the capital embarked in the cultivation of the farm?—Perhaps a trifle, but I have had no reward for myself, and I have not had 4 per cent. for my money as owner.

18,760. You have not made 4 per cent. on your money, and you have lost some of your capital since 1879?—That is so.

18,761. (*Mr. Giffen.*) Have you received any interest on your capital as owner?—Yes.

18,762. That is to say, you have paid yourself some rent?—Yes.

18,763. (*Mr. Chaplin.*) How much per acre have you paid yourself in rent?—I should think since 1879 it would be about 30*s.* an acre.

18,764. Then your position since 1879, I understand, is this: that after paying your rent you have not made so much as 4 per cent. interest, and you have lost some of your capital?—That is so.

18,765. (*Mr. Clay.*) In 1879, when the bad times came, what did you assess yourself at as rent?—I think I put my rent then from something over 2*l.* down to 30*s.*

18,766. Did you pay rates on that 30*s.*?—Yes.

18,767. (*Chairman.*) What have you been assessed at lately?—I think about 30*s.* an acre.

18,768. (*Mr. Chaplin.*) Could you have let your farm well prior to 1879?—I should have had any number of applications if it had been known that it would be in the market; at 3*l.* an acre I could have let it quite easily.

18,769. I suppose it is a good farm, and in a good condition?—Yes, and in a good situation.

18,770. What would be the position now if you had a wish to let it?—I should have much greater difficulty in making 30*s.* an acre now than I should have had then in making 3*l.*

18,771. Is it still in good condition?—Yes, it is clean and in a good state.

Falling in letting and selling value of land in Suffolk.

18,772. Is that your experience generally of farms in the county of Suffolk?—Most farms have fallen in value much more than mine, mine being saved partly by its good quality and partly by its close neighbourhood to Ipswich. When you get a little way from a growing town the depréciation in the value of land is something perfectly awful in Suffolk, both its letting depreciation and its saleable depreciation, the latter being greater than the former.

18,773. What is the depreciation from the letting point of view? what is the depreciation in rent as a rule?—I should put it at 50 per cent. as a whole, varying from a little less than that in very good farms favourably situated to enormously more than that in anything that is inferior whether very light or very heavy.

18,774. Can you say what is the maximum fall of rents that has occurred in Suffolk?—I think there are many instances where it has fallen as much as 80 per cent.

18,775. Are there any instances of land which has gone out of cultivation altogether and which pays no rent at all, but which used to pay rent?—There are a few cases, and a great deal of land the landowners have kept in their own hands rather than let it for nothing.

18,776. What has been the fall in the selling value of the land?—I feel confident that on the million acres of agricultural land in Suffolk the selling value has declined fully 20*l.* an acre—more than that, I think, but quite 20*l.* an acre.

18,777. From what?—From 40*l.* or 45*l.* I should think, probably.

18,778. Then in the selling value it has not fallen quite 50 per cent.?—I think it has.

18,779. Is there anything of a market for purely agricultural land at all, land I mean which possesses no attractions for residential purposes?—Hardly any; it is much more difficult to sell land of that kind at 10*l.* or 15*l.* an acre now than it used to be at 45*l.* an acre. We had a perfectly ready market at 45*l.* an acre down till 1879.

Mr. R. L. Everett, M.P.
3 May 1894.

18,780. In the case, for instance, of a forced sale would land of the character that you are describing be saleable at all, and if it was saleable what do you imagine it would make?—There have been several cases of farms sold for less than 10*l.* an acre, and there have been a few cases where the freehold of the farm has only made about one or two years of the rent that was paid for it in the good times.

18,781. There are instances of land since 1879 having been sold, I understand you, for two years' purchase of what would have been the rent previous to 1879?—That is so.

Condition of farmers in Suffolk.

18,782. What, under all these circumstances, has been the condition of the farmers?—Steadily going into bankruptcy and ruin in the case of those who have had no other resource than their farms.

18,783. Are you speaking now of men who previously did well?—Yes; I think, taking the farmers of Suffolk as a whole, there was not a more capable, frugal, industrious, worthy class of men, and the bankruptcy of a farmer in all my early experience was a thing quite unknown. Now that same class of men have seen the great bulk of their savings, or their fathers' savings swept away, and with all their industry and pinching and care they are unable to preserve themselves from a very near approach to bankruptcy.

18,784. Are there instances in Suffolk of men who have bought their farms in former days?—I am sorry to say there are a great many. We had a great many yeomen farmers, and in the intense competition for land in the good times a great many men took that course of making themselves, as they thought, independent. They bought land and mortgaged it, and I should think three-quarters of that class of men are now stripped of every penny they had.

Change in value of money cause of depression.

18,785. What do you attribute this unfortunate state of things to?—My firm conviction, grounded on careful study of all the circumstances, is that it is due almost entirely to a change in the value of money, brought about by recent legislation.

18,786. I think you have given a good deal of attention to that subject?—I have given a great deal of attention to it for a good many years past.

18,787. (*Mr. Giffen.*) Might I ask when you began paying attention to this subject?—I think it was an article by Professor Jevons in "The Contemporary," or somewhere that first opened my eyes. He began with the remark something like this:—"What is price?" and then went on to point out that in England the price is gold.

18,788. What date was that?—I think that was early in the eighties. He pointed out that if anything happened to gold (which was a commodity like anything else), to raise its value, the necessary effect of that would be to cause a fall in prices. Before then I had lived altogether thoughtless of the fact that money changed materially in value from time to time, though I remember hearing my grandfather speaking of a time earlier in the century, when farms went begging, and he used to tell me that it had something to do with the return to cash payments, but he did not understand the philosophy or the history of it much. I have since found out that that was a perfectly true statement.

18,789. (*Mr. Chaplin.*) When you say that you consider the ruin of these farmers is almost entirely due to the change in the value of money brought about by recent legislation, you were referring, I suppose, to the effect upon them of what is known as the appreciation of gold?—That is so. It is the change in prices that has wrought the whole of the ruin.

18,790. Are you of opinion that that change is partly owing to the influence on prices of something that has happened to money itself?—Certainly, because money is half of every bargain that a farmer makes. When he sells his corn or his wool or his stock, in effect he barters it for money, which in England is gold: and consequently if anything happens to the money half of the barter, to greatly raise its value, it affects the terms of the barter just as much as if something had happened to the produce half of the barter.

18,791. What does the value of this money depend upon in your judgment?—It is ruled entirely by supply and demand, just the same as the value of anything else is, so far as I can understand the facts.

Relation of prices to supply of money.

18,792. In this case you hold that this appreciation of gold has been caused by increased demands upon the gold, following upon this monetary legislation?—And coincident with a diminution of the supply. The two things occurred simultaneously and moved on, abreast of one another. I should like, if the Commission would allow me, to cite briefly a few authorities as to the fact that the quantity of money in circulation is the great factor in determining the general level of prices. Adam Smith said, "The quantity of goods or labour which a "given quantity of gold or silver will exchange for "depends always upon the fertility or barrenness of the "mines which happen to be known about the time "when such exchanges are made." John Stuart Mill said, "That an increase of the quantity of money raises "prices, and a diminution lowers them is the most "elementary proposition in the theory of currency, "and without it we should have no key to any of the "others." John Locke said, "The lessening of the "quantity of money makes an equal quantity of it "exchange for a larger quantity of any other thing." Hume said, "It is the proportion between the circulat- "ing money and the commodities in the market which "determines the price," and Ricardo said, "That "commodities rise or fall in price in proportion to the "increase or diminution of money. I assume, as a fact, "that is incontrovertible." Then I have here two or three very short extracts from the report of the famous Bullion Committee which sat in 1810, and was presided over by Francis Horner, and on which William Huskisson, Henry Thornton, and Mr. Peel, afterwards the great Sir Robert Peel, sat. In their report they said, "A diminution or increase in the general supply of "gold will no doubt have a material effect on the price "of all other articles." Again, they said, "An in- "crease in the supply of the precious metals raises "prices all over the world," and they point out that the average amount of Bank of England notes in 1798 was 13,334,000*l.*; this is now coming to the period of inconvertible paper money, and in 1809 it had risen to 19,000,000, and country issues had increased in proportion. Then they further say, "The increase in the "general paper currency in 1809 was probably little "short of the amount which in any one year since the "discovery of America has been added to the circu- "lating medium of the whole of Europe," and so in their judgment accounted for the rise of prices which occurred at that time.

Mr. R. L. Everett, M.P.
3 May 1894.

18,793. Are you of opinion that the views of those authorities which you have quoted are borne out by the experience of agriculture in the past?—The history of agriculture is really one great illustration of the close connexion between the supply of money and prices, in my judgment. That is the result of my historical research, and of quotations from authorities of all kinds.

18,794. I observe that in your brief you refer to the discovery of America, and the mines of Potosi; are you able to give us later illustrations than those, without going back quite so far in history as the time of the mines of Potosi, or would you desire to say anything upon that point?—I should like to say generally in regard to that, that it is an indisputable fact, recognised by all economists and historians, that following on the discovery of America, and the pouring of large quantities of the precious metals into Europe, especially after the opening of the mines of Potosi, prices through the next century and a half, or two centuries, moved upwards until they had attained to between four times and six times the prices, which had prevailed for a long period before that great addition to the precious metals. When America was discovered, which was in 1492, at the close of the 15th century, it is estimated that the monetary stock of Europe did not exceed 34 millions, while the annual produce of the mines was under 100,000*l.* I take that from Jacob's book on the precious metals. The average price of wheat then in England, in the 12 years, 1551 to 1562, was 8*s.* 10*d.* per quarter of our money, and the price of a good bullock was about 30*s.* That was half a century after the discovery of America, but about the time that the great silver mines of Potosi were discovered. They were discovered in the middle of the fifteen hundreds. Then from the plunder of America, and after 1545, from the newly-discovered mines of Potosi, an immense quantity of the precious metals came to Europe. After the discovery of the mines of Potosi, the annual supply rose to over two millions, or 20 times the supply at the commencement of the century. Before the close of the century the monetary stock of Europe had increased fivefold, and all prices were quadrupled. I take that from Jacobs' too. As supplies continued to increase through the next two centuries right down to 1800, and an enormous impulse was given to production from 1600 to

Mr. R. L. Everett, M.P.

3 May 1894.

1700, improvements in agriculture went on so fast that the population of these islands was doubled—so Thorold Rogers says. And as the rise of prices proceeded, debts and taxes grew lighter, and it is conceded, I think, universally by historians and economists, that this great increase of the precious metals acted as a very great stimulus to industry throughout that long period.

18,795. (*Mr. Giffen.*) But you do not give us the exact dates and steps of the rise in prices?—I think we are safer on the broad ground than we are in the detail of a few years. I have one more quotation bearing on it. This is from Thorold Rogers' History of Agriculture and Prices. He says: "On an average wheat rose "134 per cent. between 1541 and 1583 over the prices "which had prevailed on an average of two and a half "centuries before, and between 1583 and 1702, 209 "per cent. more." I have here a quotation from Alison, from his History of Europe taken from the volume dealing with the period between 1815 and the rise of the second Napoleon, which is one of the most eloquent descriptions I know of of the effect of the great increase of the precious metals. He says: "The two greatest events that have occurred in "the history of mankind have been directly brought "about by a contraction and, on the other hand, an "expansion of the circulating medium of society. "The fall of the Roman Empire, so long ascribed, in "ignorance, to slavery, heathenism, and moral cor-"ruption, was in reality brought about by a decline in "the silver and gold mines of Spain and Greece. And, "as if Providence had intended to reveal in the clearest "manner the influence of this mighty agent on human "affairs, the resurrection of mankind from the ruin "which those causes had produced was owing to a "directly opposite set of agencies being put in opera-"tion. Columbus led the way in the career of re-"novation; when he spread his sails across the Atlantic "he bore mankind and its fortunes in his barque. The "annual supply of the precious metals for the use of "the globe was tripled; before a century had expired "the prices of every species of produce were quad-"rupled. The weight of debt and taxes insensibly wore "off under the influence of that prodigious increase. "In the renovation of industry the relations of society "were changed, the weight of feudalism cast off, the "rights of man established. Among the many con-"curring causes which conspired to bring about this "mighty consummation, the most important, though "hitherto the least observed, was the discovery of "Mexico and Peru. If the circulating medium of the "globe had remained stationary, or declining, as it "was from 1815 to 1849, from the effects of the South "American revolution and from English legislation, "the necessary result must have been that it would "have become altogether inadequate to the wants of "man; and not only would industry have been every-"where cramped, but the price of produce would have "universally and constantly fallen. Money would "have every day become more valuable; all other "articles measured in money less so; debt and taxes "would have been constantly increasing in weight and "oppression. The fate which crushed Rome in ancient, "and has all but crushed Great Britain in modern, "times would have been that of the whole family of "mankind. All these evils have been entirely obviated, "and the opposite set of blessings introduced, by the "opening of the great treasures of Nature in California "and Australia."

18,796. (*Mr. Chaplin.*) Have you anything to say upon the same subject at later periods?—Before I pass from that I should just like to say that, following on those great discoveries, there came an era of enormous national prosperity first in Spain, then in France, and then in England. As the precious metals kept spreading from country to country wherever the gold and silver flood came it brought fertility and a quickening of industry and a blessing to mankind in its course. The next great agricultural era in modern times, which it strikes me as important that the Commission should think upon, is the suspension of cash payments by this country in 1797.

Effect on prices of suspension of cash payments.

18,797. What, in your view, was the effect of the suspension of cash payments upon the agricultural condition?—I might say that when cash payments were suspended the paper money became the legal standard. Paper money was really a promise to pay the precious metals, but that was held in suspension, and the paper was made full legal tender; and as the notes were issued plentifully prices rose very high in England, and there was unparalleled prosperity in agriculture in this country down to 1814.

Mr. R. L. Everett, M.P.

3 May 1894.

18,798. That prosperity resulting, in your opinion, from an abundant supply of money?—Yes, which brought an increase of prices, which led to enclosures and the spread of cultivation, and gave an enormous stimulus to agricultural and other industries.

18,799. In those days did all the different classes connected with agriculture share in this improved condition?—I think it went more to the cultivator of the soil and to the owner of the soil than it did to the labourer. The labourer's employment increased, but his wages rather haltingly followed the upward movement of prices, I think. But employment was very abundant for the labourer through all those early years of the century.

18,800. Then there was a return to cash payments, I think, in the year 1819?—Yes, it was expected in 1815, because the law was that so many months after the conclusion of a general peace they were to be resumed, and after the conclusion of peace, after the battle of Waterloo, the apprehension of a near resuming of cash payments led to very great agricultural trouble; it led to a great fall of prices in 1816. Then the legislature suspended for two years further the return to cash payments, and immediately the agricultural pulse bounded into new life again through the years 1817 and 1818, but in 1819 the Act was actually passed to return to cash payments.

18,801. I gather that what you mean is this, that the effect of a threat of a return to cash payments in 1815 caused a fall in prices and general agricultural distress?—That was so.

18,802. That that distress, becoming very severe, the execution of that threat was postponed for two years; is that so?—That is so.

18,803. That was followed again by a period of comparative prosperity?—That was so in 1817 and 1818.

18,804. Then the proposal was finally carried out in 1819; is that so?—That is so.

18,805. What followed upon that?—A very great distress. Perhaps the Commission would kindly allow me to read an extract or two. I should like to read a short quotation from Mr. Western, afterwards Lord Western, an eminent agricultural representative of Essex in those days.

18,806. Just let me ask you first what was the precise effect then of the resumption of cash payments upon the volume of money?—It caused a great reduction in the volume of money and in credit.

18,807. And that was followed by circumstances which I understand you propose to describe by reading an extract; is that so?—Yes. Mr. Western says—this was spoken in 1816—"Between two and three years ago "agriculture was in a flourishing and prosperous state, "and yet, within the short period which has since "elapsed, thousands have been already ruined, and "destruction seems to impend over the property of all "those whose capital is engaged in the cultivation of "the soil." He said that in the debates on agricultural distress in 1816, that was when the return to cash payments was only expected, and before it was deferred.

18,808. Can you tell us what was the fall in prices which was occasioned at that time by the expectation of the resumption of cash payments?—No, I cannot. Prices in those times varied from month to month in a most extraordinary way, so that the average return for the whole year does not give at all an adequate idea of what was passing at the time.

18,809. But the general effect, I understand you to maintain, was a considerable fall in agricultural prices?—Yes, and very great distress. Alison says, in regard to that, "The sudden contraction of the cur-"rency from the prospect of a speedy resumption of "cash payments then involved one-half of the farmers "and traders of the United Kingdom in bankruptcy." That is referring to 1816. Then the merchants and bankers of the city of London in May 1819 presented a petition to the Houses of Parliament, from which this is a quotation—it was presented when the return to cash payments was in contemplation: "Your peti-"tioners have reason to apprehend that measures are "in contemplation with reference to the resumption "of cash payments by the Bank of England, which, in "the humble opinion of your petitioners, will tend to "a forced, precipitate, and highly injurious contraction "of the currency of the country. That the conse-

Mr. R. L. Everett, M.P.
3 May 1894.

" quences of such a contraction will be, as your " petitioners humbly conceive, to add to the burden " of the public debt, greatly to increase the pressure of " the taxes, to lower the value of all landed and com- " mercial property, seriously to affect and embarrass " both public and private credit, to embarrass and " reduce all the operations of agriculture, manufacture, " and commerce, and to throw out of employment, as " in 1816, a great proportion of the industrious and " labouring classes of the community."

18,810. What you desire to convey to the Commission I understand, then, is this: that there was a great contraction of the volume of money caused by the legislation which was adopted at that time, and that that contraction was followed by a period of the very greatest distress?—That is so; all historians of those times concur in that.

Inquiry into condition of agriculture in 1821-22.

18,811. About that period and during those years there were a great number of inquiries, I think, into the condition of agriculture, were there not?—There were. The first committee of inquiry which I have been able to learn of in the century was held in 1821 and 1822. It was presided over by Sir Thomas Gooch, who was a representative of the same county that I come from, the county of Suffolk. I should like if the Committee would allow me, to read two or three extracts from their report. First, here is what Mr. Attwood, who was a member of the House of Commons, said—I do not exactly know where I cut this out, but I cut it out of some printed book on money which came in my way some time ago. He says this: " I remem- " ber in April 1821, that I was examined before the " Agricultural Committee of the House of Commons. " They told me openly and publicly that they had " passed a resolution that they would not inquire into " the currency part of the question."

18,812. Who is that you are quoting?—Mr. Attwood. He was a banker, I think, of Birmingham, but he was a very frequent speaker through all the debates on agricultural distress in the first quarter of the century.

18,813. (*Mr. Giffen.*) And a bimetallist, I believe?—Yes; I think he had some belief in paper money as well.

18,814. But he was a bimetallist?—Yes. I have looked up the Report, but I cannot find this in it, no doubt they told the reporter not to put that down, but this is his own account of what passed between him and them when they examined him. " They told me " openly and publicly that they had passed a resolution " that they would not inquire into the currency part " of the question, and that I must confine my observa- " tions to the agricultural part of it. ' Good God,' said " I, ' gentlemen, what are you? Are you not a Com- " ' mittee appointed by the House of Commons to " ' inquire into the cause of the distress of agricul- " ' ture?' ' Certainly,' said they. ' And what is the " ' distress of agriculture? Is it not the low price of " ' agricultural produce?' ' Undoubtedly,' said they. " I rejoined, ' Is there any other distress in agriculture, " ' except the low price of agricultural produce?' " ' Certainly not.' ' What is the low price of agricul- " ' tural produce? Is it not the small quantity of " ' money or currency which agricultural produce " ' commands in the market?' ' Most certainly it is.' " ' Why, then,' said I, ' do you mean to say that you " ' have passed a resolution declaring that you will " ' not inquire into the very subject which you are " ' expressly appointed to inquire into?' I could get " no further answer to this."

18,815. (*Mr. Chaplin.*) I presume, then we may suppose that you are of opinion that the Agricultural Commission of 1894 is adopting a more proper course than the Committee of 1821?—A very much wiser course, but I believe the Committee of 1821 had their hands tied by a Resolution of Parliament that they would not go back upon what they had done in 1819. The Committee of 1821 and 1822 made two or three reports and were unanimous in their opinion that it was the fall in prices which had caused the trouble. They said, as regards any hope of cure for it from the corn laws or from protection which was suggested by some witnesses: " The ruinously low prices of agri- " cultural produce at this moment cannot be ascribed " to any deficiency in the protecting power of the law, " protection cannot be carried further than monopoly." At that time under the corn laws passed in 1815 no corn was admitted into this country until the price had reached 80*s.* a quarter. Then they refer to the change in the value of money though they had agreed apparently not to recommend any alteration in regard to that. They say, "Your Committee, however, cannot " but ascribe a proportion of the depression in prices " . . . to the measures which the restoration of our " currency had rendered necessary . . . an effect " which has been aggravated . . . by the endeavours " of other countries to revert to a metallic currency " simultaneously with ourselves. They deeply lament " the derangement which the fluctuations of the last " 10 years in the value of the currency had occasioned " in all the transactions of life, together with the in- " dividual loss and suffering unavoidably produced by " the return to a fixed standard." They also said, " The " departure from our ancient standard in proportion as " it was prejudicial to all creditors of money and per- " sons dependent on fixed incomes "—that is the adoption of the paper money standard in 1797—" was a " benefit to the active capitals of the country. And " the restoration of the standard in 1819 has been in " its turn proportionately disadvantageous to the pro- " ductive classes of the community, and also attended " with embarrassment to the landowner having mort- " gages and fixed charges to meet, fixed when land " bore a higher value in reference to the impaired value " of money."

Mr. R. L. Everett, M.P.
3 May 1894.

18,816. Have you anything further that you wish to say with regard to the Committee of 1821?—No; they made two or three reports, as I have said, but nothing that they did took any effect to benefit agriculture.

Course of prices between 1822 and 1833.

18,817. After 1821 there was still a prolonged period of depression, I think?—There was a little check put to it in 1823. In 1822 prices fell so low that the producing classes of the country seemed on the brink of universal ruin. Then Parliament prolonged the life of the small notes which were to have come in then for 10 years more; I mean the inconvertible one pound and two pound notes. Parliament passed the Small Notes Act, and under the influence of that, agriculture looked up again for the next few years.

18,818. (*Mr. Giffen.*) Were the small notes inconvertible?—Yes, I believe so. Then in 1825 there was a frightful crash of banks, and frightened by that the legislature passed another law shortening the 10 years which they had fixed for the small notes to run, and ordering that no more stamps should be issued for small notes after 1826, and that such notes as were out should come in finally in 1829. As Alison very tersely puts it: "As the notes came in the people went out." About 1829 there ensued again a frightful agricultural and industrial depression, which was so bad that by 1832 when the great Reform Bill was passed the country was on the brink of revolution.

18,819. (*Mr. Chaplin.*) Then there was another Committee appointed upon the subject of agricultural depression, which was still very severe in 1833, I think?—That is so, and that Committee was presided over by Sir James Graham.

Committee on Agricultural Depression, 1833.

18,820. Can you give us any information as to the proceedings of that Committee, or of any report that they made?—Yes, they reported, and amongst other things that they said in their report was this: " With " deep regret we express the fear that the difficulties " referred to by the former Committee alone remain " unchanged." They said that the farmers' savings are gone, or greatly diminished; their credit failing, and their resources generally exhausted. They went on to say: "Less labour and capital are being applied " to the soil. Ancient corn lands, especially clay " lands, are going out of cultivation. This arises from " low prices and inadequate profit of cultivation." They agreed with the Committee of 1821 as to the effect of the currency changes, and referred to the decay of yeomen farmers, which they considered due to the fall in prices and to the altered value of money.

18,820*a*. Do I understand you that that Committee were agreed as to the effects of the currency?—Yes, this is from their report, which they, I think, were unanimous in. They quoted from the report of the Committee of 1821 their remarks as to the cruel effects of first the depreciation of money in the paper money era, and after of its appreciation when we returned to cash payments, and pleaded for the desirability of steadiness in price. They said: "Fresh experiments " in the value of money must affect the price of agri- " cultural produce, shake public confidence, and lead " to the derangement of all settled contracts, and they " ought, after past experience, to be viewed by the " legislature with peculiar caution."

Mr. R. L. Everett, M.P.
3 May 1894.

18,821. Did the Committee of 1833 make any recommendations in their report with a view to arrest the fall in prices?—No, I cannot find that they did. In the evidence laid before them the Act of 1819 was referred to again and again as, in the opinion of (I think I may say) the most competent witnesses—banking witnesses and most intelligent agricultural witnesses,—having been the main cause of the fall in prices and of the trouble, both agricultural and manufacturing. But they made no recommendation in regard to the money changes, because Parliament had again affirmed that it would not go back upon what it had done.

18,822. Then I understand you to say that the effect of their report was this—they attributed the distress at that time to changes which had been made in the currency, but they made no recommendation for their alteration because Parliament was pledged against any such action?—That is so.

18,823. Have you anything further to say with regard to the Committee of 1833?—No.

Committees on Agricultural Depression of 1836 and 1837.

18,824. Then there was another committee on agricultural depression appointed in 1836?—That is so. It was a most influential committee, and was presided over by Mr. Shaw Lefevre. It included Sir Robert Peel, Lord John Russell, Sir James Graham, Lord Stanley, and many other prominent statesmen. It took a great body of evidence, but it did not agree to a report. The Chairman prepared a report, but the Committee could not agree on it. The general effect of the testimony given before it was, that the distress continued to increase, and a good many of the witnesses examined before them, connected that distress with the continued low prices, and the low prices they directly connected with the return to cash payments. I have quotations from a number of them before me.

18,825. No report was agreed to, I understand, by this Committee, and no report was presented?—That is so.

18,826. Do you know for how long a period they sat?—No, I do not; but there is a very great bulk of evidence that was laid before them.

18,827. Are you in a position to say what was the character of that evidence?—I have several extracts here under my eye. John Langhorn, a banker of Berwick-on-Tweed, for instance, said, "No relief would "be afforded to the farmer, except through the re-"laxation of the currency. The distress of 1816 was "removed by increased issues."

18,828. (*Chairman.*) There being no report, I do not think we can take extracts from the evidence, as there may have been other evidence in an opposite direction?—Very good.

18,829. (*Mr. Channing.*) This evidence is printed, of course, so that we may refer to it if we wish?—Yes.

18,830. (*Mr. Chaplin.*) Are you in a position to say, from your acquaintance with this evidence, that, in your opinion, the drift of it would be to the effect that the depression was due to currency causes?—A great many of the most competent witnesses, such, for instance, as Mr. Baring, afterwards Lord Ashburton, Mr. Richard Spooner, a banker, Mr. Pattison, a Governor of the Bank of England, the Earl of Radnor, and Mr. E. S. Cayley, M.P. for Yorkshire, gave evidence to the effect that that was the key to the fall in prices and the difficulties.

18,831. But notwithstanding all this evidence, the Committee came to no understanding as to reform?—No.

18,832. And no report was made?—Of course, they could not report upon making any change in the monetary system, because Parliament had three times over affirmed that it would not go back on what it had done.

18,833. (*Chairman.*) Do you recollect that when the Committee was moved for there was read out by the clerks at the table a previous resolution of the House of Commons, I think in the previous session, on the subject of the currency, indicating therefore that the Committee was not to enquire into the question of the currency?—The method in those days seemed to have been: petitions came to the House of Commons bearing upon agricultural distress: then a Committee was appointed to which these petitions were referred.

18,834. I think it was the understanding on both sides that the Committee should not make any recommendations upon the subject of currency?—Yes.

Mr. R. L. Everett, M.P.
3 May 1894.

18,835. (*Mr. Giffen.*) But, as a matter of fact, a good deal of evidence about currency was given before that Committee of 1836?—That is so. Also in the debates in the first Parliament elected under the great Reform Bill, the subject was discussed on a motion of the member for Essex, I think, and the famous William Cobbett spoke upon it, and expressed a very strong opinion that the troubles of the country were owing to the change in the standard.

18,836. (*Mr. Chaplin.*) Did I understand you to say that on this Committee a report was prepared by the Chairman?—Yes,

18,837. Is there a record of it?—I think not; I have not discovered it in my researches.

18,838. Because that would be very interesting?—Yes, it would.

18,839. You are not able to say that there is such a report in existence?—No, I am not. I know that in those times, as now, there were two sides taken; there was a certain class of witnesses who were blind to the fact (if I may be permitted to use the expression) that changes in the value of money do affect prices; they were not able to see that. There was another class who had more direct connexion with money matters, who were very emphatic that it was the key that governed the general level of prices.

18,840. Then the Committee of 1836, having failed to come to any conclusion, a Committee was appointed in the following year on the same subject in the House of Lords?—That is so.

18,841. What occurred on that Committee?—That also did not report; but evidence to the same effect was laid plentifully before their Lordships.

18,842. Is the fact of these committees coming to no conclusion and making no reports to be attributed to this, that Parliament had determined not to alter the standard, and had made public its declaration?—I think that they could see no other measures within the competency of Parliament which in their opinion would have a material effect on agricultural conditions. They already enjoyed protection of a very extreme kind, if you can call it enjoying it. I imagine that is why they did not report.

18,843. Then am I right in this, that, assuming them to have agreed that alterations in the currency might prove to be the remedy, that remedy was not open to them, because of the attitude of Parliament?—That is distinctly so.

18,844. (*Chairman.*) Was it not also the fact that the depression was very much abated by the time the Committee came to the conclusion of its labours?—I think not. I think in 1833 they reported that it was decidedly worse than in 1821.

Statements made in 1830-35 as to effect of currency changes on prices.

18,845. But in 1836 what was the fact?—In 1836 and in 1837 the evidence is full of the distressed condition of the industry. I do not think there had been any abatement in the condition. I have before me a number of extracts from the speeches of great men both in the House of Lords and in the House of Commons made on agriculture during the period which we have had under review. For instance, Earl Stanhope said in 1830 in the House of Lords: "To what is the uni-"versal distress owing? It is to be ascribed to the "erroneous basis on which our currency has been placed "since 1819. Prices have not fallen in agricultural "produce only; the depression has been continuous "and universal ever since the Act of 1819 passed, and "especially since the suppression of small notes took "effect in the beginning of last year. Such a universal "and continued depression can be described only to "some cause pressing alike upon all branches of in-"dustry, and that cause is to be found in the enormous "contraction of the currency which has taken place." Sir James Graham, in 1820, on a motion to forbid the circulation of Scotch £1 notes in England, said: "The "gentlemen opposite had contrived to reduce the price "of corn lower than it had been since the Revolution. "The miracle was produced by a very simple process, "namely, that of tampering with the currency, from "which the landlord is sure to be the first to suffer. "The value of money was heavily increased, while all "contracts remained at their nominal amount. The "change bore down the amount of the landlord's re-"ceipt for his produce, while all the fixed charges "and incumbrances on his estate were increased. "He was forced to pay in a currency 30 per "cent. higher than that in which he had borrowed

Mr. R. L. Everett, M.P.

3 May 1894.

" and the consequence was that he must retrench, aban-
" don the hospitality and liberality of his ancestors, and
" live like a niggard and degraded man, and squeeze his
" tenants like an oppressor, or the monied man walked
" in and took possession. A decrease in the quantity
" of money is the first step in the high road to ruin."
Mr. Western said, in a debate in 1830: "It is to the
" change in the currency that we are to attribute
" our distress." In the same debate Mr. Hudson
Gurney said: "To me it does seem perfectly clear
" that the one and only source of all our difficulties, and
" of all the distresses that press so large a portion
" of our population to the earth, is the affair of money—
" the great and inconceivable error of making gold
" their only standard." Mr. Attwood said: "The con-
" duct of the Government respecting the currency had
" operated as a confiscation of the property of the
" landed man for benefit of the monied man." Sir Francis
Burdett spoke of: "The fatal Bill of 1819. Subse-
" quently, to that measure there was a motion for a com-
" mittee by the hon. member for Suffolk (Sir T. Gooch)
" which was obtained, and a partial relief was obtained,
" for the existing distress by the issue of £1 notes."
"He mocked at the worship of the golden idol,"
and also said: "They sacrificed the agricultural
" interest, the shipping interest, and the commercial
" interest to the public creditor, to place-men and
" to pensioners." William Cobbett said: "The real
" cause of all the agricultural difficulties of England
" was the change which had taken place in the
" value of money. Therein lay the true source of the
" national misfortunes. The original moving power
" by which their distress had been occasioned was the
" well-known currency measure of the right hon.
" baronet, Sir R. Peel, near him." Mr. Benett said:
" I agree with Mr. Western that the cause of the
" agricultural distress, and the sources of relief must
" be sought for in the currency question." Daniel
O'Connell said: "There is such a place as Ireland:
" agricultural distress is as great, if not greater, in
" that country than in England. They have been during
" the debate wholly forgotten. The remedy proposed
" by the noble Lord (relief of taxation) is only like
" clipping or paring the thorn in the field. One remedy—
" the only sure remedy—has been passed over—namely,
" one that would have the effect of mitigating the
" horrors of the Gold Currency Bill. If no one else
" will, I will put in my claim for that scheme, which is
" better than all the other schemes I have heard this
" night proposed." On Mr. Canley's motion for a silver
standard on June 1st, 1835. O'Connell also said: "A
" more destructive Bill—a more iniquitous Bill, than
" that of 1819 has never been introduced. There never
" has been a Bill more fatal to this country or so fatal
" to Ireland. There is no pressing necessity for that
" measure. It appears to me to have been concocted
" in insanity, and for no other purpose than to make
" a mighty experiment on the power of human suffering
" to see what weight it would bear. I remember
" persons having valuable interests in land leased to
" others who had also interests, and all were swept
" from the face of the land by the effect of that Bill
" as by a plague or pestilence. The monied interest
" has a strong motive for upholding the present
" system." Mr. Wodehouse said: "All other reme-
" dies will prove utterly ineffectual. I have been
" one of the Committee who sat in 1822 upon
" agricultural distress, and I have been one of a
" small minority who were opposed to the adoption
" of their Report on the ground put forward by
" Mr. Huskisson, that it did not sufficiently take
" into account the altered value of money. I
" am convinced that the present state of the currency
" has already done incalculable mischief, particularly
" to those connected with agriculture, and still threa-
" tens to overwhelm them with immeasurable ruin."
Sir Robert Peel, while he did not go nearly so far as
the others, said:—"That the Bill did increase the dis-
" tress of the country to a certain degree I do not
" deny. It is impossible to escape . . . After
" 20 years of . . . . Inconvertible paper . . .
" Without. By depreciating the standard the prices
" of all commodities would be raised." In a de-
bate on the Corn Laws in 1843 Lord John Russell
said:—"In 1815 a new policy was adopted, and
" 80*s.* was established as the price at which foreign
" corn might be admitted. An important change,
" however, occurred in 1819, which really affected the
" price of corn. The attempt to keep up the price of
" corn at 80*s.* entirely failed; for the Right Hon.
" Baronet, in 1819, introduced a change in the currency
" and restored the standard of value. What was the
" effect? Why, five years before 1820, wheat averaged
" 80*s.* 9*d.*, while in five years after 1820 it averaged
" only 57*s.* 3*d.* It was not any alteration in the Corn
" Laws that produced the alteration in price; it was
" the change in the monetary system."

Mr. R. L. Everett, M.P.

3 May 1894.

18,846. (*Mr. Chaplin.*) Then do I understand your view to be this: that what you want to convey to the Commission is that all these repeated inquiries were rendered useless because the Commissions and Committees were debarred from making recommendations with regard to the currency?—That certainly is the opinion that I have formed. The real root and seat of the disease they were forbidden to touch, and consequently any recommendations that they could make were no more than clipping the hair or paring the nails of a patient who is bleeding to death from a ghastly wound.

Condition of agriculture in 1837–46.

18,847. After those Committees, ending with the Committee of the House of Lords in 1837 had been closed, what was the position of the agricultural interest in the following years?—I think after 1837 it gradually ameliorated; that is, things accommodated themselves to the altered value of money down to the time when the Corn Laws were repealed in 1846. On the whole after 1837—between that year and 1846—the agricultural distress lessened, I think, owing to a general accommodation of charges and rents and wages, and so forth, to the gold standard.

18,848. Matters, in fact, had generally adjusted themselves to the new condition of affairs during the years between 1837 and 1846?—I think so. There was no further inquiry into agricultural trouble in those years.

18,849. Then in 1846 the Corn Laws were repealed?—They were.

Effect of repeal of corn laws on prices.

18,850. What was the immediate effect of the repeal of those laws?—The immediate effect for a few years was a heavy fall in prices. The agricultural literature of that time is full of predictions of the calamities that would overtake the agricultural classes; how land would go out of cultivation, and the labourers would be driven off the land, and the landlords ruined. The whole country was filled with the fears of the agricultural classes at that time.

18,851. (*Mr. Giffen.*) Had you not rather high prices in one or two years between 1846 and 1850?—I think only in 1846 itself, if I remember aright. There was a sudden very sharp rise either in 1846, or 1847.

18,852. 1847, I think it was?—I am just old enough to remember it; it did not last long.

18,853. (*Mr. Chaplin.*) However, the fall that you are now speaking of, and the fears and the trouble that widely prevailed in agricultural circles were all attributed at that time to the passing of the legislation of 1846, that is to the repeal of the Corn Laws?—Undoubtedly to the repeal of the Corn Laws.

18,854. How long did that period of alarm and anxiety continue?—Till about 1852 or 1853.

Condition of agriculture 1852–1879.

18,855. Then did it disappear?—Then we entered upon an era of higher prices, and right away for the next 25 years, on the whole, we had a period of agricultural prosperity of longer continuance and steadier continuance than any period recorded in this present century. At the end of it, about 1879, English agriculture was the pride of the whole world and the desire of every occupier of land was to compete with his neighbour to try and make the earth yield more than they were making it yield. The farmers' profits were rising, the landlord's rent was going up and wages and employment were going up.

18,856. It might be said, I suppose, without exaggeration that in the years immediately previous to 1879, agriculture had reached the summit of prosperity in this country?—Yes, the highest level of prosperity that there is any record of, I think.

18,857. Rents had risen very considerably, I think?—Very considerably.

18,858. And farmers' profits were very large?—At any rate they were quite 10 per cent., taking one year with another.

18,859. And the wages of agricultural labourers were high?—They rose gradually. In the early part of the rise in prices the agricultural labourer was very severely punished. His wages did not go up proportionately; but as the period continued and developed the movement of wages followed in its track.

Mr. R. L. Everett, M.P.
3 May 1894.

18,860. (*Chairman.*) When do you consider the movement in the rise of wages began?—In the sixties, I think. I think the fifties were very hard times for agricultural labourers; in the sixties their condition ameliorated, and early in the seventies their money wages, in our part of England, had reached their maximum.

18,861. (*Mr. Chaplin.*) When?—In 1870; I think it was in the year 1870 when the great strike was in the eastern counties.

Wages in 1870 and 1879 compared.

18,862. What were the wages paid in your part of the country?—For an ordinary day labourer 13*s.*, and for a head horseman 15*s.*

18,863. And what would be the wages to-day?—The 13*s.* has gone down to 11*s.*, and 10*s.* in most cases now. I myself pay 12*s.*, but I am just on the edge of a flourishing town. The ordinary rate in the interior has gone down from 13*s.* to 10*s.*

Effect of gold discoveries of 1847-50 on prices.

18,864. Now, will you tell us to what causes you attribute that great period of prosperity?—My opinion, comparing recent history with past history, is that the alteration in prices was mainly due to the unprecedented discoveries of the precious metal, the wonderful discoveries of gold, first in California and after in Australia.

18,865. The discoveries in California commenced, I think, in 1847?—They did, and in Australia in 1850. The production of gold increased from an average of two millions a year in the first 14 years of the century to an average of 27 millions a year during the 20 years between 1850 and 1870. That is what the Gold and Silver Commission state.

18,866. An average of how much—27 millions did you say?—27 millions a year it averaged for the 20 years between 1850 and 1870, and it rose to that from a production in the early part of the century of only two millions a year—that is a 13-fold increase. It was the most amazing addition to the stock of the precious metals of the world that mankind has ever had; it exceeded the discoveries in America in the earlier centuries.

18,867. (*Mr. Lambert.*) For how many years was that?—For 20 years; in 20 years the quantity of gold in the possession of mankind from the foundation of the world was doubled—in one 20 years.

18,868. What were the years?—From 1850 to 1870.

18,869. (*Mr. Chaplin.*) What was the production in the years immediately previous to 1850; are you in a position to give us that?—I believe it increased eightfold, but I have not those figures before me.

18,870. You stated that the production was two millions a year for the first 14 years of the century, why do you take those particular years?—Because I copied them from the Gold and Silver Commission Report.

18,871. They do not give the other years, do they?—I fancy they do; but I did not light upon it in my looking through it.

18,872. You had no special reason for selecting those?—Not at all.

18,873. (*Mr. Giffen.*) The production in the forties was about eight million on the average, was it not?—Was it as much as that?

18,874. The production from Siberia, I believe, was about five millions, and that commenced a little before 1840?—I have not those figures before me at the moment.

18,875. (*Mr. Chaplin.*) This great production of gold between 1830 and 1870 was accompanied by a very considerable movement in general prices, I think?—It was so in the wholesale prices of all commodities; it was a very remarkable upward movement. The popular idea, when we entered upon the era of free trade was, that we were going to enter upon an era of cheapness and plenty. As a matter of fact, after a few years, we entered upon rising prices instead of falling prices, but with the rising prices we also had wonderful and unprecedented prosperity, which was felt not only in free-trade countries like England, but in protectionist countries on the Continent.

18,876. And that prosperity was not confined, I think, by any means, to agriculture, was it?—Oh, dear no. Our industries generally had the best time in the 20 odd years from 1850 to 1873 that has ever been known. I have here what I happened accidentally to light upon, an interesting prophecy of Sir Fitzroy Kelly's, who at that time in 1859 sat for East Suffolk, and was president of the Ipswich Farmers' Club. I happened to turn up the report of the speech he made the year he was our president, and in that speech I find that he said this: "I am now, perhaps, addressing "more tenants than landlords, and if there were one "piece of advice upon such a subject I should presume "to give you, it would be that during the next four or "five years, whoever is entering upon the relation of "tenant, that he should endeavour even at some "increased rent—even though bound by some contract "he may not altogether approve—to obtain *as long a "lease as possible* at whatever is considered a fair rent "of the day. The immense influx of gold into this "country is such that it must before very long have the "effect of lowering the value of gold, of money, and "consequently of enhancing and increasing the value "of every commodity which money will purchase . . . "With this immense influx of gold, which during the "last 10 or 12 years exceeded that received during the "first 100 years after the discovery of America, it is "only because silver has not fallen in proportion, "because it has not increased in proportion, silver still "existing in its original quantity and so counter-"balancing the effect of gold that the effect has not "been felt now. But be assured that a man who can "obtain a lease now say for 14 years at his present "rent, will find when his term is half at an end he is "paying a rent quite inadequate to the additional "value the land and its produce will have acquired "by reason of the fall in the value of gold. There-"fore, addressing as I am tenant farmers and persons "likely to take leases rather than to grant them, I "can only say if you are fortunate enough to obtain a "lease for 12 or 14 years at the present rent you will "be very fortunate, and will do more for yourself "than you would by some benefit conferred upon the "land."

Mr. R. L. Everett, M.P.
3 May 1894.

18,877. (*Chairman.*) Did many of them follow his advice?—Yes, everybody's desire in those happy days was to obtain as long a lease as he could.

18,878. (*Mr. Chaplin.*) What was the date of that statement?—It was in 1859 that Sir Fitzroy Kelly made that speech.

18,879. Have you anything further you would like to say with regard to that period between 1850 and 1870?—No, I think not.

Wages of labourers in Suffolk in 1871, 1881, and 1892.

18,880. (*Chairman.*) Before you go on let me ask one question with regard to wages. I see in the analysis which Mr. Giffen handed in of the wages of agricultural labourers, as reported by the Commission on Labour, it is stated that the wages in Suffolk in 1871 were 10*s.* to 12*s.*; in 1881 12*s.* to 13*s.*; and in 1892 12*s.* That does not quite coincide with what you said?—That does not correspond with my experience.

18,881. I think you said they had fallen from 13*s.* to 10*s.*?—Yes, they have fallen in this present year in many cases 2*s.*—in nearly all cases 1*s.* That is not included in Mr. Giffen's figures.

18,882. Whatever the fall this last winter may have been, will that not prove to be of a temporary character?—I do not think it is at all likely to be of a temporary character judging from the condition of the employers.

18,883. (*Mr. Little.*) May I say that the figures for 1871 appear to be based upon the report of the Commission on the Employment of Children and Young Persons. By the figures that I have before me in Mr. Wilson Fox's report it appears that the wages in 1870 were about 10*s.*, and that they rose after 1870 very rapidly and that 1872 was the time of the great rise?—The great strike in the eastern counties in which Joseph Arch came into so much prominence, I think, was in 1870 or 1871. I know that I was paying 13*s.* at the time and never went higher.

18,884. I think the great rise was a little later, will you look at this return (*handing return to witness*)?—You have got 13*s.* in 1872 there, I see at Thetford; we should probably pay more on the outskirts of Ipswich.

18,885. That would account partly for the discrepancy between these accounts?—Yes.

Condition of agriculture since 1879.

18,886. (*Mr. Chaplin.*) Then this period of agricultural prosperity continued, I think you said, until the year 1879?—Yes, that is so.

18,887. Since then there has been a very important and remarkable change in its condition?—Alas! there has, it has been continuously getting worse.

Mr. R. L. Everett, M.P.

3 May 1894.

Effect of demonetisation of silver on prices.

18,888. What do you attribute that change to?—1879 itself was a disastrous year in weather—a very wet year, and that, unfortunately, confused causes in people's minds, but I believe myself that the change in the level of prices which began to develop itself about then was owing to the legislation against one of the two precious metals which had commenced in 1872, and which was of the nature of protection to the remaining metal left free. The supply of money to the world had come freely from gold and silver, and then one nation after another began to protect the money-lenders' gold by excluding the old free competition of silver.

18,889. When did this legislation begin?—It began in Germany; it had begun in England as long ago as 1816, but it took no kind of effect then, because there were other nations which had their mints open without limit to both the two precious metals, and kept them free and in full circulation on a par with one another.

18,890. (*Mr. Lambert.*) What was the legislation in England that closed the mints?—Previous to 1816, and previous to our going back to paper money in 1797 the old standard of England had been silver, but gold had also been allowed to be coined without limit, and was legal tender without limit at a ratio prescribed by the mint indentures. Anyone was at liberty to carry his gold or silver to the mint and have it back again in coin, and with the coin of either metal he could discharge his debts without limit. But in 1816 an Act was passed for a new silver coinage in England, the object of which was to make gold our standard instead of silver, and to put the control of the minting of silver into the hands of the Government of the day. The particular object of that measure also was to keep silver coin in the country, for at that time it was to the interest of people to take silver out of England as they could make more of it elsewhere, and consequently small change was very scarce. Under this Act they debased the silver coin, and then the proposer of it said that possibly the debasing of it would lead to filling England with the debased silver instead of the gold. Therefore, he recommended that the Government of the day should have power, if they saw that was coming to pass, to close the mint against the silver.

18,891. Did they close the mint?—Yes, practically from that day on the coining of silver has been kept in the hands of the Government, but the right of any subject of England to bring silver to the mint to be coined into coin of the realm still remained upon the Statute Book, although a Royal proclamation was necessary before it took effect. As you have noticed when a new coin is issued now, there is a Royal proclamation which precedes its issue. Down from 1816 to 1870 a Royal proclamation could at any time have revived the old right of the subject in England to the free coinage of his silver as well as of his gold.

18,892. As a matter of fact, was there a great limitation in the coinage of silver?—Yes; they simply had enough coined for the convenience of small change.

18,893. (*Mr. Giffen.*) Was there any coinage of silver in England to speak of during the last century?—I believe there was not a large coinage.

18,894. It was very small indeed?—Yes. The rate at which the two metals were accepted in the Government Treasury and by the Mint Indentures made gold really the cheaper metal.

18,895. So that England had ceased to be a consumer of silver for monetary purposes from the beginning of the last century, as a matter of fact?—Yes. England was filled with the cheaper metal which at the ratio then prevailing was gold. It paid to take silver out of England and sell it in other countries.

Prohibition of free coinage of silver in England.

18,896. The free coinage of silver was absolutely forbidden in 1798, was it not?—No; I think not.

18,897. There was an Act passed in that year, was there not?—It has not come under my observation if there was. The legal tender of silver coin was restricted to 25*l.* by tale by an Act somewhere about that time, or a little earlier, I think.

18,898. In 1780?—The silver still remained legal tender to any amount.

18,899. But the free coinage of silver was absolutely prohibited in 1798, I believe?—If so, it was only a very temporary provision.

18,900. (*Mr. Chaplin.*) Were not the mints open to the free coinage of silver immediately prior to 1816?—I believe so, and silver was the standard with gold rated to it. Curiously in 1870 Mr. Lowe was Chancellor of the Exchequer, and carried an Act through the House for the consolidation of our coinage laws, and in the passing of that Act he omitted carrying over the clause dating from the time of Charles II., 1666, under which the right of free coinage of silver had been given to the subject; he omitted that, so that after 1870 a Royal Proclamation was not sufficient to enable the subject to bring his silver to the mint. Before he died, Mr. Lowe expressed to the late Colonel Tomline, I believe, his opinion that he had made a mistake.

Mr. R. L. Everett, M.P.

3 May 1894.

18,901. However, to the best of your knowledge, a gold standard was adopted by legislation in this country in 1816, and at the same time the mints were closed to the free coinage of silver?—Yes.

18,902. But you contend that that had no effect upon the monetary situation as regards the change in prices, because the mints of a great number of other countries were still open to the free coinage of silver, and in that way the parity of value was maintained between the metals just the same?—That is a historical, undeniable fact, I think.

Demonetisation of silver in 189

18,903. Then the next change was the change in 1872, I understand you to say?—Yes. The change which really affected the comparative value of the two precious metals was begun by Germany, I think it was in 1872.

18,904. (*Mr. Giffen.*) The actual withdrawal of gold commenced in 1871, I think?—Either 1871 or 1872.

18,905. (*Mr. Chaplin.*) And that was followed by action on the part of other countries?—Yes.

18,906. Which countries were they?—The United States was the next to follow suit. In all the past history of the United States gold and silver had been equally full legal tender, and their mints stood open to the unlimited coinage of both, but in an Act for the consolidation of the coinage passed in America in 1873 the two words "silver dollar" were left out in enumerating the coins which might be coined, and in a few words, I think passed the next year, the legal tender of silver was limited to 40*s.*, as in England. Many people believe that those changes were made by inadvertence.

18,907. It is a fact, I think, that there is some ground for believing that this Act was passed without its being understood, and without any knowledge of what its effects would be on the part of a great number of members of Parliament?—That is so.

18,908. Then the legislation in the United States on this question was followed by changes in France, I think?—Yes, by the closing of the mints against silver in France.

18,909. What were the consequences of that legislation in France?—Then there remained no nation in which gold and silver were both full legal tender, in which the mints stood open to both, and that tie which had held the two metals at a steady level from the beginning of the century was snapped, and henceforth silver and gold became two entirely separate things, each going its own course.

18,910. And from the period of those changes there has been a steady decline in prices, has there not?—Yes, there has. The effect of those changes was greatly to increase the demand for gold, and at the very time that the fresh demand arose the annual supplies were falling off, and the joint effect of the two movements was that gold steadily began to mount up in value, that movement showing itself in a general fall of wholesale prices.

18,911. Subsequently to the years 1873 and 1874 there had been further demands made upon gold by other countries, I think?—Yes, Italy followed and Austria-Hungary, and now recently what we are proposing to do in India if it is really carried out will involve further new demands on gold.

Increased demand for gold.

18,912. What do you contend has been the effect upon gold of this legislation in all these different countries?—Like any other commodity a greatly increased demand coincident with a decreased supply has greatly raised its value and in countries that measure prices by gold the natural and inevitable effect has been that prices have continually fallen.

18,913. This being a gold-standard country and prices having fallen, you attribute, then, I understand, some part at all events of the agricultural depression to these monetary changes?—By far the larger part, I think.

Mr. R. L. Everett, M.P.
3 May 1894.

All gold-standard countries to-day are seeing their agriculture in ruins and the value of their produce and the land itself continually depreciating. Take our Colonies, European countries, Great Britain, Ireland, and the United States of America; agriculture is almost in ruins in all of them and the people who have lent money on security based upon agricultural produce or land have seen the value of their property steadily dwindling away.

18,914. That being the condition at the present time in gold-standard countries how does it compare with the condition of agriculture in countries which have a silver standard?—Countries which have a silver standard have escaped all the calamities which have fallen upon us. Their prices have been maintained substantially steady and there has been no unusual suffering among the agricultural classes. That is the case in China, India, and in Mexico, and in all silver-using countries.

Agriculture in countries with depreciated paper currencies.

18,915. Have you anything to say in connexion with this subject with regard to countries with depreciated paper currencies?—They, I believe, are the only countries to-day in which agriculture is vigorously going forward. In the Argentine Republic the cultivation of the land is increasing very rapidly. The agricultural implement manufacturers in my county have been very busy this last year making agricultural machinery of all kinds to send over there.

18,916. (*Mr. Giffen.*) Is that so of Russia?—I really do not know much about Russia. I know that Ransomes and Sims, the great agricultural engineers with us, do a great deal with Russia. My impression is that in Russia agriculture has not suffered nearly to the extent that it has in Western Europe.

18,917. But it has suffered a great deal?—I am not competent to give evidence about Russia.

18,918. (*Mr. Chaplin.*) It is the case in Russia, I think, that within the last year or two—I forget the exact date—they have suffered fearfully from famine?—Yes, or the weather.

18,919. Vast areas of the country failed altogether in their crops owing to climatic causes, did they not?—Yes, owing to frost or something of that kind.

18,920. (*Mr. Giffen.*) But they have also suffered from the low prices, have they not?—I do not know to what extent that has acted also. Russia is a silver-standard country, but in practice uses paper, I believe.

18,921. That is so, but, as a matter of fact, I believe the Government have had to take special measures for the protection of agriculture against the low prices to enable the people to hold out for better prices; but you are not aware of the circumstances of Russia?—No, I am not. I know that the consular reports from Mexico, and the reports that come to us from India give the impression that those two countries have maintained a steady level of agricultural conditions.

Degree of appreciation of gold.

18,922. (*Mr. Chaplin.*) Now can you give us any opinion as to the extent to which the value of gold has been raised by the monetary changes?—Yes, if the purchasing power of an ounce of gold is compared now with what it was 20 years ago, as measured by the wholesale prices of commodities generally, it will be found that gold has risen in purchasing power something like 50 per cent!

18,923. (*Mr. Giffen.*) 50 per cent.?—Yes. Where it took 100 ounces of gold to buy a certain quantity of produce, now a little over 60 ounces will buy the same quantity. The prices of commodities have altered, I think, between 30 and 40 per cent., but gold has risen 50 per cent.

18,924. (*Chairman.*) Do you mean measured in silver or measured by what?—Measured by commodities.

18,925. How do you take your commodities?—There are two or three lists of them. Those are the "Economist" index numbers based in 22 articles, and then there are Sauerbeck's tables based on 45 leading commodities.

18,926. That is on the assumption that those commodities are all in equal demand?—No. Mr. Giffen knows more than I do how those statistical tables are compiled, but all the different lists, I think, bring out substantially the same result.

18,927. (*Mr. Giffen.*) Still they are all based upon the assumption that each article is of equal value; that they all enter into the general average of prices to the same extent. But as a matter of fact, have there not been investigations showing that much the same result would have been produced if you had allowed for the different quantities into which these articles enter into consumption? Mr. Edgeworth has made investigations of that kind, has he not?—I have not seen them. Saurbeck's 45 leading commodities and the "Economist's" 22, both show that taking the average of the years 1865 to 1869 as your starting point, you can buy now with 66 ounces of gold as much as you could then with 100 ounces.

Mr. R. L. Everett, M.P.
3 May 1894.

18,928. (*Chairman.*) 66?—Yes.

18,929. That is not 50 per cent.?—Yes, it is, or thereabouts. Add 50 per cent. to 66, that is, add 33, and that makes 99.

18,930 I thought you said the reduction was 50 per cent.?—Yes.

18,931. You are putting it the other way which is very different; the reduction from 100 to 66 is not 50 per cent.; the decline is only a reduction of 34 per cent. Of course, if you put it the other way, comparing the present price with the former price, then you may say it is 50 per cent. above the present, but that is not the true way of putting it. When you speak of the decline of prices according to your own statement, the decline has only been 34 per cent.?—Yes; but that is because you take it that way.

18,932. When you speak of the decline of prices and the appreciation of gold, you must put your proposition in that form, must you not?—Yes.

18,933. And it is only 34 per cent., is it not so?—66 ounces of gold will buy as much now as 100 ounces would in the earlier years.

18,934. Does that not show, then, that the depreciation has been 34 per cent., and not 50 per cent.?—Yes; I think that is so, taking it that way. But those are the substantial facts. If you apply the same tables to silver, you will find that the purchasing power of silver has stood steady substantially. It increased through most of the period referred to, instead of depreciating as people would ordinarily have supposed, but it has a little depreciated in these last two or three years.

18,935. (*Mr. Giffen.*) That is to say, silver has fallen more than commodities in general during the last two or three years?—The diagram which I have had put up shows the movements of silver, of commodities, and of wheat by three different coloured lines which I respectfully submit show so remarkable a similarity that it is almost impossible to believe other than that they are all the result of the same cause, and that the rise in the value of gold explains them all. They measure in three different ways the extent by which gold has risen.

Fall in price of wheat.

18,936. Is there not something exceptional in wheat?—Yes wheat has fallen rather more.

18,937. A good deal more?—Yes. I think that is partly because wheat comes from silver-using countries and depreciated paper money countries probably more than the average of commodities come.

18,938. And the fall is not quite uniform; I observe that according to that between 1880 and 1887 the fall in commodities was much more than the fall in silver?—Yes, but the main outlines are parallel.

Fall in price of silver and commodities compared.

18,939. That is to say, at certain distant dates. You find them to be parallel, but they are not parallel all the way through?—No, not exactly. I have here a table which was contained in a paper read before the Society of Arts by Mr. Ban Robertson on January 19, 1893, which shows the parallel movements of silver, measured by gold and commodities (*handing in the table, see* Appendix).

18,940. (*Mr. Chaplin.*) Which is the silver, the dotted line?—I forget which line is which, but they are both almost exactly parallel.

18,941. (*Mr. Giffen.*) When you say commodities you mean that particular group of commodities, do you not?—Yes. In the diagram I have had put up the line representing the commodities represents the index number of the "Economist."

18,942. It would not be quite the same if you took Mr. Sauerbeck's number?—No, but it would be substantially the same.

18,943. And it would not be the same if you took Mr. Soetbeer's number?—Not exactly the same, but in all of them the main fluctuations would be the same.

18,944. With exceptions?—Yes. They do not fall in the same week or the same month.

18,945. Or the same year even?—The general movement is so exactly similar that I find it very hard to believe that they do not proceed from a common cause.

18,946. (*Chairman.*) There is a very complete parallel between them on that table which you have handed in?—Yes, that is very striking. Where those two crosses are is 1873.

18,947. (*Mr. Lambert.*) It is a very curious coincidence, is it not?—Yes. What I contend is that the fall in silver is like a barometer, really measuring the rise in gold. Silver has not fallen we know, taken by itself, in its purchasing power, but gold has risen, and you get silver, the group of commodities, and the wheat, to be about equally or substantially, roughly, alike.

Fall in silver and labour compared.

18,948. (*Mr. Giffen.*) But silver has fallen measured by labour, has it not?—Yes, if you apply the measure of labour you get quite different results.

18,949. (*Mr. Chaplin.*) You have divided your consideration of the question of prices into five separate areas, I see?—Yes.

Eras of fluctuation in prices.

18,950. You point to the first two as showing a considerable rise in prices?—That is so.

18,951. In the first era I think you contend that prices rose something like four-fold?—Yes, quite four-fold. That is the result, I maintain, of the bringing of the precious metals from America, first from the plunder of the different countries that possess them, and afterwards from the great products of the silver mines of Potosi.

18,952. In the second era you also point to a great rise of prices, and that you attribute, I think, mainly to a plentiful issue of paper money?—Yes, of inconvertible paper money, from 1797 to 1819.

18,953. Have you anything you would wish to put before us as an illustration of the effect upon prices of the issue of paper money?—Prices rose considerably during that period, and taking the whole period together, a period of 22 years, the average annual value of a quarter of wheat, a quarter of barley, and a quarter of oats, added together, was 158*s.* 6*d.*: that was the value of a quarter of each of the three commodities added together on the average of those 22 years.

18,954. Have you made any comparison between the prices at that time and the prices of the present day?—The next era to that, the third era, is after the return to cash payments, when prices were measured by the gold standard, and alongside of the gold standard we had corn laws and very heavy Protection of commodities; yet that period, as compared with the paper-money period, was marked by a great fall in prices, and taking the quarter of wheat, the quarter of barley, and the quarter of oats in that period, they averaged throughout 112*s.* as compared with 158*s.* in the previous era.

18,955. So that during the period of the gold standard, and the corn laws, the prices were considerably less, according to the illustration you have given us, than they were during the era of plentiful paper money?—Yes, the change of the standard had a far more powerful effect than Protection at the ports.

18,956. Although Protection might have been expected to increase the prices of agricultural produce, there was, on the other hand, a fall in these prices, due, in your opinion, I understand, to the adoption of a gold standard?—Yes, and a very heavy fall there was.

18,957. It more than counteracted whatever advantage was to have been derived from Protection?—Yes, much more.

18,958. Then we come to the fourth era. That era, I see, includes the period during which the great gold discoveries were made, and free trade was adopted as the policy of the country?—Yes. Those two things, singularly enough, were nearly contemporary. The abolition of the corn laws was one year before the beginning of the great gold discoveries, and that period was distinguished by a general rise of all prices. As regards agricultural produce, it maintained the value of the quarter of wheat, the quarter of barley, and the quarter of oats added together, at almost exactly the same level as we had it under the corn laws, and the gold standard, before the great gold discoveries.

18,959. The protective duties in the previous era having been extremely heavy?—Yes. The sweeping away of them really left us with substantially the same prices during the first 32 years of free trade. As regards meat, of which I have not the comparative figures, the price of that rose substantially in the free trade and great gold discovery period.

Mr. R. I. Everett, M.P.
3 May 1894.

18,960. And at the end of that period, which closed, I think, in your view in 1878, after having had free trade for a great number of years, agriculture was able to look back upon a period of almost unbroken prosperity; is that so?—Yes, that is so. There is hardly anything like it in our agricultural history.

18,961. That period of great prosperity you attribute, I understand, to the influence upon prices of agricultural produce, brought about by the great discovery of gold?—Yes, and also to the general rise in the prices of all other products, so that the whole industry of the country was in a thoroughly active condition.

18,962. Then we come to the 5th era into which you have divided the long period over which you have given us your very interesting history of agriculture, and that era is distinguished by the monetary legislation which has operated so injuriously in your opinion against silver?—Yes.

18,963. What have been the prices during that era taking the articles you have already given us as an illustration, as compared with the period immediately previous?—They have been falling through nearly the whole of that period. I have not there added all the years together, I have simply taken the prices of 1892, and the articles which in the paper money era were worth 158*s.*, in the gold standard and Corn Law period 112*s.*, and the gold discoveries and free trade era 111*s.*, in 1892 had come down to 76*s.*; and this year they are lower than that.

18,964. You are anxious, if I understand you, to call the attention of the Commission as emphatically as you can to this fact; that whereas after the gold discoveries there was a period of unbroken and unprecedented prosperity for agriculture for a great number of years, since the monetary legislation upon which you have laid so much stress, there has been a period of an exactly opposite description, of constantly falling prices and of very great depression in agriculture?—That is so; a period of intense and increasing depression and suffering.

18,965. (*Mr. Lambert.*) Was the third era that you mention a period of agricultural depression?—Yes. During that period we had three different Committees of the House of Commons and one of the House of Lords, inquiring into the reason of the depression in agriculture.

18,966. The fourth, of course, was a period of prosperity?—Yes.

18,967. But there is only a difference of about 1*s.* or 1*s.* 4*d.* a quarter upon the aggregate value of a quarter of oats, of barley, and of wheat?—Yes. The intense agricultural suffering in the third era was in the first three quarters of the period; when you got towards the end of the era the general arrangements between landlords and tenants and labourers had accommodated themselves to the lower range of prices, so that in those years men got some relief.

18,968. Presuming that the prices that gave prosperity in the 4th era had been current in the third era, would that have meant depression or prosperity?—If no higher prices than those of the fourth era had been in the third era, no doubt there would have been great agricultural suffering, because you come down you see from 158*s.* to 111*s.*

18,969. How was it that we had agricultural prosperity with prices at 111*s.*, whereas there was great depression with prices at 112*s.*?—While the prices were at 112*s.* the depression was only in the earlier years while things were accommodating themselves to the lower level. When the fourth era began they had accommodated themselves to the lower level, and then you went on for a quarter of a century and rather more at steady prices; and if I had got the figures of the prices of wool and meat here, you would see they were on the whole, rising prices.

18,970. (*Mr. Chaplin.*) You attribute the marked distinction between the fourth period of which I was speaking last and the fifth period to this fact, that during the first period agriculture was in a time of steadily rising prices, and during the last period it has passed through a time of steadily and continuously falling prices?—I am persuaded that is the key to the difference in the condition of the industry.

Mr. R. L. Everett, M.P.

3 May 1894.

Opinion of authorities as to effect of monetary changes in prices.

18,971. And that distinction between the two periods you attribute to currency causes?—Yes; to currency changes caused by legislation in the last case.

18,972. Have you any authorities that you can quote in support of the views that you have submitted upon these points to the Commission this afternoon?—I should like very much if the Commission would bear with me a minute or two to read two extracts from Mr. Disraeli, which really, in the light of present events, are very remarkable. On November the 19th in 1873, Mr. Disraeli was in Glasgow; he gave an inaugural address to the students there, and afterwards he spoke to the citizens at the City Hall. I may say that the bank rate at that time was 9 per cent. He said amongst other things this: "I do not believe that the disorders "which have arisen there (in the United States) could "have occasioned or were adequate to occasion the "disorders which have arisen in our own country with "reference to the value of money. I attribute them "to quite another cause, and if I touch on that cause, "which I shall briefly, I do it because I think the "cause is not exhausted and is deserving of the

Mr. Disraeli in 1873.

"gravest attention of men who are so deeply in-"terested in the prosperity of the country and the "action of commerce as those I have the pleasure of "meeting to-day. I attribute the great monetary "disturbance that has occurred, and is now to a "certain extent, acting very injuriously to trade. I "attribute it to the great changes which our Govern-"ments in Europe are making with reference to "their standard of value. I attribute the present "state of affairs very much to a Commission that was "sitting in Paris at the time of the Great Exhibition. "That was a Commission, the object of which was to "establish a uniform coinage throughout the world, a "very beautiful idea of cosmopolitan philanthropy, and "probably if it could be fulfilled could do no great "harm, but I think it would be very difficult to attain. "The Commission of Paris never came to a definite "recommendation on this subject, but they did on "another subject, and that was that no time should "be lost by the States of Europe in taking steps "to establish a uniform gold standard of value. This, "I know myself, arose from an opinion extremely pre-"valent among the Government statesmen of Europe, "and among distinguished economists and merchants "abroad, that the commercial prosperity and prepon-"derance of England were to be attributed to her "gold standard. Now our gold standard is, I think, "a most invaluable arrangement. I think that any "country which has a gold standard of value should, "to use a celebrated expression, think once, twice, "and thrice, before it gives it up. But it is the "greatest delusion in the world to attribute the com-"mercial preponderance and prosperity of England to "our having a gold standard. Our gold standard is "not the cause of our commercial prosperity, but the "consequence of our commercial prosperity, and it is "very well for us to have it, but you cannot establish "a gold standard by violent means. It must arise "gradually from the large transactions of the country, "and the consequent command it may have of the "precious metals. When the various states of Europe "suddenly determined to have a gold standard, and "took steps to carry it into effect, it was quite evident "that we must prepare ourselves for great convulsions "in the money market, not occasioned by speculation "or any old cause, which has been alleged, but to a "new cause with which we are not yet sufficiently "acquainted, and the consequences of which are very "embarrassing; and that is the cause I have taken "the liberty of calling your attention to. Take the "case of Germany. At this moment it is most re-"markable when there has been such a want of a gold "standard in various parts of Europe and in England "where the strain has been so great, Germany has at "this moment 50 millions sterling of gold coin virtually "locked up; and it is locked up because it is the "object of Germany to substitute a gold coinage for "a silver coinage. While it has 50 millions of gold "locked up, it has 80 millions of silver circulating, "and they know very well that if they were to attempt "to substitute violently the gold for the silver coinage "—50 millions of gold against 90 millions of silver—"the consequence would be that the silver already "reduced in value would become reduced still more, "and the 50 millions of gold would all leave Germany. "The consequence is that Germany is taking violent "steps to get rid of this silver. The other day "Germany sent a large amount of silver to Calcutta, "and Germany could only have an artificial means of "forwarding it, and the result was for a long time "you could not buy a single bill on England. These "are all circumstances calculated to disturb the "course of commerce and manufacturing arrange-"ments. Then again, take the case of France and "America, which are floating an inconvertible paper; "but France has also at this moment 90 millions "sterling of French pieces. What must be the "position of France with all that silver already "depreciated when Germany is acting on France, as "she can by getting rid of her silver coinage? By "that throwing it into France, France would be put "into a position of great embarrassment, and would "make violent efforts to establish, as soon as she can, "a gold coinage at any cost. Great disturbance and "immense fluctuations must arise from circumstances "of this kind. I regret to treat matters of this kind "at a moment like this, because they require to be "treated with more precision of language, and with "greater patience than either you or I can afford at "this moment, but it did appear to me a subject to "which I ought to call your attention. You are com-"mercial men interested in the monetary system of "the world; you ought to have your eye carefully "upon the efforts which are making to establish a "gold standard of value in Germany, in France, and "soon you will find also in America. Legally, of "course, there is a gold standard in America, but "virtually, there is not, in consequence of its present "state of depression. Holland and all the Scandi-"navian States are also bent on establishing a gold "standard, and when countries inundated with silver "are bent on getting rid of it, convulsions must "come, and no one would be able to form an adequate "idea of the monetary arrangements of the times in "which he lives, if he omits from his consideration "the important subject to which I have called your "attention." That was in 1873.

Mr. R. L. Everett, M.P.

3 May 1894.

18,973. (*Mr. Giffen.*) Mr. Disraeli had been a diligent reader of the "Economist" at that time, I believe?—And you had been instructing him, then, I presume? Then there is another much shorter extract from a speech that Mr. Disraeli (now become Lord Beaconsfield) made in the House of Lords on March 28, 1879, in the discussion on the depressed condition of agriculture and trade. He said: "After the repeal of the "Corn Laws there was considerable suffering among "all classes, not merely in the agricultural classes, but "in trade generally there was great discontent and "dissatisfaction. . . . . Suddenly after three or four "years there was an extraordinary revival in trade and "a great elevation in prices. How did that occur? One "of the most wonderful events in the history of the "world happened, and that was the discovery of gold in "California. In 1852 36,000,000*l.* of gold were poured "into Europe, and when your Lordships remember "that the business of the world had been carried on "until that time by an amount of gold which I believe "never reached 6,000,000*l.* a year, you can at once "apprehend the effect of this discovery. In one year "there came 36,000,000*l.* of gold, and in five years "150,000,000*l.* were poured into Europe. The effect "of this was that prices were raised immensely. "But a marvellous thing occurred also shortly after. "There was a commission of all the great States of "Europe, who took advantage of the holding of the "exhibition at Paris to meet there with the consent of "their Governments, to consider whether a uniform "system of coinage could not be established, and that "advantage ought to be taken of the gold discoveries "to bring about this result. . . . . The Govern-"ment of Germany, which had 80,000,000*l.* of silver, "availed themselves of the great change of which I "am speaking to substitute gold for their silver. "All this time the produce of the gold "mines in Australia and Calliornia has been regularly "diminishing, and the consequence is that while these "large alterations in favour of a gold currency have "been taking place in the leading nations of Europe—"notwithstanding an increase of population, which "alone always requires a considerable increase of gold "currency to carry on its transactions—the amount "every year has diminished, and is diminishing, until "a state of affairs has been brought about by the gold "discoveries exactly the reverse of that which they "produced at first. Gold is every day appreciating "in value, and as it appreciates in value the lower "become prices. This, then, I think, is the third "cause (of the depression)—not dogmatically stated, "but only with that diffidence which becomes one who "has to speak on an abstruse and complicated subject

Mr. R. L. Everett, M.P.

3 May 1894.

" —which, I think, earnestly requires the considera-
" tion of your Lordships, and which may lead to
" consequences which may be of a very serious
" character. . . . . It is not impossible that as
" affairs develop the country may require that some
" formal investigation should be made of the causes
" which are affecting the prices of the precious metals,
" and the effect which the change in the value of the
" precious metals has upon the industry of the country
" and upon the continual fall of prices."

18,974. (*Mr. Chaplin.*) What was the date of that speech?—It was in 1879 that Lord Beaconsfield made that speech.

18,975. That speech practically amounted to a prophecy which was fulfilled by the appointment of the Commission on Gold and Silver nearly 10 years afterwards?—Yes, it is a very remarkable instance of political sagacity.

18,976. (*Mr. Giffen.*) But the Agricultural Commission of 1879 and 1880 did not investigate that subject of the fall of prices very much, and I believe I was the only witness who gave evidence upon that subject before it?—Yes; I think the extraordinary prosperity which followed the gold discoveries drove all knowledge of currency matters and their importance as bearing on active or slack industry quite out of the minds of the generation that grew up at that time. Then Mr. Goschen made a speech in the House of Commons in 1883, in which he attributed a portion of the agricultural depression to the appreciation in the value of gold.

Mr. Goschen in 1883.

18,977. Are you referring to Mr. Goschen's speech at the Bankers' Institute?—No, this was earlier than that—this was on the 20th February 1883.

18,978. (*Mr. Chaplin.*) There was a speech, I think, made by Mr. Goschen in the House of Commons; he was the first to call attention to this question as one of the probable causes of agricultural depression, was he not?—Yes, that was in this speech which I have here which was delivered in February 1883. Then I have a short extract from a speech which the Paris Baron Rothschild of that time gave utterance to in 1870. He said: "The simultaneous employment of the two
" precious metals is satisfactory, and gives rise to no
" complaint. Whether gold or silver dominates for
" the time being it is always true that the two metals
" concur together in forming the monetary circulation
" of the world, and it is the general mass of the two
" metals combined, which serves as the measure of the
" value of things. The suppression of silver would
" amount to a veritable destruction of values without
" any compensation." I think those words have been remarkably fulfilled in the experience of the last few years.

18,979. Which Baron Rothschild was that?—That statement was in 1870 in Paris—it was the Paris Baron Rothschild.

18,980–1. That must have been the father of the head of the present house in Paris?—I think so. He discerned what was likely to follow as regards the falling away of values, and the destruction of property by trying to make one metal do the work of two.

18,982. (*Mr. Giffen.*) On what occasion did he make that remark?—That was something to do with bankers, I think, it was at a conference in relation to bankers.

18,983. Was there not a monetary Commission in Paris about that time?—That was the date of the Franco-Prussian War, was it not?

18,984. A little before that, I think?—I do not know what month in 1870 it was.

18,985. (*Mr. Chaplin.*) Where did you obtain the extract from?—I cut this out of a book on money, but I do not now remember what book.

Committee and Conferences on monetary questions, 1876-1881.

18,986. You are clearly of opinion that there has been something extremely wrong with regard to money since the year 1873?—Yes. I think the history of what has happened publicly since then is a remarkable testimony to that fact. Speaking of England we had a Committee of the House of Commons appointed in 1876 with Mr. Goschen as its Chairman, to inquire into the cause of the depreciation of silver measured by gold; then we had a monetary Conference of the Nations at Paris in 1878; then we had the Royal Commission on Agricultural Depression in 1879 and 1880; then we had another monetary Conference at Paris in 1881; then the Royal Commission on depression of trade and industry in 1886; and that Commission paused in their work and issued a special report calling attention to the fact of the evidence of a good many witnesses who had testified before them that the depression was largely connected with the change in the value of gold and silver; and that Commission in that special report strongly urged the Government to make changes in gold and silver the subject of a special separate inquiry.

Royal Commission on Depression of Trade and Industry, 1886.

18,987. I think it is the fact, is it not, you will be able perhaps to speak from memory and correct me if I am wrong, that the majority report of that Commission which was presided over by Sir Stafford Northcote attributed the main causes of depression to the fall in prices due to the appreciation of gold?—Yes, that was so, I believe.

18,988. I think the expression was, "We give this a
" leading place in our opinion as to the causes of the
" depression," have you got an extract from their report?—I have got a short extract here from that special report which they issued, "Among the subjects
" to which our attention has been called in the course
" of our inquiry is one which seems to us to require
" special consideration both on account of its actual
" importance, and because of the anxiety expressed in
" regard to it in many mercantile quarters as having a
" direct and a peculiar bearing upon the trade and
" industry of the country and upon the prices of com-
" modities. We refer to the important subject of the
" currency so far as it is concerned with changes in
" the value of the precious metals." Then they conclude by humbly submitting that "the necessity for a
" separate and special inquiry is urgent."

Gold and Silver Commission, 1886

18,989. After the Commission on the depression of trade and industry had sat in 1886, is there anything else that you have to suggest?—They recommended the appointment of the Gold and Silver Commission, which was appointed in 1886. That Commission I may say agreed that the fall in prices was largely connected with the change in monetary conditions and recommended an increased use of silver among the nations.

18,990. That Committee, if I remember aright, issued three reports?—Yes.

18,991. The first report was signed by all the members of the Commission?—Yes.

18,992. The second report was signed by six members, was it not?—Yes.

18,993. And the third report was signed by six?—By six also.

18,994. The second and third reports differed in this respect I believe, that one of those reports recommended the adoption of bimetallism, and the other declined to recommend it, thinking, at all events, the time had not arrived for such a policy; that is so, is it not?—That is so; and one of the six has since changed his opinion, and concurs in the views of the other six—that it is desirable to return to a double legal tender.

18,995. (*Mr. Lambert.*) Who is that?—Mr. Leonard Courtney.

18,996. (*Mr. Chaplin.*) So it may be said, then, that a majority of the Gold and Silver Commission were in favour of adopting the policy of bimetallism?—Are now in favour at any rate.

18,997. The whole Commission, I understand, were unanimous as to the feasibility of maintaining a settled ratio between gold and silver by the action of governments?—It is very clearly testified by them that in any circumstances possible for them to forecast a combination of the leading nations—and they enumerate, I think, about six of them—would in their opinion hold the two metals at a steady ratio.

18,998. But it is also the case, I think, that although the whole 12 Commissioners signed their names to paragraphs in the report having that effect, two of them subsequently signed a memorandum of their own in which they express some doubts as to how far that ratio could be permanently maintained?—Yes.

18,999. Although they were of opinion that it could be maintained for a long period of time?—Yes, that is correct.

19,000. As far as you know I have correctly described to you the effects of the reports of that Commission on those points?—Yes; they also pointed out that the relative value of silver and gold had remained substantially steady for 200 years prior to 1873, and that the legislative changes then made commenced a new era of very violent alterations of value between the two, quite unprecedented in the history of the past, and that they could hardly but think that the two things stood in relation of cause and effect.

Mr. R. L. Everett, M.P.

3 May 1894.

19,001. This Commission pointed out that, at all events for 70 years, the ratio between the two metals had remained practically steady?—They did.

19,002. That was in spite of the fact that there had been immense variations during that period in the relative production of the two metals?—Yes, it covered the most extraordinary variation that the world has ever seen—the great gold discoveries.

19,003. At one time during that period I think I am right in saying there was three times as much silver produced as gold, and at another time during that period three or four times as much gold as silver, is that not so?—They say in their report that the production of gold annually increased from an average of two millions for the first 14 years of the century to an average of 27 millions during the 20 years from 1850 to 1870, and they say that the action of the Latin Union in 1873 broke the link between gold and silver, which had kept the former as measured by the latter constant at about the legal ratio, and that when this link was broken the silver market was open to the influence of all the factors which go to affect the price of a commodity.

19,004. Then, although this great practical stability had been maintained during all those 70 years up to 1873 in spite of immense variations in the relative productions of the metals after 1873, a very wide divergence very shortly occurred between the relative value of the metals?—Yes, it did; the variations in one year several times exceeding the variations over the whole of the previous 70 years sometimes. The variations have been even more violent since that report was published.

19,005. The ratio, which had remained practically steady at 15½ to 1 up till 1873, has now fallen to what ratio—are you able to say what the ratio of to-day is?—I do not think I know exactly how it is; from 1 to 15½ it has gone to 1 to 33, I think. An ounce of gold will exchange for twice as much silver as formerly.

19,006. This great and striking change in the ratio has occurred, although during the period since 1873 there has been nothing like an equal variation in the relative amount of the metals which have been produced compared with the variations for many years prior to 1873?—That is strictly true. In the latter period there has been a considerable excess of silver over gold, but nothing like the extent to which the excess of gold over silver reached in the period within which the two metals continued in their steady relation one to the other

19,007. Then after the Gold and Silver Commission in 1886 have you anything else that you wish to refer to as evidence of something being wrong with regard to money?—Another monetary conference was convened and sat in 1892.

Brussels Monetary Conference, 1892

19,008. (*Mr. Giffen.*) Was there not a conference in Paris in 1889, the year of the Exhibition?—I have lost record of that if there was.

19,009. Was there not a conference in that year to which Mr. Foxwell and Mr. Grenfell went over from this country, and at which a good many French economists expressed opinions adverse to bimetallism?—That has not come under my notice.

19,010. (*Mr. Chaplin.*) The conference you refer to as having occurred in 1892 I presume was the Monetary Conference at Brussels?—The Brussels Conference; then following on from that we have the Royal Commission on which we have the honour to sit, still enquiring into agricultural depression, and having testified to it that money considerations are at any rate connected considerably with the existing depression; and then we have the fact that an Indian Currency Commission was appointed last year.

19,011. I understand that you point to the appointment of all these different Commissions and Conferences as evidence strongly supporting your views that there must be something very unsatisfactory and very wrong in the position of money since the legislation which occurred in 1873?—Yes; I think they are all conclusive evidences that that is so—there had been nothing of the kind in the previous period.

Effects of appreciation of gold on agricultural prices and rents.

19,012. Have you anything to tell the Commission with regard to your views as to what have been the practical effects of this rise in the value of gold more particularly connected with agriculture?—It appears to me that you see them everywhere in the history of the period. We had the great movement against tithe in Wales, which arose from the farmers finding themselves in circumstances in which it was more difficult to pay tithe than they had found it before—which a fall in prices would quite well account for, especially as the fall in tithe lags seven years behind the fall of prices in the current year. Then there was the dreadful trouble in Ireland which led to the passing of the Act of 1881 by which courts were appointed to fix rents. Those rents were fixed at amounts which were cried out about very much at the time as being too low, but not many years had elapsed before they again became so high as to be impossible, and our Parliament did a thing unprecedented I should think in its history, and broke the agreements which they themselves had sanctioned for 15 years, and eased the burdens upon the shoulders of the tenants.

Mr. R. L. Everett, M.P.

3 May 1894.

19,013. In connexion with this subject, are you familiar with the writings of a prominent Irishman well acquainted with the Irish land question on this subject, namely, Archbishop Walsh?—Yes, and I have read with much interest his book upon this subject.

Effect of appreciation of gold on debts and mortgages.

19,014. Have you any other point that you would like to refer to as an evidence of the practical effects of the rise in gold?—The Anti-Semitic movement in Europe which has been so pronounced is really the groaning and struggle of the indebted classes against the greatly increased weight of the burden which they owe to the money-lenders. The number of the units of money that they owe has not increased, but owing to the fall in prices it takes a larger quantity of produce to bring those writs to meet the money-lender's charges. That appears to me to be just such an effect as you would expect to accompany a great rise in the value of money. Then the Government of India owes a large sum in gold to this country, and it is entirely in connexion with the increased weight of the burden of that debt that our financial troubles in India have arisen. India internally has been prospering.

19,015. (*Mr. Giffen.*) How much does India owe?—Between 18 and 19 millions a year.

19,016. Not of debt?—Of gold obligations which have to be paid.

19,017. But not debt?—Railways, and so on.

19,018. (*Mr. Chaplin.*) Part of it is debt and part of it is in virtue of home charges which have to be annually met, is that not the case?—Yes. I have heard it stated again and again in the debates we have had upon this matter that India has to pay between 18 and 19 millions each year in gold.

19,019. You are not prepared at this moment to say how much of it is actually debt?—No; how does that bear upon the matter?

19,020. It amounts to this, that they are under liability to make payments in gold to England amounting to something like 17 or 18 millions a year?—Yes, quite as much as that; and that is paid by produce, and as it takes nearly double the quantity of produce to raise the same quantity of gold that it did, their burden, though not increased in the number of pounds that they owe, is increased in real weight by that extent.

19,021. Then you point also, I think, to the great depreciation of landed property in this country?—What I was saying of India applies also to Australia. They owe, I think, about 14 millions, and the real burden of that is increased in the same proportion. There have been great troubles there, and there has been great depreciation of their property. There has been a very great depreciation of all agricultural property, and in fact of nearly all industrial property both in England and our Colonies and in all gold standard countries.

19,022. I suppose the position of people whose estates are mortgaged is seriously affected from the same cause?—It has been something perfectly awful; land, that property which was supposed to be the most secure in the whole world, and on which people were positively eager to advance you money, now keeps wasting away in value, so that where your mortgage was an amount which you could very easily deal with 15 years ago, it has now become quite impossible to meet the interest. Thousands of perfectly innocent and deserving people have been driven into hopeless ruin, and lots of them have cut their throats and made away with themselves as the easiest way of getting out of the difficulty.

19,023. Have you anything further to say with regard to the position of farmers and landowners generally as affected by this state of things?—The continual fall in prices is hurrying them one after the

other from difficulty to difficulty and finally landing them in ruin.

19,024. Have you anything further that you wish to say to the Commission?—That we were able to reduce the interest on the National Debt also is a confirmatory fact. The value of gold has risen so much that industry is not able to pay the quantity of gold for the use of money that it used to do. Industries have become unprofitable, and money instead of being eagerly sought by the industrial classes to employ in production has become quite a drug, and in consequence of that the first-class securities have risen in value owing to the increased demand for them, and fallen in their rate of interest. It is part of the same question; what affects our agricultural industry affects with very nearly equal severity so far as I can learn the great cotton industry, and the woollen industry, and the iron industry, and most of the great industries of the country.

Present depression compared with former periods.

19,025. (*Chairman.*) I presume that you consider the depression of the last few years, and the consequent inquiries by Commissions and Committees are not dissimilar to the condition of things in your third era, namely, 1821 to 1836?—They are practically identical in my view.

19,026. Then I think you stated that between 1837 and 1846 agriculture revived in consequence of the adjustment which took place with regard to the new condition of things?—Yes, I believe that was so.

19,027. There was a general revival during that period?—Yes.

19,028. And at the end of it agriculture had achieved a prosperous condition again?—Yes.

19,029. Is it not possible that the same thing may occur now, and that when prices have reached their lowest, and when things have adjusted themselves to the new condition of things we may again have a revival of prosperity in agriculture without a rise of prices?—I think if the level of prices which we have reached now is maintained with comparative steadiness for 10 or 15 years we shall probably see agriculture in a fair condition of prosperity, but there would have been the unspeakable miseries of the sufferings and ruin of a generation involved.

Possibilities of adjustment of affairs to present prices.

19,030. Supposing at this moment that prices are maintained, and that there is no further fall, judging from the evidence that you have given as to what occurred between 1837 and 1846, is it not probable that things will adjust themselves to this new condition, and we may expect a revival of prosperity if there is no further fall?—Yes, but I think we should see this change now different from what occurred then, labour has become much stronger, and we shall not be able to adjust agricultural wages to the lower level.

19,031. I thought you said that in your county wages have already fallen from 13*s.* a week to 10*s.*?—Yes.

19,032. That is a fall of 23 per cent.?—Yes, and the fall in the value of our produce has been nearly 50 per cent.

Effect of low prices in cultivation.

19,033. No, I cannot admit that it has been 50 per cent. upon your own showing. However, I will come to that——?—My view of what will happen if this present level of prices is maintained is this, that quite half the present land that is tilled will go down to permanent pasture. I do not think anything else can come.

19,034. When prices have adjusted themselves do you think it is possible that then there may occur what occurred between 1837 and 1846; land did not then go out of permanent cultivation, but it remained in cultivation; there was a readjustment, and according to your own account there was a period of prosperity?—Yes.

19,035. Why should not that occur again on the assumption that prices remain as they are?—I do not think that you can get wages down low enough to enable you to continue to cultivate the land with the plough. No doubt in permanent pasture the earth will yield a produce, but human labour will have to be dispensed with largely.

Fall in purchasing power of gold.

19,036. I think you said that the purchasing power of gold had fallen from 100 to 66?—Yes.

19,037. Does that not show that the purchasing power of gold has appreciated by 34 per cent.?—You can buy 50 per cent. more commodities to-day with an ounce of gold than you could some 20 or 30 years ago.

19,038. No, I cannot see it in that way; taking the assumption that the purchasing power of gold which was 100 a few years ago and is now 66, does that not show a net appreciation of 34 per cent.?—Taking it that way it does seem to show so, but I do not think that is the fair way of estimating the change.

Mr. R. L. Everett, M.P.

3 May 1894.

19,039. Does that not also involve that prices of commodities have depreciated 34 per cent.?—Yes, that is so with commodities.

Fall in rent and rates in Suffolk.

19,040. Now, taking the adjustment that has already taken place with regard to the new conditions—take the county of Suffolk—has not the rent depreciated by 50 per cent.?—Yes, I think it has.

19,041. Generally speaking, have the farmers had the benefit of the reduction of their rents in the reduction of their assessments?—Not to the full extent, but they have had a benefit in that direction.

19,042. Are you certain that they have not had the full benefit?—Yes, I am sure that is so. It has been the most difficult thing in the world to sit on an assessment committee and to deal with questions of assessments lately. When there is a farm in the district which is really in the market and hangs fire, it is often let at almost nothing; then the assessment committee feel that it will not do to assess that farm at practically nothing or they must do the same all round.

19,043. That of course is a very extreme case; but we will suppose the case of a sitting tenant whose rent is reduced 30 or 40 per cent., does not he get the benefit of that reduction in his reduced assessments?—I think it follows after with considerable slowness.

19,044. Within two or three years afterwards?—It will gradually adjust down to that.

19,045. Does it not gradually take place, and after two or three years does he not get the full benefit of that reduction?—I should think it would take quite five or ten years before he would get the full benefit.

19,046. Have you made a comparison of the actual assessments in particular unions with a view of ascertaining that?—No, I have not; there are hardly two unions which pursue the same course; some make percentage reductions all round and some go through the assessments afresh.

19,047. Still in many cases I think you will admit that although some years may have elapsed yet the tenants have derived the benefit of the reductions of their rent and of the reductions of their assessments?—They are following after.

19,048. Where that is the case the rates have adjusted themselves to the new conditions?—Yes.

Fall in tithe.

19,049. Then the tithe has adjusted itself to the new conditions?—Yes, but that again, as you are aware the adjustment there takes seven years to effect.

19,050. You have already pointed out that that lags behind?—Yes.

19,051. I presume we may take it now at the present moment that tithe has already adjusted itself to the new conditions?—Partially, but I think it will go 5 or 10 per cent. lower than it is.

19,052. Still with that exception it has adjusted itself?—Yes, and the tithe is now nearly universally paid by the landowner in our county.

Fall in labour.

19,053. Then in your own county you stated that the wages had been reduced from 13*s.* a week to 10*s.* or 11*s.*?—Yes.

19,054. Does that not show an adjustment to the extent of 23 or 24 per cent.?—Yes, but from all I can hear I do not think a great deal of the land will continue to be kept in cultivation even at that rate.

19,055. That is another point; I am now asking you as to the actual facts, whether on your assumption the wages have not adjusted themselves to the extent of 23 per cent.?—Yes, speaking broadly.

19,056. I presume that if the prices of commodities all round have been reduced by 34 per cent., the labourer with wages at 10*s.* is nearly as well off as when his wages were 13*s.*?—I think generally speaking the labourers are better off than they were except that there are fewer of them employed and their employment is not quite so certain.

19,057. Then you admit that an adjustment has taken place in respect of wages?—Yes, or is taking place.

19,058. (*Mr. Lambert.*) Not in the purchasing power of the money wages?—I think the purchasing power of the money wages of to-day is probably greater than that of the wages of 20 years ago.

Mr. R. L. Everett, M.P.

3 May 1894.

Fall in prices of manures, and feeding stuffs.

Farmers prospects under present conditions.

19,059. (*Chairman.*) Then I presume that the farmer in his purchases of manures, feeding stuffs, and so forth, gets the benefit of a large reduction there?—Yes, he does; those adjustments follow comparatively quickly.

19,060. And he has got the full benefit therefore in those purchases of the fall in prices?—Yes, that is so.

19,061. Then, taking the position all round, do you not think it is possible that in your district prices may be now on the point of adjusting themselves so that the farmer can get on as well as he did before, having regard to the reduction of rent, of rates, of tithe, of wages, and of the price of the articles that he wants?—I should say without hesitation that your farmer of to-day, with his farm hired at recent rents and with all the adjustments which have taken place is not doing nearly so well as he was 20 years ago with all the higher charges.

19,062. But that was a period of great prosperity?—Yes.

19,063. I am now comparing it with an average period; do you not think that with these adjustments it is possible that he may make a fair average living?—It no doubt will have to adjust itself to that, but I am sorry to say that we have not grappled with the frightful effects of last year's dreadful season yet.

19,064. That is another point I was going to mention; last year and the year before, they were exceptionally bad years, were they not?—Only last year with us.

19,065. Putting last year aside as a very exceptional one, do you not think that with average seasons and with the fall of prices and various changes in the directions I have referred to, the tenant farmer may be expected to do fairly well?—Yes, I think so, after a bit; but it will be part of it on condition that there will be much more permanent pasture, that a larger portion of the farm will be in permanent pasture.

19,066. Has that not got a reference to another matter, namely, the exceptional fall in the price of wheat? I am now referring generally to the prices of agricultural produce?—Yes, I think it has and to the fact that labourdoes not respond so fast as prices.

19,067. You stated that in your own case you lost a portion of your capital?—Yes.

19,068. Do you mean by that that the value of your stock is reduced?—Yes.

19,069. That, in fact, means that the estimate of the actual capital value of your stock is reduced?—Yes

19,070. But the stock is in the same proportion?—Yes. Where one wanted 12*l.* per acre to keep a farm well stocked, now the same stock probably would be only worth about 7*l.* an acre.

19,071. Then a farmer coming in afresh to a new farm and having to stock his farm would be under a great advantage?—It would require less capital to take it.

19,072. In your own case you have got the stock upon the land, although the value is reduced?—Yes, that is so.

19,073. Therefore when you say that you have lost your capital or part of your capital, you do not mean to say that you have got less stock than you formerly had?—No.

19,074. But that the value of that is less?—Yes, I am sorry to say I have had several times to call in money from other sources in order to keep the same head of stock on the farm; the farm has not kept itself.

19,075. I presume that during the last 10 or 12 years you have incurred losses by the adjustment not taking place quickly enough?—Yes.

19,076. And that has been the real difficulty of farmers, that the adjustments that I have referred to have lagged behind?—Yes.

19,077. And that they have been slower in their operation than the fall in prices?—Yes, that is so.

19,078. You have suffered in that way?—Yes.

19,079. But that does not affect the future, I think?—No, I think we should have to have two or three more years before the adjustments would be complete enough to get agriculture again into a normal condition but then with fresh capital and fresh men it could no doubt go on at this low level of prices as it did at the higher level.

19,080. I think you agree that what occurred between 1837 and 1846 may happen again?—Yes.

19,081. That after the adjustment has taken place we may not unreasonably expect a period of prosperity?—Yes.

19,082. Or a period of average conditions?—Yes; but with the dreadful sacrifice of a generation in the interval.

19,083. (*Mr. Chaplin.*) You mean after the present generation has been sacrificed?—Yes.

19,084. (*Chairman.*) You hardly mean that, do you?—That is if you take the present generation from 15 years back.

19,085. Quite so; the people who have been in possession of farms during the last 15 years have incurred considerable losses?—Yes.

19,086. Starting from this moment from to-day, if prices are maintained as they now are, then with the adjustments that have already taken place, and with some further adjustments, yo i think that it is possible that we may have a revival of a fair condition, an average condition, such as occurred between 1837 and 1846?—Yes; if we have reached a stable level of prices, low as it is, things will adjust themselves and go on again.

Effect of appreciation of gold in prices.

19,087. I presume you would also admit that gold having appreciated, according to your view, 34 per cent., the same amount of gold will now go very much further than it did a few years ago?—Yes; but unfortunately that is not the case with all your outgoings; with your school bills and doctors' bills, for instance.

19,088. I am now talking generally of the currency question; gold having appreciated the same amount of gold will go much further than it did a few years ago?—Yes; that is certainly so.

19,089. You are aware also from what Mr. Giffen has said that the production of gold has considerably increased?—Yes; but I think Mr. Giffen omitted this factor in the estimate he formed, that under the Bland Act and under the Sherman Act we have added practically to the gold standard money in the shape of silver which was full legal tender; under the Bland Act it was about four millions a year additional, and under the Sherman Act it was eight millions a year, which has now ceased to be added. So that the additional new gold will not quite make up for what has stopped coming in through the cessation of the Sherman Act.

19,090. (*Mr. Chaplin.*) In fact, we shall be worse off than ever?—Yes.

19,091. (*Chairman.*) You rather fear that the increased production of gold, which has already come about, will not be sufficient to make the adjustment?—I very much fear so. I fear there will be a further fall in prices.

Displacement of gold by silver in the United States.

19,092. (*Mr. Giffen.*) Is the assumption quite correct, that the silver coined under the Bland Act, and the silver purchased under the Sherman Act, took the place of gold in the United States system to any material extent?—Entirely so; it became just the same as the gold, in my view, because paper certificates were issued against it, which passed into circulation and are in circulation to-day.

19,093. But are you quite sure that the United States would not have practically taken about as little gold as they have done, even if this expedient had not been resorted to?—I think that prices would have gone to a still lower level than they have done if it had not been for the additions made to the stock of standard money under the Bland Act and under the Sherman Act.

19,094. But still that is a matter for argument; it would have been possible for the United States to have carried on their monetary affairs without the silver and without any more gold than they have actually used?—Yes, but they could only have done it by submitting to a still lower level of prices.

19,095. Are you quite sure of that?—Yes, as sure as I am of anything.

Probable course of prices.

19,096. (*Chairman.*) Are we to take it that you are of opinion that the prices may go still lower?—I very much fear so; in fact, I decidedly think they will; I think what we have done in India will work that way.

19,097. But apart from that?—Yes, I do not think that the supplies of new gold are sufficient yet to

Mr. R. L. Everett, M.P.

3 May 1894.

counterbalance the effect of the cessation of the additions through the silver in the United States.

19,098. Then in spite of the great reduction of prices all round you think they may still go down further?—I greatly fear so.

Estimated quantity of gold in the world.

19,099. (*Mr. Chaplin.*) Can you give us any estimate of the amount of the existing mass of gold in the world?—I think there was supposed to be about 800 millions of gold existing in the form of coin and ornaments a few years ago.

19,100. So that an annual addition of six millions to an existing mass of that sort is comparatively immaterial?—At the time the Gold and Silver Commission sat they said that the then existing annual production of gold only added about 1¼ per cent. to the existing mass, and that the addition of silver was only about 1½ per cent.

19,101. (*Chairman.*) The addition of six or seven millions a year to the production of gold is in respect of gold which has already according to your opinion appreciated 50 per cent.?—Yes.

19,102. Therefore it goes very much further than it would have gone a few years ago; is that not so?—Still, I think, large as the addition is, in the last year or two it does not compensate for the supply of legal tender money cut off by the silver legislation.

Demand for farms and reduction of rents in Suffolk.

19,103. In your district where farms are vacant will they let; is there a demand for them?—You can let them at a price, but those landowners who can afford to do so are very largely keeping them in their own hands rather than take, say, 5*s.* or 10*s.* an acre.

19,104. Would that mean at a price which is a reduction of more than 50 per cent.?—Oh, dear, yes—a reduction of 75 per cent. often I should think.

19,105. 75 per cent.?—Yes. The best class of farms still command tenants at a much smaller reduction than the poor farms.

19,106. What is the reduction in the case of the best farms?—In the case of my own there certainly is a reduction of 50 per cent. I should think. 50 per cent. on the best farms has been the descent.

19,107. Have you paid income tax on your own farm of late years?—No, I have appealed. I always refuse to pay it and go with my books, and sometimes I have had to pay a little.

19,108. You have claimed exemption on the ground that your profits are below the amount where the exemption takes place?—When I have had exemption it has been on the ground that I had no income; when I have been able to show an income then I have had to pay on that income, not at the half charge, but at the full charge.

Farmers and the income tax.

19,109. Do you think the farmers generally in your district have not paid income tax?—I think there are more farmers who go on paying Schedule B., without any regard to whether they are losing or winning, than who appeal. It is very unwise of them, but I believe that is the case.

19,110. You are aware that the income-tax is not claimed where the rent is below a certain amount, for instance, where the rent is under 240*l.* even the half-rent would come within the limit of exemption?—Yes, it would not be claimed unless the man had income from some other sources.

19,111. I presume, as a rule, the farmers have not got income from other sources?—A large number of those who are still on their feet have, I think, or else they would have been engulphed.

19,112. Is it not the fact that the reduction of rent has very much increased the number of those who claim exemption under that process?—Oh, dear, yes.

19,113. Therefore the reduction of rent has operated to relieve large numbers of farmers from the payment of income tax?—Yes, to put it in their power to obtain relief, and, in fact, they have remissions of it

Mr. R. L. Everett, M.P.

May 1894.

Reduction of rent.

19,114. (*Sir Nigel Kingscote.*) You say that the rent of land in many parts of Suffolk has gone down 75 or 80 per cent.?—Yes.

19,115. Which sort of land is that?—The poor heavy land has fallen most of all—the land which is expensive to work and uncertain in yield.

19,116. Has much land gone out of cultivation altogether?—No, it has been more abandoning some of the worse fields to rough grass—it has taken that form rather than the whole farm being abandoned.

19,117. Has any of it been planted?—A few of the great landowners are doing a little in that way, that is on the light land chiefly.

19,118. Do you think that would pay?—I should think it would.

19,119. Better than continuing to cultivate it?—Yes, with very light land I should think so.

Cost o labour.

19,120. (*Mr. Little.*) Upon the question of labour I think you said to the Chairman that there has been a considerable decrease in the cost of labour, or was it merely in wages, would you say that the cost of labour has decreased to the same extent as the wages?—Hardly, I should think.

19,121. Has the total sum that you pay in labour in a year diminished as much as the weekly wages have diminished?—I think my own has. I think my highest labour bill in any one year was about 850*l.* on a farm of a little under 400 acres, and that is now cut down to about 740*l.*, I think.

19,122. Do you find that as much work is done for the money as was done 20 years ago?—No, the general impression is that there is not so much done for the money.

19,123. A given piece of work put out to piece work would cost as much now as it would 20 years ago, would it not?—More.

19,124. More?—Yes, we have to give more per acre for mowing, for instance, a good deal more, nearly double.

19,125. Then all that would tend to show that the weekly wages are not an indication of the cost of labour taken alone?—No, for our harvests we give more per acre than we used to do.

19,126. Then it is not fair to say that because wages have gone down from 13*s.* to 11*s.*, labour has decreased in cost to that extent?—No, I do not think it is.

19,127. The hours are shorter?—In some cases.

19,128. And the young people are paid more, I presume, than they were?—Yes, of course; you cannot employ child labour now.

19,129. No, but the cost of youths has increased a great deal at all events?—Yes. I have been very much struck with this difference between the children of the farmer, for instance, and the children of the labourer; if the farmer wants to put his children into any occupation in the towns. The youths among the labourers directly they go to work are paid, and paid proportionately to the men; but if you have got a son you want to put into anything in town instead of his employers paying him wages they want you to pay them a lump sum down, and the boy's earnings for the next two or three years are practically nothing.

19,130. But then an agricultural labourer of 17 gets pretty well men's wages?—Yes, I believe we pay young people on the farm much better than the employers in the towns—the shopkeepers pay their young people.

Adjourned till to-morrow at 12 o'clock.

Thirty-fifth Day.

Friday, 4th May 1894.

PRESENT:

THE RIGHT HON. GEORGE JOHN SHAW-LEFEVRE, M.P., IN THE CHAIR.

Viscount COBHAM.
The Right Hon. HENRY CHAPLIN, M.P.
Sir ROBERT NIGEL FITZHARDINGE KINGSCOTE, K.C.B.
ROBERT GIFFEN, Esq., C.B.
Captain OWEN THOMAS.
FRANCIS ALLSTON CHANNING, Esq., M.P.
JOHN CLAY, Esq.
CORNELIUS NEALE DALTON, Esq., C.B.
ROBERT LACEY EVERETT, Esq., M.P.
GEORGE LAMBERT, Esq., M.P.
CHARLES WHITEHEAD, Esq., F.L.S.

HERBERT LYON, Esq., *Secretary.*
R. T. CRAWFORD, Esq., *Assistant Secretary.*

Mr. ROBERT LACEY EVERETT, M.P. (a Member of the Commission), further examined.

Mr. R. L. Everett, M.P. 4 May 1894.

19,131. (*Chairman.*) I think you wish to make an observation with reference to the statement by Baron Rothschild which you quoted yesterday?—Yes. I should like to point out that the extract which I gave from Baron Rothschild, of Paris, is a quotation from his evidence on behalf of the Bank of France before the *Conseil Supérieur* in 1870. I have before me here his words in French. I think they are extremely important words as giving the judgment of one of the mightiest financiers of the age. They are to this effect: "As an extreme consequence it would then be necessary "to entirely demonetise silver. That would mean the "destruction of a portion of the world's capital. It "would spell ruin. . . . It is not a question of "discussing the advantages which may exist in the "possession of a single standard. In my own private "opinion it is impossible to realise this idea.

19,132. What is the union which you live in?—The Woodbridge Union.

Rates in Woodbridge Union.

19,133. I asked you a few questions yesterday with reference to the rating in your district. I find that the poor rates have gone down since 1868, in the Woodbridge division, from 1*s.* 7*d.* in the pound to 8·2*d.* in the pound?—Yes, I believe that is so.

19,134. You believe that to be accurate?—I have no doubt it is; I know they have gone down.

19,135. That, of course, does not include the precept rates, the other rates; it is only the poor rate. Do you know what is the position as regards the other rates?—Are you referring now to such rates as the school board rate?

19,136. To the county rate and the school board rate, if there be one?—There is no material difference in them.

19,137. I observe in Suffolk as a whole the rates are low. The total rates appear to have gone down since 1868 from 2*s.* 9*d.* to 2*s.* 1*d.*?—Yes; we reckon our rates including "Highway Rates" to average between 2*s.* and 2*s.* 6*d.* in the £.

19,138. That is very much less than they were some years ago?—Yes, I believe it is.

Reduction in number of farmers in Suffolk.

19,139. I do not know whether you have looked at the figures which have been printed for this Commission extracted from the Census returns of 1871, 1881, and 1891. They show that the great reduction in the number of farmers in Suffolk took place between the years 1871 and 1881 and not between the years 1881 and 1891. In 1871 there are reported to have been 4,654 farmers and graziers; in 1881, 4,026; and in 1891, 3,724. There was a reduction therefore of 628 between 1871 and 1881, and of 302 in the next decennial period; can you account for that?—I have no doubt that would be owing to the swallowing up of the small farms in the larger ones—a process which went on steadily all through the prosperous times.

19,140. Then that accounts for the reduction in the number of farmers you think in the earlier period 1871 and 1881?—Yes, that would be the main cause.

19,141. And not the agricultural depression?—No, the agricultural depression had not been felt then.

19,142. During the first eight years of that period according to your evidence the district was enjoying considerable prosperity?—Very considerable prosperity.

19,143. And it was that which led to some extent to the amalgamation of farms?—Yes, the large man could farm the land cheaper, and could pay rather a higher rent for it than the little man.

Reduction in number of agricultural labourers in Suffolk.

19,144. Turning to the number of agricultural labourers I find that in 1871 the labourers, outdoor and indoor, were 39,080, in 1881 they were 35,500, a difference therefore of 3,500, whereas between 1881 and 1891 the reduction was from 35,500 to 34,100, a difference only of 1,400. Do you account for that reduction between 1871 and 1881 in the same way, namely by the amalgamation of farms and by the consequent reduction in the demand for labour?—I think it must have been. Our land was being continually better and better tilled, but it was tilled rather more on a wholesale scale by more use of implements.

19,145. When attention is called to the great reduction in the number of labourers of late years it must be considered that a large part of it if not the larger part of it, was due to the amalgamation of farms and not to the agricultural distress of later years?—I think that is a fair inference; and also to the great attractions of the town employment competing and drawing the men out.

19,146. I observe that during the same time the number of nursery men, seedsmen, florists, and gardeners increased from 2,195 in 1871 to 2,581 in 1881 and 3,949 in 1891, showing a continued increase in employment of that character?—Yes, that would be immediately round the towns I expect.

19,147. But still offering a considerable employment for labour?—Yes.

19,148. Then it is also stated that the agricultural machine proprietors, attendants, &c. increased from 92 in 1871, to 224 in 1881, and 235 in 1891. That would seem to indicate that between 1871 and 1881 probably owing to the same cause, namely the amalgamation of farms there was a great demand for the employment of agricultural machines, and so forth, consequent upon perhaps, or resulting in, the diminished demand for labour?—Yes, I think that is a fair explanation of it.

19,149. (*Mr. Chaplin.*) Do you mean that the diminution of labour is owing to the introduction of machinery?—To the consolidation of farms through the good times which was continually going on in my county.

19,150. When farms are consolidated then the use of machinery is introduced which would not otherwise be the case; I want to know if that is your meaning?—Yes, and labour economised thereby.

19,151. (*Chairman.*) Between 1881 and 1891 the reduction in the number of farmers may have been due to the number of farms that fell into the hands of the

Mr. R. L. Everett, M.P.

4 May 1894.

owners?—Yes, that was going on very extensively in these last 10 years.

19,152. Then curiously enough there again the main increase in the number of farm bailiffs, such as it has been, was in the earlier period between 1871 and 1881. The farm bailiffs in 1871 numbered 746; in 1881, 934, which is nearly 200 increase; and in 1891, 908, therefore there has been a positive reduction in the number farm bailiffs in the last 10 years?—I wonder whether the census returns are all compiled on the same plan?

Increase in number of game-keepers.

19,153. Curiously enough, on the other hand, the number of gamekeepers has increased by 50 per cent. in the 20 years in Suffolk, the number of gamekeepers having increased from 456 in 1871 to 512 in 1881, and 648 in 1891. Can you account for that?—No, I cannot.

19,154. (*Viscount Cobham.*) Have not the shootings become smaller; have not many big estates been let off to several tenants instead of having one?—I do not think they have in our county.

19,155. (*Mr. Chaplin.*) Has there not been a vast quantity of land devoted to game purposes entirely within the last 10 or 15 years which formerly was cultivated?—No I think not. It is found that game does not do well without cultivation. The Maharajah Dhuleep Singh had an estate on the borders of Suffolk which gradually all fell into his hands because he preserved game so heavily and the times were so bad for the farmers. He abandoned the cultivation of a large part of it, and the consequence was that its sporting quality was much reduced. The partridge and the pheasant both love the plough.

19,156. What is cultivated in those cases such as you refer to now is cultivated I think by the owner for the purposes of the game, is it not?—To a certain extent that would be so.

Consolidation of farms.

19,157. (*Chairman.*) Then I take it that in your opinion between 1871 and 1881 there was a considerable consolidation of farms going on?—Yes there was; it was constantly going on.

19,158. Has there been any opposite tendency during the last few years?—I think there has rather, because the men who can take a small farm now are many more than the men who can take a large one.

19,159. May we take it that the experience of the last 10 years has shown that the landowners made a mistake in consolidating their farms so much in the previous period?—No, I cannot think that. They were able to make a better rent, and the land was cultivated on more economical principles.

Large and small farms compared.

19,160. I understand you to say that the small farms have done better in the last few years of depression, in your district, than the large ones?—No, I did not say that, but I said there are more men able now to take a small farm than a large one, because of the great loss of capital among farmers; that is the only reason.

19,161. That is the main reason for the demand for smaller farms?—Yes.

"Protection."

19,162. Now, looking generally at your evidence, may I take it that in your opinion, Protection would be no remedy for the present state of things?—Yes, I quite agree with that. Protection is quite impossible in this country, and even if we had it, in my opinion, it would not better the condition of agriculture.

19,163. That is the conclusion that you draw, in part historically, from what took place in the third period that you have referred to, between 1826 and 1837?—Yes. Between 1815, when the Corn Laws were imposed, and 1846, when they were repealed, on the whole, was the most disastrous period for agriculture in the century, until the last few years; quite contrary to the ordinary belief.

19,164. Do you think that large classes of farmers benefit from the free imports and low prices of produce?—I think that the free imports are beneficial to the agricultural classes, as well as to the others.

19,165. (*Viscount Cobham.*) Do the Suffolk farmers agree with you in that opinion, generally?—I am afraid they would not. There is a general impression that the days of Protection were days of great agricultural prosperity, but it has no historical truth in it. It is simply because they are not acquainted with the facts that that opinion is so prevalent.

His own losses since 1879.

19,166. (*Mr. Giffen.*) The questions I propose to ask you relate to the changes of prices and the monetary question, but I wish to begin by a short question with reference to what you told us about your losses in farming; I think you said that you have rather lost since 1879?—Yes.

Mr. R. L. Everett, M.P.

4 May 1894.

19,167. Now, in reckoning your losses, do you include or allow for the value of the things produced on the farm which you consume in your own household?—Yes, I keep them quite distinct.

19,168. So that you have had nothing out of the farming at all, and you have rather lost money; you have not even made a living out of it?—I have had a house to live in. I have not reckoned that as part of my income.

19,169. But that is all; apart from that, you have had no living out of the farm?—No; the farm has lived upon me instead of me living off the farm.

Dependence of prices on quantity of money.

19,170. That was just the point I wished to bring out; thank you. You began your statement with reference to the monetary question, with some account of the theory of the dependence of prices upon the quantity of money, and I should like to ask you whether you consider that that theory has been very exactly formulated?—It is the great regulator of price over any considerable lapse of years, in my opinion.

19,171. But the theory has not been precisely formulated?—I hardly know what you mean by that. All economists, so far as I know—old and new—connect the two things intimately together.

19,172. I asked the question because I noticed in the very interesting extracts which you quoted from different authorities—and I have observed the same point before—sometimes the economists speak of the quantity of money in circulation and sometimes they speak of the supply of the precious metals on the markets of the world?—I have noticed too in writings a little looseness in the phraseology. "Standard money," "full legal tender," and "current money," are not always discriminated between.

19,173. That is another point that I intended to ask you about, but the point I am on is a little different. It seems to me that there is a distinct difference between speaking of the quantity of money in circulation and the quantity of a particular commodity—gold—exposed for sale in the markets of the world; and that the two ideas are not the same?—I think the quantity of full legal tender money is what the economists consider to rule price.

19,174. Have you got the statement of the Bullion Committee before you now?—This extract that I have here from the Bullion Committee relates to the amount of Bank of England notes relatively in 1798 and in 1809, both periods within the time of inconvertible paper money.

19,175. I think you read a passage with reference to the supply of the precious metals in the markets of the world, which you quoted from the Bullion Committee?—Yes. This is from the report of the Bullion Committee of 1810, page 10:—"A diminution or increase "in the general supply of gold will no doubt have a "material effect on the price of any other articles." Then on page 7 they say, "An increase in the general "supply of the precious metals raises prices all over "the world"; and on page 25 they refer to the enormous increase of notes of the Bank of England between the periods of 1798 and 1809.

19,176. Still, the language which they used is "the "general supply of gold" and "the general supply of "the precious metals all over the world"?—That is so.

19,177. And not the quantity of money in circulation?—That is so.

19,178. Are not these two ideas somewhat different; gold is not used exclusively for monetary purposes?—No, it is not, but still, while you have open mints, whatever gold is available in any other form can, at the pleasure of its owner, be immediately converted into money.

19,179. Still, the idea is that gold is a commodity which is subject to the same influences as any other commodity, and has its price regulated with reference to other commodities in the same way that those commodities are regulated amongst themselves?—Yes, I think that is so.

19,180. And there is substantially no difference?—None, I think.

19,181. But the idea that prices depend upon the quantity of money in circulation is a somewhat different

Mr. R. L. Everett, M.P.
4 May 1894.

idea?—Yes, perhaps it is. Of course the gold and silver in coin have their value where there are open mints by reference to the quantity of metal that the coins contain.

19,182. Then which idea is it that you would rather adhere to of these two different ideas about the dependence of prices upon the quantity of money?—I think when it is a question of the precious metals that the whole quantity of the metal in the possession of mankind in any form is a material element.

19,183. Is it not rather the whole quantity of the metal which is marketable, and which is brought to market?—Yes, that was what I meant—which could be brought to market if it were wished.

19,184. Which is likely to be brought to market?—Yes.

19,185. If you have a quantity of the precious metals existing in a form that makes it unlikely to be brought to market at all, that would hardly enter into the question of the price of the commodity?—It would not have nearly so much effect, I imagine, on the value of the metal as if it were in a current form—a liquid form, so to speak.

19,186. Still, it is rather to that idea that you adhere, and not to the quantity of money in circulation?—I cannot help thinking, with regard to the precious metals, that their existence in the possession of mankind in any form is a material element in their value as against other commodities.

19,187. (*Mr. Chaplin.*) Is this what you mean to convey: that in your opinion they are all potential money, and, if necessary, could be brought to the mints?—Yes, that is exactly it.

19,188. (*Mr. Giffen.*) Still, they are not money in circulation in the sense in which some authorities have used the word, and have had it in their minds?—My idea is this, that the value of a sovereign does not depend upon the fact that it has been through the mint and has been coined. It has the whole of its value from the amount of gold it contains, and if I had that gold in any other shape, not having been through the mint, it would be of just as great value.

19,189. Then you would not say that prices in England depend upon the quantity of gold in circulation in England?—Not wholly I think. I think the prices would depend upon the whole quantity of the precious metals available, and the whole quantity of commodities against which they could be exchanged.

19,190. And the actual demand for the precious metals for whatever purposes they might be wanted, and the supply of them?—Yes.

19,191. Not exclusively upon the monetary use?—Not exclusively upon the monetary supply, I think, though the monetary supply while you have open mints is always the largest supply, either for gold or for silver.

19,192. I asked the question partly because in discussing the subject myself, when I assumed that the relation between prices and money was a relation between different commodities and the commodity—gold—I found that people were assuming that I had used it in the sense of the quantity of money in circulation; whereas it seems to me that there is a very serious difference between the two ideas?—Yes, I know that the ideas as you put them forth appeared to run somewhat counter to the prevailing opinion among political economists.

19,193. Of course I do not wish to introduce personal questions, but it seems to me that the quotations that you give were not all of the same piece, as it were?—No.

19,194. That they included two different ideas and were very much distinguishable indeed?—Yes, there is no doubt, some difference between the quantity of the precious metals existing in the coined form or in the bar form immediately available for coinage, and the whole quantity, including the wedding rings and the jewellery, and all manner of uses of the precious metals, from which they are very unlikely to be taken to be converted into money.

19,195. As a matter of fact prices may vary almost indefinitely with the same quantity even of standard money, would you admit that?—No. I do not admit that at all. Commodities will vary in price through circumstances affecting each particular commodity itself. Something in the season or something in the supply or in the demand of the commodity,—of any commodity and every commodity—has a distinct influence upon its value as compared with anything else. Money being half of every bargain, the greater or less supply of money has a uniform effect.

Mr. R. L. Everett, M.P.
4 May 1894.

19,196. You assume that it has a uniform effect?—Yes, all round on all commodities.

Effect of inconvertible paper on prices.

19,197. Have you looked at any instances of the quantity of inconvertible paper with reference to the range of prices in those countries which have inconvertible paper for the standard?—I am most familiar with the conditions of the inconvertible paper of our own country between 1797 and 1819.

19,198. Did prices vary exactly in proportion to the quantity of that inconvertible paper?—I think in as near a proportion to it as those lines on the chart on the wall maintain parallel relations.

19,199. They are not quite parallel?—Not exactly, but substantially. Here is evidence given before the Committee of the House of Lords which sat in 1837 by a Mr. John Lewin, a large farmer and miller, near Wickham Market in Suffolk. He said:—"We have "always had better prices when the currency has been "expanded and when it is contracted they are lower. "I have watched for 20 years the bank circulation; the "issue of county notes expands and contracts with "it."—Banking at that time was entirely free, as I understand, and every provincial banker was allowed to issue all the notes he liked.—"When the Bank of "England has increased its issues our prices have gone "up; when they have been contracted our prices have "gone down."

19,200. But that is not the period of inconvertible paper that I am on. Have you looked at any period of inconvertible paper besides that of the beginning of the century?—No, I have not; there has been no other period that I know of in English history.

19,201. But there have been periods of inconvertible papers in other countries?—They had assignats in France, which, as they became abundant, became of such small value, and prices rose so enormously, that everything was thrown into utter confusion.

19,202. But was the change of prices even then exactly in proportion to the abundance of the paper?—Yes, they followed parallel lines, as I understand it.

19,203. But not exactly in proportion—you cannot say that of your own knowledge?—No, I cannot.

19,204. Was there not a recent case of inconvertible paper in the United States?—Yes.

19,205. To what premium did the inconvertible paper go?—I do not know, but I know that it rose to a high premium.

19,206. And then the premium fell?—Yes.

19,207. Was there not a case in the beginning of 1870 in which without the slightest change in the quantity of that inconvertible paper in a few months there was a general fall of prices of something like 15 or 20 per cent.?—In the United States?

19,208. In the United States?—I am not able to answer that of my own knowledge. They returned to cash payments in 1879, did they not?

19,209. That was long before they returned to cash payments; all at once you seem to come to a moment in which without any change you have that remarkable fall in prices?—I suspect that would be owing to some circumstance connected with the Civil War.

Dependence of prices on quantity of money.

19,210. This was after the Civil War; it was in the time of peace, after the Civil War. The point I wish to put to you is whether you are aware of these cases which illustrate the theory of the dependence of prices upon the quantity of money?—No, I have only generally read that where that paper money which was full legal tender money, has been issued plentifully, it has always been accompanied with a great rise, and that whenever they have returned from the use of that inconvertible paper money to the solid metal there has always been a great fall in prices.

19,211. But that is a very different thing from saying that prices rise in proportion to the quantity of money issued, and fall in proportion to the quantity of money taken away?—I can quite believe that the parallel of the lines would diverge occasionally, still, however, maintaining general resemblance.

19,212. In fact there is no exact proportion at all, and you have a case like that in the United States in which

Mr. R. L. Everett, M.P.

4 May 1894.

without any change in the quantity of the standard money at all, you have a great change of prices?—Indeed; I was not aware that that was so. But this is a world in which you can never get a hold of any one single influence and say: this is the only influence at work, and whatever changes grow out of this influence it is a world in which there are so many influences at play, that it is very difficult to say sometimes which is the most important influence.

19,213. Still if a Government proposes to take action on the assumption that by infusing a certain addition to the quantity of standard money they are certainly going to affect prices in exact proportion to what they add, are not these cases sufficient reason for the Government considering very carefully what really they will do?—Yes; but I think the Government would not be justified in considering that they would raise prices in exact proportion to the increase of money; they might however be certain that an increase of money would have some effect in producing a rise, but what that rise would be would be modified by other influences.

19,214. It might or might not produce the effect according to circumstances?—The extent of the effect would be modified by other influences which also might be at work.

19,215. Do you know the recent experience of the Argentine Republic?—Paper money has had an enormous effect in stimulating agriculture there I know.

19,216. But is it not the case that you have had the most rapid changes in prices without any change in the quantity of the issues of money?—That I did not know. If it is so I expect that would be owing to an apprehension that the Government would not be able to keep the money going perhaps; when they issued more it would not raise prices very much, because people would be afraid to take it.

19,217. Then other influences come into play?—Yes.

19,218. It is not merely a question of the relation between the quantity of money on the one side and the quantity of the commodities on the other side?—I do not think you can lay down more than a general principle which will be played upon and modified by the thousand other influences which are always present in human affairs.

19,219. When I was giving my own evidence you called my attention to the increase of gold which went on not only up to 1872 but for two or three years afterwards?—Yes.

Fall in prices and supply of gold.

19,220. Was not the effect of that to show that along with the increase of gold—the standard money—in the United Kingdom, the fall of prices which we are discussing had actually begun?—I think the fall did not begin until after the supply of gold in England had become from a maximum quantity a minimum quantity.

19,221. Did not the fall of prices commence in 1874?—No, I think not. I am speaking from memory, but I have got the index numbers here somewhere. I know our farming went on flourishing until 1879; 1878 was the best year as a farmer that I ever had.

19,222. I am speaking more of prices generally; I think the fall of prices commenced quite before 1879?—The first material fall in general prices, the great fall, was in 1878, I see according to the index numbers.

19,223. I am not speaking of agricultural prices, but general prices. Was there not a fall as early as 1874 even?—A small one.

19,224. Still the fall commenced at the time that gold was increasing in the United Kingdom according to the point to which you drew my attention?—I do not imagine that the gold in one single country would be a fair test, because there might be something which for a year or two enabled that country to draw to itself a larger proportion than it could keep.

19,225. Still, the question shows that the connection is a little indeterminate?—Yes. There is an undoubted very intimate connection, and you can always say that a large increase of money continued over a considerable period will be attended with a rise in price, and a contraction in the supply of money even more surely will be attended with a fall in price.

19,226. Would you say, "If continued over a considerable period will probably be attended," would that not be the more correct way of putting it—you do not know sufficiently to say that it "must be"?—I should have thought we might have said—looking at historical experience—that it must be.

19,227. But still you do not think that any addition to the standard money will raise prices, and any diminution will lower them; you speak rather of large additions continued over considerable periods, and large withdrawals continued over considerable periods?—Yes, I think undoubtedly that is an accurate way of putting it.

Mr. R. L. Everett, M.P.

4 May 1894.

Changes in currency and changes of prices.

19,228. Then with regard specially to the quantity of money in circulation, which is sometimes used in the sense of mere currency, is it not the case that ordinary changes in the quantity of currency in use follow, and do not precede changes of prices—is there not a great deal of evidence to that effect?—That the quantity of money in circulation follows the change in prices instead of preceding it.

19,229. That is, the ordinary amounts of currency I am speaking of?—I should have thought they would have proceeded side by side and step by step.

19,230. Have you read Tooke's history of prices?—I have read it, but I am afraid I do not carry it in my head.

19,231. Is that not the view which Tooke undertook to demonstrate, and which I think he demonstrated to a very large extent, because he gives continual cases of rises of price in which the movement of price undoubtedly preceded the increase of the quantity of currency?—Of course a great contraction of money in sight would produce a great effect on the minds of men. For instance, on the return to cash payments the actual passing of the measure did not affect to the extent of a pound probably the money in circulation, but it had an effect on men's minds, and they knew that there must follow a contraction in the supply.

19,232. That refers to a great change; I am speaking now of the ordinary changes in the quantity of currency which take place between good periods and bad; you have not studied the question on that point?—No, I am afraid not enough to be able to give testimony that would be very valuable. Prices have certainly to accommodate themselves to the quantity of money in circulation. The world could do its business with half the money it has now, but it would only do it by the prices being reduced one half, or something like one half.

19,233. Might it not do it by a greater economy in the use of what you have?—I do not think that affects price. Take our cheques for instance, and things of that kind; all that they do is to spare you the trouble of handing the actual standard money about.

19,234. But then they alter permanently the quantity of the standard money which you would require to use?—Yes, but I do not think that they affect prices.

19,235. Surely that has an effect upon the exchangeable value of that standard money permanently?—I do not think it has. If you take a cheque it is simply a bit of paper with an order to pay you so much standard money, and it represents the value of that standard money.

19,236. But as it is now we work our business in the United Kingdom with about 60 millions sterling of gold, and, but for the cheque system and other causes, we should have to work it with three or four times 60, would that not affect the exchangeable value of gold by creating a very large demand for it?—I am not sure, I believe there are countries in Europe, Spain and France, for instance, which have per head of the population a great deal more money than we have in England, but the level of prices is not affected by it.

19,237. No doubt the level of prices in a particular country is the same as it is in other countries because they must all act together?—Yes.

19,238. Does not the demand for the precious metals in these countries constitute a reason why the precious metals exchange for more than they otherwise would do; if these countries were equally economical with us the value of the precious metals might fall?—I am very dubious on that point, because it looks to me that all our cheques and paper representatives of money are nothing more than representatives, and when you exchange a cheque for wheat or anything else you exchange your wheat for so much of the precious metal as that cheque represents, only you are saved the trouble of actually handling the precious metal by your confidence that that cheque could be turned into that if it were required.

19,239. But surely anything that alters the quantity of the precious metals which are demanded for certain

Mr. R. L. Everett, M.P. — 4 May 1894.

purposes must affect their exchangeable value also?—I do not think economies in the way that we have them in England, minimising the actual handling of the precious metal affect the value of the precious metal in any way; they do not increase its quantity in any way, or diminish its quantity; they simply save you the trouble of handing it about.

19,240. Surely they enable you to work with 50 millions where perhaps you would require 200 millions?—Yes, undoubtedly they do that.

19,241. And if you required 200 millions, went into the market to get it, and offered commodities for it, surely prices would fall?—And yet that reasoning being correct, you would imagine that in those countries which possessed, we will say, four times as much of the precious metals per head of the population as we do, prices would be higher than they are here.

19,242. No, prices would be at the same level all over the world, but the demand for the precious metals in the form of money in that shape, in the form of currency, is one of the reasons why the precious metals exchange at a certain rate for commodities. If we require no part of the precious metals for currency then we might use them as standard money without affecting their value at all?—I am afraid I am not able to say that economies in the handling of the money enable us to do with a smaller stock of it though they really affect the value of the precious metal itself.

19,243. They do not tend *pro tanto* to diminish the exchangeable value of the metal?—I do not think they do.

19,244. Would economy in the use of any other substance tend to diminish its exchangeable value?—Yes, I think it would.

19,245. Then what is the reason of the difference between the precious metals and any other commodity?—A general lessening of the demand for wheat would probably have an effect upon the price of wheat, and a general lessening of the demand for gold ought consequently to have some effect upon the value of gold.

19,246. Still I am quite content with your general answer that you do not affirm that any addition to the precious metals raises prices and that any diminution lowers them; you confine the remark to prolonged additions on the one side and prolonged withdrawals on the other?—Yes, or at any rate large in amount—they must be considerable additions or withdrawals. Of course the larger the stock in the possession of mankind becomes the larger annual addition or contraction is required to have any perceptible effect.

19,247. Would not that depend upon whether the stocks required additions and renewals very much?—That goes on constantly; there is always the annual liability to wear and tear and to loss. That is not much of a varying quantity.

19,248. If the stocks were very firmly held, say, and there happened to be a great scarcity of production would not the value of the metal rise much more than if the stocks were not firmly held—it is not merely a question of the quantity only, it is a question of the holders as well?—Probably to some extent.

19,249. Probably to a large extent judging by the conditions of other articles?—Yes, and of course with the precious metals there is always a leakage going on, they are being taken for the arts say and the wealthier nations become the larger that consumption probably is and very little of that gets back again to coin, I expect.

19,250. That would be so; it is not merely a question of the stocks in existence?—No.

Effect of silver discoveries on agricultural prospects.

19,251. With regard to the interesting statements about the different price eras which you mentioned you would not say, I suppose, that agricultural prosperity in the two centuries after the silver discoveries was entirely due to the abundance of silver?—Not entirely, but it acted as a stimulus I think all through that period.

19,252. Would you say that the condition all through was uniformly one of prosperity over such a long period?—No, I could not say that; of course seasons come in, and wars between nations and bad laws—bad legislation.

19,253. Were there not great improvements in agriculture going on in those periods?—Yes, I should think there were on the whole. All last century as a whole was a time of fair agricultural prosperity I should think, from my reading.

19,254. I am specially speaking of the two centuries before?—That is you would start about 1600. The influence of the new gold and silver began to tell very heavily in the last half of the century of the 1500's.

Mr. R. L. Everett, M.P. — 4 May 1894.

19,255. That is what I understood you to say?—The reign of Queen Elizabeth was the period in and from which it was operating powerfully.

19,256. Would you regard that as a time of agricultural prosperity down to the 1600's.?—Yes, right away from the time of Queen Elizabeth down to the beginning of the present century.

19,257. You meant to include the 18th century as well?—Yes.

19,258. I did not understand that; I was going to ask you whether you meant to include the 18th century?—Yes, I think, on the whole, the tendency of prices was a little upwards all through the period.

19,259. Was there much rise of prices from the middle of the 18th century till towards the end of it?—No, the 18th century was a century of very steady prices if you take any period of five or 10 years together.

19,260. Until about the end of it?—Until the inconvertible paper which was generally adopted when the great and terrible French war broke out.

19,261. Was there any rise of price between 1780 and 1800?—Yes, I think there was. I remember reading in Arthur Young about that. He attributed the rise in prices to the quantities of money that were brought into England after the conclusion of a foreign war; I think that was his opinion that great quantities of money had come into the country then, and that they gave a stimulus to agricultural industry.

19,262. That was before the suspension of cash payments?—Yes, that would be hard cash.

Rise in prices of commodities and labour between 1560 and 1880.

19,263. Of course the continuous rise of prices from about 1560 down to the end of the 18th century is a very well-known phenomenon which has often been discussed?—It is.

19,264. I think that is one of the subjects of a well-known chapter in Adam Smith?—Yes, and another interesting fact is that all through last century war on the Continent of Europe instead of raising the prices of agricultural produce in England lowered them rather.

19,265. That was Arthur Young's opinion, I believe?—Yes, and you will see passages which prove that in the speeches of Mr. Western, Mr. Cayley, and several of the great agricultural members in the many debates on agricultural distress in the first half of this century.

19,266. Then the common idea about war prices being always high is not quite sound?—That is so. But then, of course, the circumstances were different. England was an exporting country on the whole most of the last century, and during a great many years in it we paid a bounty on export to encourage the growth of the export.

19,267. I believe that all through that period the rise in the price of labour was not exactly parallel to but very much in the same direction as the rise in commodities generally?—I believe so.

19,268. I have seen index numbers relating to that time; there is an index number especially of Sir George Shuckburgh Evelyn in which he puts labour along with the other commodities, and the rise in labour appears to be as much as the rise in other commodities, to the best of my recollection?—I am interested in hearing that.

19,269. You have not given attention to that?—No, I have not. Pauperism, I believe, was very nearly extinguished in England about the middle of the last century.

19,270. Then did you observe that although it is quite true that measured by many common commodities there was a great fall in the value of money in these two centuries or two centuries and a half, yet there were a good many articles whose price rather fell than rose, but perhaps you have not given attention to that point?—No, I have not. There was a general and large rise in prices, but I am not able to follow the detail in regard to individual commodities.

19,271. Take an article like sugar, for instance?—It is a curious thing, but you know sugar is an article of quite modern production. The Romans for instance

had to drink, I was going to say their tea, without sugar. There was no sugar till about the time of Oliver Cromwell I think, and they had to trust to honey and things of that kind.

19,272. I think you will find references to the use of sugar before that date?—I think not; at any rate it is only a matter of the last two or three, or four centuries; it is quite a new production.

19,273. Can you speak about the price of iron?—No, I cannot.

19,274. It is a very important article?—I cannot——

19,275. What I wish to bring out is that, although you have a general rise in certain leading commodities and in labour, yet over such a long period you have had changes in other articles—very important articles indeed—in a different direction?—I have no personal knowledge of that.

Prosperity of agriculture and condition of labourers compared at beginning of 19th century.

19,276. Then coming to the second era, was not the prosperity of agriculture at the beginning of the century partly at the expense of other industries?—My impression was that it was not so. I think our exports and imports towards the end of that period of high prices were enormously larger than they were in the next 10 or 20 years of the era that followed.

19,277. Still, I think you told us that the condition of the labourer generally was not very satisfactory during that period?—No, it was not satisfactory during the first half of this present century, but from what I have read, I have gathered that the labourers were better off in the first 20 years than they were in the second 20 years of the century, because in the second 20 years though things were lower there were hundreds and hundreds who could not find any work to do.

19,278. Still, the labourers of the early part of the century did not participate in the prosperity of agriculture to which you have referred?—They did not get their fair share; I willingly admit that.

19,279. If they had got their share, if they had got a larger share than what they did get, the prosperity of the landowner and of the tenant farmer would not have been quite what it was?—Not quite. I fancy that labourers on the farms in those days were paid a good deal in kind, so that their money wages in that period do not altogether represent how it fared with them.

Depreciation of gold at beginning of 19th century.

19,280. That was what I meant by the prosperity of agriculture being a little at the expense of other classes of the community. What was the discount on inconvertible paper at the beginning of the century?—I cannot follow the figures in regard to that. Gold at one time, I think, got to be worth about 5*l.* an ounce, did it not, measured by the paper money at the highest point of all?

19,281. It was not more, at the outside, than 20 to 25 per cent. and usually it was about 15, I think, when it was depreciated for a certain time?—Yes.

19,282. But the general rise of prices was much greater than that depreciation of the paper money?—Yes, it was much greater.

19,283. Then that was a depreciation not only of paper, but a depreciation of the precious metal, gold, as well, that you had in the beginning of the century?—The year 1799 was the most disastrous agricultural year for a long period, either behind it or before it. The year 1800 was a very bad year too. In the year 1816, they had a dreadfully wet harvest. Those circumstances had something to do. I daresay, with increasing the price, and probably the fearful war that was raging during most of that time was contributory, to some extent.

19,284. Still, using the language we use now when we speak of the appreciation of gold being equivalent to a general fall of prices in gold, would not the general fall of prices at that time, much in excess of the discount on the paper money, be properly described as a depreciation of gold, whatever were the particular causes affecting particular articles?—I think it would so far as I can see. I am aware that the rise in prices was larger than the difference between the gold and the paper money.

19,285. Then that was a depreciation of gold as compared with the time just before that; the rise in commodities was larger than the rise in the value of the gold, rather?—Yes; that would be a depreciation of gold, I suppose.

19,286. I am wishing to bring out the facts, just now, so as to have it on record that it was not merely a question of the issue of paper money which caused the rise of prices at that time?—The purchasing power of an ounce of gold during that time was considerably less than it had been in the previous time.

Mr. R. L. Everett, M.P.
4 May 1894.

19,287. That is my point. I think you told us that the effect of issuing inconvertible paper is to supersede and displace the metal it more or less represents in actual circulation?—That, I believe, has always been its effect.

Effect of issue of inconvertible paper on metal currency.

19,288. And the paper and not the metal becomes in effect the working standard?—Yes; the 1*l.* and the 2*l.* notes were the money of our fathers in those 20 years; they did not handle much else except in the way of small change.

Effect of changes currency.

19,289. Coming to the third era, that is to say, to the fall of prices from about 1815 and 1820 down to 1846 you spoke of the threat to resume specie payments about 1816 as causing a fall of prices then?—Yes. That is graphically described in the petition which I quoted which was presented by the City of London to Parliament.

19,290. Would you say then that great changes in currency matters, or even threats of changes, are apt to cause great disturbances?—Yes, that is so, and especially it was so then when the provincial banks were perfectly free, and when they issued their notes just as they liked.

19,291. And that applies generally to any great changes in the foundations of currency or money?—Yes, undoubtedly.

19,292. Have you paid attention to the recent monetary history of the United States?—I am afraid I could not bear a close examination in detail on it. I have paid a general attention to it.

19,293. Could you say whether or not the passage of the law for increased silver purchases in America in 1890, and the prospect at one time of carrying the measure for the unlimited coinage of silver in that year, produced something like a panic in the United States? I am speaking of the Sherman Law for the purchase of silver which was accompanied at that time by proposals for the unlimited coinage of silver, and I am asking whether as a matter of fact these proposals did not produce something like a panic in the United States?—There was a great jump up. Silver went up day by day, measured in terms of gold, in a way perfectly marvellous to see, and the price of wheat in England substantially followed it. I noticed that with great interest at the time.

19,294. But there was a great amount of disturbance and apprehension in the United States?—There was; and there was a great deal of speculation based upon it.

19,295. Changes of that kind therefore are full of danger in the actual making of the change?—They are sure to produce great effects.

19,296. Would you admit that the proposal to pass a bimetallic law in this country if it came to look like business would probably cause a panic at first, whatever good effect it might have afterwards?—I am not disposed to think that that would be so, because it could only be ripened to a point to pass the Houses of Parliament after a good deal of previous discussion, and the Houses of Parliament would not pass such a measure unless the greatest financial authorities whom they had in those Houses and outside had come to a general agreement that it was a wise and a right thing to do.

19,297. Still the proposal in the United States in 1890 did cause something like a panic?—The free silver party expected then to carry a measure for the free coinage of silver, but in the end the forces arrayed against them were so mighty that the question was compromised by the Sherman Act.

19,298. And there was a great amount of apprehension and disturbance of people's minds in the United States in consequence of these proposals?—They produced a great effect on the gold price of silver—very greatly to the advantage of everybody who had commodities to sell or who had silver securities.

19,299. But beyond that was there not a great amount of panic and apprehension in the United States in that year finally culminating in a very serious money panic indeed—much more serious than we had in this country even with the Baring crisis?—The money panic in

Mr. R. L. Everett, M.P.

4 May 1894.

America was some time after that, was it not, and could not be directly connected with it?

19,300. But the period of apprehension began before and went on for a long time; is that not so?—I must say that to me the great outcries which we read in the London papers about the shortness of money in America and the danger of their proceedings under the Sherman Act appeared to be gross exaggerations of actual truth.

19,301. But was there not an actual foundation for those statements in what was well known to be going on in the United States at that time?—Gold was coming away from there here, but that was the only foundation for it. They tell me that when the great crisis arose in America the silver certificates were at just as great a premium as gold itself, and that the difficulty was to get money in any form.

19,302. Still you admit generally that such changes are apt to cause a disturbance, and sometimes panic?—They are undoubtedly.

19,303. But you think in particular for the reasons which you gave, that the attempt to pass a bimetallic law in this country might not have those effects?—My opinion is that it would not, because we should walk up to it by gradual steps, and the judgment of the country would concur with it before it would actually be done.

Proposal to introduce bimetallism in 1830.

19,304. But you are quite aware that when a proposal was made in this country in 1830 to introduce a bimetallic system, the answer given to it at that time was "You must not speak of such things, because if "you do you will have a panic"?—Mr. Huskisson used such language, did he not?

19,305. Lord Althorp, I believe, when in the Government of which Sir Robert Peel was a Minister, and Sir Robert Peel himself was very much opposed to the proposal; one of the grounds taken was that if you attempt to make such a change you will have a panic, was that not so?—I believe, in the course of discussion, statements to that effect were made, but there were a great many statements made.

19,306. Still, that was not merely an ordinary statement, but the deliberate ground taken up by the Executive Government of that time?—Of course we continually hear statements made by great authorities in the Houses of Parliament which go in at one ear and out at the other.

19,307. Still that was the ground taken up by the Government at the time, and it is in general accordance with the opinion which you have expressed that great monetary changes are likely to cause disturbance and panic?—Yes, I think there is no realm of human affairs in which it becomes you to be more careful, and sure of the ground on which you are going to set your foot down next, than in this realm of monetary legislation. It has wrought many evil consequences in the past, and a good many of the great steps that have been taken have been taken, I am afraid, very much in the dark.

Effect of Sherman Act in the States.

19,308. You had a great deal of panic in the United States about two or three years after the passage of the Sherman Act, when the question was raised whether it ought not to be repealed or not?—Yes.

19,309. Currency questions of that kind may not produce their full effects all at once, but may produce panic very shortly after when their effects begin to be felt?—The legislation which took place in America under the Sherman Act satisfied nobody; it was altogether short of the true bi-metallic theory.

19,310. But as a matter of fact it became a very serious matter indeed from two to three years after the passing of the Act, and disturbed the whole foundations of business in the country?—I confess I could not see the connexion between the two events. The difficulty in America arose from want of money, and it seemed to me a very strange thing to say that a measure which added eight millions a year to their full legal standard money could be one of the means which made them short of money.

19,311. But as a matter of fact there was great commotion and disturbance in men's minds?—There was, which was I was going to say very skilfully wrought up from London by our papers as it appeared to me.

19,312. But as a matter of fact you admit the commotion and the disturbance?—Yes, certainly.

19,313. And although the money of the United States in circulation had increased very much two or three years before 1893 yet the effect was the same as a contraction of money—they had not money to carry on business with on account of the discredit?—If I remember aright alongside of this great increase of money under the Bland and Sherman Acts there was also proceeding a retirement of their legal tender paper money which this increase of the silver money only just about made up for.

19,314. Is that quite so?—I am not sure of the exact figures.

19,315. Are you not speaking now of the withdrawal of the National Bank notes?—Yes.

19,316. There has been no withdrawal of the legal tender money of the Government since about 1867 or thereabouts; it has been absolutely prohibited by law?—You mean the Greenbacks I suppose.

19,317. Yes, the Greenbacks; there has been no possibilty of withdrawing Greenbacks but in consequence of taxation I believe a good many years ago the national banks found it no longer profitable to continue the issue of their notes, and their notes for some years diminished; is that not the more likely explanation?—I know that they have several kinds of paper money in circulation in the United States, and I have read that during recent years there has been a continual contraction of that paper money.

19,318. Did not the contraction of the bank notes practically come to an end several years ago?—I thought not.

19,319 You are not acquainted with the facts in detail?—No, but I have had under my eye again and again the reports of different bodies in America as to the different kinds of money in circulation there.

19,320. I believe I may say with absolute certainty, having followed this point very carefully, that the contraction of the bank notes came to an end some years ago, and that there has been no further contraction since—I cannot say what has been going on within the last few months?—Of course you are as high a statistical authority as the world possesses, but I certainly thought I had read within the last two or three years reports from official quarters in the United States which showed that the volume of paper money there was still being decreased, and decreased to as large an extent as the additions of hard money that were made by the Sherman Act. But I have not such figures within my reach now. I will look at that again, but of course I accept you as being an authority of the very highest character in regard to facts like that.

19,321. As a matter of fact you would not be prepared to dispute that for two or three years before 1893, the amount of paper and other money in the United States had increased—putting it all together?—No, I should not, but I did not think it was so.

19,322. Yet, in spite of that, you had a great feeling of contraction and scarcity of money in all quarters?—Yes, and everybody who had money was hoarding it as I understood. I carefully inquired whether any difference was shown with regard to the silver certificates and I was told: No, they were at just as much at a premium as any other form of legal tender.

19,323. So that that was another illustration of the point that the same quantity of money has different effects at different times, according to the state of men's minds?—Yes, that is a very pertinent illustration. They had the money in the country, but a panic fear kept it shut up so that they could not use it.

19,324. Is it not a common case that after a period of panic the quantity of money in circulation diminishes?—Yes, I should think it is. Timid people who have got hold of any money hide it up and stick to it.

Effect of panics on quantity of money in circulation.

19,325. And money begins to be abundant to those who use it, although there is actually a less quantity of it about than there was just in the time before when everybody was short; that is a common feeling?—Yes, when the panic is over, the money begins to come out of its hiding places again.

19,326. The fall of prices which took place in 1820 and afterwards, was a fall of prices during a period when, I think you have told us, there was an effective double standard maintained by France?—Yes; the existence of the double standard could not save you from the effect of a great retirement of legal tender paper money, which paper money had also been put in circulation, as I understand it, on the Continent of

Europe as well as in England. They also were trying to get back to cash payments at the same time as we were.

Effect of double standard on prices.

19,327. Still you admit, then, that a double standard by itself is a standard with which you may have a very considerable fall of prices?—Yes, if you once allow legal tender paper money to come in in a large volume, and then retire it.

19,328. But whatever the cause, you admit that it is the case that with the double standard, you may have a great fall of prices as well as with a single standard?—That is hardly a fair way of putting it, because the double standard was in suspension during those 20 years. They had introduced practically another standard, which displaced it for 20 years, and then when they reverted back they had the transition to make from the 20 years of another standard.

19,329. Was there not the same thing in 1873, when the United States were making a transition from paper to a metal standard?—They made that transition really in 1879, did they not, when they resumed cash payments?

19,330. In 1879 the resumption took place, but still that was also a transition from a paper to a metallic standard?—Yes.

19,331. So that I am quite right in comparing the period from 1820 downwards with the recent period, as both periods in which there was a general fall in prices, the one being a fall of prices in a double standard, and the other a fall of prices in a single standard?—Yes, I think whether you have a double or a single standard, if for a considerable period of years you break it off and interpose a paper money standard, then when you go back from the soft money, the paper money, to the hard money again, you are almost sure to have a catastrophe.

19,332. There is a liability to a fall of prices in a double standard just as there is in a single standard?—But I do not admit that in either case a double or single metallic standard was in operation during these periods of the paper money.

19,333. But metallic standards were in operation in the period first of all from 1820 to 1846, and then in the period from 1873 to the present time?—Yes.

19,334. There were metallic standards in both cases?—Yes.

19,335. In the one a double standard; in the other a single standard?—Yes.

19,336. In both cases you have had a general fall of prices?—Yes; but your fall was only coming down from your balloon—your paper money to your metallic standard again.

19,337. Still a double standard is not a preventative of a fall of prices when the circumstances favour it?—Not if you suspend it and introduce a period of paper money standard.

19,338. Is it a preventative of a fall of prices at any other time?—I think it is. Of course there is no absolutely perfect standard.

19,339. Still the facts you have stated to us do not seem to indicate that there is any difference in point of usefulness between a double standard and a single standard?—The great difference between the two is that the one depends upon the variations in the supply of one metal only and the other upon variation in the joint mass of the two, and the experience of history tells us that over periods of considerable duration the joint supply of the two metals is a very much steadier quantity than the single supply of one of them.

19,340. But considering all the facts which we have been bringing out as to the indeterminate character of the relation between the quantity of the precious metals and prices, have you any facts to show that prices are steadier when there is a double standard than where there is a single standard?—Yes, I think all last century, for instance, when we had the joint standard we had very steady prices.

19,341. Have not prices been very steady in India with a silver standard?—Yes, silver has in recent centuries been a very stable standard.

19,342. Supposing they had had a double standard, supposing all the world had had a double standard, what would the range of prices have been in India probably with that double standard? Would they have been more or less steady than they have been with a single standard?—I think they would probably have continued about equally steady, because we had enormous discoveries of gold at one time, and now we have been recently having very large ones of silver.

19,343. Then the prices of the world would have been silver prices?—They would have been prices based upon the double legal tender.

19,344. I am merely speaking on the question of steadiness, and I am giving India as an illustration of a steady single standard?—Mr. Courtney used a singularly happy illustration, I thought, in a paper he read the day before yesterday at the Mansion House. He was standing then, and he said: I stand on my two feet, but I never have exactly the same pressure on one foot as on the other; sometimes a little more on one and sometimes a little more on the other; but still I am always on the two, and being on the two I stand much firmer than if I stood on one alone. I thought that exactly fitted this particular subject.

19,345. My opinion is that these kind of illustrations are apt to be a little misleading, and I wish to get at the facts. Have you any evidence to show that prices are likely to be more stable with a double standard than with a single standard?—I think there is most ample evidence of that.

19,346. What is it?—The influences which vary prices as measured by the precious metals are changes either in the supply or the demand. Now if you take the question of supply, the experience of history unquestionably is that you have a steadier annual supply of the two metals jointly than of one separately. Then, if you come, on the other hand, to questions of demand, if you have the two metals in joint use you escape such fluctuations as we have been grievously suffering from in the last 20 years by one or more nations suddenly changing from the use of one of these metals to the other.

19,347. That is a theoretical statement?—It is a very painful matter of fact which many of us agricultural people are groaning under and suffering from at this very moment.

19,348. I have just been pointing out to you, and you have admitted, that with a double standard you had a great fall of prices between 1820 and 1846?—Yes.

19,349. And that with a single standard in recent years you have also had a fall of prices; then I have pointed out to you that in India with a single standard you have had stable prices over a long period. Now I want to know not whether you can give me a statement that prices with a double standard ought to be more steady than prices with a single standard, but whether you can give me any illustrations from experience that prices as a matter of fact are steadier with a double standard than with a single standard?—I must respectfully say that I do not think you quite fairly deal with the double standard in the period after 1819 because it was the fact that that standard had been suspended for 20 years which made the great fall in prices when we returned to it.

19,350. But it was only suspended in England, and in England we did not return to the double standard?—I remember in the report on agricultural distress in 1821 and 1822 it is stated that we were getting back to cash payments at the same time that other nations in Europe were doing the same thing, so I suspect they suspended the use of coin a great deal too.

19,351. Still you do not know the facts very exactly yourself?—No.

19,352. You cannot give me any illustrations then of actual steadiness of prices under a double standard greater than what there is under a single standard?—No, I think not. The prices through last century were very stable under the double standard, but the prices in India under the single standard have been equally steady.

19,353. Have you any opinion as to whether gold and silver are more likely to rise in value from the present point or to fall in value; have you any ideas on the subject?—As compared with one another do you mean?

Course of gold and silver prices compared.

19,354. Is it more likely now that gold prices will rise supposing you keep the present arrangements in existence or that silver prices will rise?—I think that gold prices are certain to go on falling if the present arrangements continue.

19,355. And silver prices?—In silver standard countries, do you mean?

Mr. R. L. Everett, M.P.
4 May 1894.

19,356. Everywhere. Of course if they fell in standard countries that means a universal fall to all intents and purposes?—Gold is now used over a very large area, and if further demands are made for its use in India it will inevitably rise in value still more, and prices measured by gold will go down.

19,357. It is also quite possible that it may be more likely that gold prices will rise from this point than that silver prices will rise from this point, and that therefore, as far as agriculture is concerned, it will be better to stick to gold than to put the gold and silver together, because with the two you would have a smaller rise of prices than you are likely to have with gold alone?—I do not think we can possibly stay where we are. The difficulties in India are gathering fast and thick, and it is inevitable that something will be done. They may try to put India effectively on a gold standard, and if they do that it will create so large a fresh demand for gold that prices will go down, so that the fall of the past will be child's play in comparison with the fall of the future.

19,358. Then you do not share the opinion that a gold standard is impossible for India?—I think it would produce such a catastrophe in gold standard countries to attempt to effectually introduce it that it would probably break off the process and lead to a thorough reconsideration of the whole monetary question.

19,359. Still it is a matter upon which, as agriculturists, it would be expedient that those interested should form an opinion as to whether they might not be better off by sticking to gold and taking their chance of a rise of gold prices than embarking in a course which perhaps might make them rather worse than they will be if they stick to gold?—Yes, and what will come depends, I think, mainly upon what will be done in regard to India.

Opposition to inquiry into currency between 1820 and 1846.

19,360. Can you tell us generally the cause of the opposition to an inquiry into the currency which was so emphatic in Parliament between 1820 and 1846?—No; that is rather difficult to explain, because the agricultural party had immense influence then. The landed interest was very powerful in the House of Commons and in the House of Lords, but in spite of that the money lords appear to me, as I read the history of those times, to have proved themselves much stronger than the landlords.

19,361. But they must have had some reasons, and they must have assigned some reasons, for their continual opposition to an inquiry into the currency?—The reasons that they assign were, mainly, "We have come "into dreadful suffering through having departed "from the metallic standard to the paper and reverting "back to the metallic standard after a long period of "the use of the paper, and now having made that "change and got on to the solid metal again, we had "better endure the evils we have rather than make "any further changes."

19,362. Was not that a very good reason?—There was a good deal of weight and force in it.

19,363. Having made a change which on the whole they saw to be beneficial in spite of certain disadvantages attending it, they made up their minds that they would not disturb people's minds, and would have no further changes in the currency?—Yes; there was no doubt a great deal of force in that.

19,364. Then in what you told us you did not mean to impugn the wisdom of the course which the great majority of people took at that time?—I think in 1819—in the light that we have now, they would have been wiser if they had then decided that a certain quantity of inconvertible paper money should have been kept afloat. They should have returned to cash payments, but they should have kept a considerable quantity of the inconvertible paper money afloat along with it.

19,365. I do not quite follow that?—We now issue a certain quantity of paper money, which is full legal tender—it is about 15 or 16 millions, is it not, that the Bank of England is entitled to issue beyond what they have bullion or coin to represent?

19,366. Was not the position still more favourable in 1819-20, when the Bank of England was not bound to keep any bullion at all except what was necessary to pay the notes on demand?—I think the Legislature at that time should have avoided the sudden contraction of the currency which ensued by getting rid of all this inconvertible paper money, and that it should have kept a certain quantity of it afloat.

Mr. R. L. Everett, M.P.
4 May 1894.

19,367. How can they avoid contracting the currency if they make paper payable on demand; does not the currency regulate itself after that?—The Bank of England are obliged to give you gold for a note if you carry it to the Bank of England, are they not? But their notes are themselves legal tender anywhere else.

19,368. Yes, but the Bank of England is obliged to pay them on demand; therefore the Bank of England does not regulate the issue of bank notes. I wish to get at your idea as to what should have been done?—I think I can see what they ought to have done, though I cannot quite tell you whether it could have been done. What they ought to have done was to have kept the volume of money from diminishing so rapidly. If by any means they could have kept, for instance, 10 or 15 millions of this paper money afloat along with the gold it appears to me they would have been wise to have done it.

19,369. If they went back to a gold standard, how could it have mattered what was the volume of money in circulation? Is not that the opposite idea to what you rather assented to in the earlier part of my examination?—We are on a gold standard now, but though we are on a gold standard we have afloat as legal tender money some 16 or 17 millions of paper, I think, which the Bank of England are empowered to issue, but which they do not hold bullion against.

19,370. Still, they pay on demand?—I suppose they would have to find coin for that if people ran on them enough.

19,371. And if it be on demand, surely it is not necessary to have your paper represented by bullion to the full amount?—No.

19,372. That is not the common practice of mankind now?—I wonder whether they could not at that time have had a larger quantity of the paper money left as legal tender without having to keep the metal against it.

19,373. Practically there was nothing they could have done in all that period by inquiring into the currency because there were no changes that they could make, or intended to make, that were likely to cause a rise of prices or to benefit the agricultural interest?—I am inclined to think that was so when once cash payments had been reverted to. There was some proposal made then to change to a silver standard, but with the light that we have since got upon facts we now see that though England adopted a single gold standard in 1816 we really had all the benefits of a double standard, because other nations by their double standard kept silver and gold through the world at par.

19,374. Assuming that the double standard was a good thing, and had the effects you suppose, we had all the benefits of it?—Yes.

Proposal to introduce bi-metallism in 1830.

19,375. But there were actually proposals to introduce bi-metallism as a remedy for agricultural distress?—Yes. Mr. Western or Mr. Cayley introduced a measure for the silver standard, I know, and they had an interesting debate about it.

19,376. Mr. Attwood proposed bi-metallism in 1830 in the House of Commons?—Yes.

19,377. And there was a debate at that time?—Yes, there was.

19,378. What was the ground he alleged; what was his object?—There was a little difference then between silver and gold. I think he reckoned there had been three or four per cent. difference.

19,379. Mr. Attwood, I believe, made this remark: "Now suppose the legitimate standard re-established, "that double standard, which the hon. member finds it "so difficult to understand, let him be satisfied that his "debtor will find no such difficulty; he will see at "once through the mystery. The debtor will no longer "pay gold money as now compelled; he will pay in "silver money, of the ancient legal coin of 5*s.* 2*d.* the "ounce, which when the hon. member carries to the "bullion market he will be able to dispose of at no "more than 4*s.* 11*d.* the ounce. He will lose five per "cent., which his debtor will gain, or, in other "words, will have to give up an advantage of five per "cent. which the present law has unjustly, and in "violation of the faith of contracts, given to all "creditors over all debtors." That was the exposition of bi-metalism at the time, that they wanted to pay five per cent. less than they would have to pay under the gold standard?—Yes.

19,380. That is not the idea of bi-metallists now, is it?—The idea of bi-metallists now is that by all this recent legislation against silver the contracts which we entered into rendering ourselves liable to pay a fixed quantity of gold have been artificially rendered a great deal more onerous. They have not altered in the quantity of gold we have to pay, but artificially so great an increase in the demand for gold has been created that the real burden of our debts has been cruelly raised upon us.

Effect of legislation against silver on debts.

19,381. Then do you propose now to pay five per cent. or any other per-centage less than what you would pay if you were to continue paying in gold, is that the idea?—I think that the value of gold would be lowered by bi-metallism.

19,382. So that, although there was still nominally gold, people would get less?—Yes, less value undoubtedly.

19,383. But you have not that idea that you are going to pay so much silver, at less than the market price, and then be satisfied that you have got rid of your debts on easier terms?—I think the gold sovereign of 1895, if we had bi-metallism carried out then, would probably return to the value of the gold sovereign of 1875, say.

19,384. But still that is a matter of speculation?—Yes.

19,385. And immediately if you propose to have bi-metallism at anything different from the present ratio, say instead of 33 to 1, or something like that, to make it 25 to 1, or 20 to 1, or perhaps 15½ to 1, that would be giving an enormous advantage to the debtor compared with anything that Mr. Attwood was offering in 1830?—Yes, it would.

19,386. When it was rather contemptuously rejected?—Yes. But I look upon it as a restitution. The creditor has cruelly robbed me, and I should be getting back again what he had unjustly taken from me.

19,387. Then you sympathise with Mr. Attwood?—Yes, I do.

19,388. Would you adopt his account of the change which is proposed in some quarters?—Yes. We have empowered Shylock by our change of the law to take our life blood as well as his pound of flesh.

19,389. But is it not the case that the great majority of obligations existing at the present time are obligations which have been quite recently created?—No, I do not think that is so; no, the bulk of the mortgages and the national debt—by far the larger part of the obligations of this country—were contracted before 1873.

19,390. Surely there are debts being created every day?—Yes, that is also true.

Effect of bi-metallism on creditors.

19,391. As far as the ordinary commercial business of the country is concerned the obligations have been created quite recently. If you change the money the man who is to receive say 100*l.* to-day, by your proposal, if the bi-metallic law were quickly introduced, would receive only 75*l.* or 60*l.* in a few weeks hence?—He would be practically a poorer man—the creditor would suffer to some extent.

19,392. But would he not suffer enormously?—Well he would.

19,393. Is it not a great change that you make?—He would suffer a great deal I think. But the great prosperity of the producing classes, and the abundance of employment, and the general stimulus that would be given to industry, and the greater security of the investments that he had out, would, I think, to some extent meet that.

19,394. What ratio do you think ought to be fixed now if a change of that kind was introduced?—My own individual opinion would be to go back to very near the old ratio.

19,395. That is to say, you would enable a man who owes 100*l.* now to pay it with 50*l.*, or something like that?—Gold would be lowered no doubt in value.

19,396. Then it would be an enormous change in the immediate circumstances of the times?—Yes, it would.

19,397. Would it not cause a great revolution and a great panic in monetary circles?—Of course human beings are very curious creatures, and you can never tell what panic there would be, but as I say, you cannot make a change like that without leading up opinion to it, nor until opinion is ready for it which would conduce to prevent panic.

19,398. Take the case that the banking community is indebted to depositors to the extent of 600 or 700 millions sterling at this moment. Would not all these depositors go and get their money in gold at once, if there was a chance that by waiting two or three weeks or two or three months they would only get 50*l.* where they are now entitled to 100*l.*?—I do not think they would because they would get nothing by it. In either case they would get the same number of sovereigns, but under bimetallism they would be of less value.

19,399. They would get 100*l.* instead of 50*l.*?—They would have to invest their money again if they drew it out, and when they went to invest their money under bi-metallism their sovereigns would be of no more value than they would have been if they had left them in the bank.

19,400. They possibly might have a different opinion?—They might; you cannot account for that.

19,401. Then if they should have a different opinion you would have a tremendous panic?—Yes, but look at what we are facing now. As you made out in your evidence when we examined you, the loss to the agricultural classes in Great Britain alone is something equal to the whole amount of the National Debt in the last 20 years. The value of our landed property is contracted by 600 or 700 millions. In addition to that the property of mill owners and of iron masters and of all the great industries of England has contracted too and is still contracting. I expect we have suffered a loss of thousands of millions in the contraction of prices in the last 20 years.

19,402. Still if you are going suddenly to throw that loss upon another class would they not endeavour to prevent it, if possible, and so bring about that panic which seems to be quite certain to come if you propose to make such a change?—You cannot account for wild panics seizing people if they do not go by reason.

19,403. Is there any prospect of any class submitting to so great a change without trying to prevent it in the most energetic way that they can?—I do not think that calling in their money would prevent it in the least degree.

19,404. But you might have a panic?—If you called in your sovereigns and took them home with you——

19,405. You might have a panic in that case?—They would yield you no interest while you had them at home.

19,406. You might have a panic all the same?—Yes, you might.

19,407. And that would be a tremendous calamity?—I think we are very likely to have a panic now if values go on wasting. You do not know what is safe.

19,408. You are admitting the possibility of a panic if a proposal to pay people in silver at the ratio of 15½ to 1 should be made within the next few years?—I do not think there is a probability of it; of course there is a possibility. You must remember that there is an enormous mass of silver coin circulating to-day in different countries at 15½ to 1. Our own circulates at less than that. There is an immense amount of silver coin in America, in Prussia, and in France also circulating at that ratio.

19,409. Still, you cannot pay your debts to an unlimited extent in a country like England with silver?—No, but in France you can.

19,410. In France you cannot pay with silver to an unlimited extent?—I think you can.

19,411. That would make an enormous difference?—Yes.

Influence of supply of money on industrial property between 1850 and 1879.

19,412. Coming to the fourth era, I assume that you do not put it forward that the prosperity from 1850 to 1879 was entirely due to more abundant money?—I think that was far and away the most important factor. There were several wars in that period, which in the present condition of things as between England and other countries did undoubtedly tend also to raise the prices of agricultural produce in England.

19,413. Would you say it was the most important factor?—Yes. I think it was decidedly the most important factor, and still more as regards the general industries of the country than as regards the agricultural industry of the country.

19,414. Simply the abundance of money?—Yes, there was a constant flood of new money pouring in through

Mr. R. L. Everett, M.P.
4 May 1894.

the mints which was set to work in all kinds of industrial processes.

19,415. Would that influx of new money have had the same effect or much the same effect if you had had no railway extension, no extension of the telegraphic system, and no extension of steam shipping throughout the world, and none of the manufacturing inventions which took place?—That new money really carried out all those great improvements that you spoke of. It was the flood on which they floated, and the profit on all kinds of industrial occupations in those days stimulated men's brains into unusual activity. It paid you far better to be a producer than it did to be a drone. A like stimulus was given the human intellect during the rising prices of Queen Elizabeth's reign.

19,416. Was that quite so as a matter of fact, that this formal change in the notation of the values was so material in the actual prosperity of the times; is that really what we are to understand?—Yes. I think the great inducement to men to enter into all kinds of industrial pursuits is profit, and the thing that makes profit is an increase in price.

19,417. Would you say that the real prosperity of the country was greater during 1850–79 than it has been since?—No, I think the consequences in these cases remain some time after that which has produced them, and that we did not reap the full benefit of what was going on in those years of extraordinary industrial activity till after we had got through them. Their good effects went on by a kind of momentum some time after the cause which had induced that extraordinary activity had ceased to operate.

19,418. In what way did the good effects go on?—You had had an enormous mass of production and invention, and an extraordinary demand for labour. That put labour into a better position, and enabled labour to claim a larger share of reward out of what was going. Good effects of that kind were felt I think.

Accumulation of capital in 1850-79.

19,419. Was there a much greater investment of capital between 1850 and 1879, year by year, than there has been since?—The per-centage of production was very markedly greater during those years than it was after those years.

19,420. Then unless there was a greater saving in those years there must also have been a greater consumption than there has been since?—We produced, I suppose, in those years more than we wanted.

19,421. I understood you to say that we were preparing in those years for the prosperity which has been enjoyed since?—Yes.

19,422. And which you admitted?—Yes.

19,423. Then I put the question whether there was a larger saving of capital in those years to prepare for the prosperity which has been enjoyed since?—I did not quite catch that point. I think undoubtedly that we were saving money then, we were accumulating all kinds of good things for man's use at a much more rapid rate than we had been.

19,424. Have you any evidence of that?—I have seen the figures somewhere of the rate of production. I think it is in your "Wages and Prices Compared," and that you show that the rate of production as compared with the population was higher while prices kept up than it has been of late years.

19,425. As far as my own figures go I think what they show is that there was a greater nominal accumulation say between 1865 and 1875 than at any other time, a very great increase of values, but that is a very different thing from saying that there was a great increase of things themselves which we must deal with in a question of real prosperity?—Every cultivator of the soil in those prosperous times vied with his neighbours to make the earth produce more and more. You remember Mechi, and all the talks he used to have, and how he used to urge upon people to do away with our useless hedgerows, and to buy all manner of foods and manures on to our farms to farm higher and higher in fact.

19,426. Still this is a question of degree, is it not, and I am speaking not merely with reference to agriculture but with reference to industry generally to which you refer. Is there any evidence to show that the real prosperity of the country before 1873 or before 1879 for any considerable period was much greater than it has been since?—I think the masters, the employers, the captains of labour, were making a far larger return then, than they have done since.

19,427. Still that is not the real prosperity of the whole country, that is a question as between class and class that you are coming to now?—Yes.

Mr. R. L. Everett, M.P.
4 May 1894.

19,428. You admit, I suppose, that there never has been a time to be compared with recent years for the prosperity of the labourer?—I think that is so except in regard to the matter of employment. I think that his employment is not so constant and certain now.

Distribution of profits between employers and employed.

19,429. Have you any evidence of that?—I have gathered that from the reports I have seen of labour organisations.

19,430. Are not the bulk of the people employed in industries which are fairly steady such as domestic service and railways?—Yes, those are things which are probably going on as steadily as ever. I happen to know some large employers in several different branches of industry beside agriculture, and they all tell me the same tale that if they had gone out of business 10 or 15 years ago they would have been richer men than they are to-day, and though they keep their concerns going they are not making anything like adequate profits out of them.

19,431. Is it not a question of distribution, and that what one class of the community has not enjoyed another class has?—Yes. I think as you descend from a time of great industrial activity and large business profits to a time of falling prices and falling profits, there is for a series of years a considerable movement of benefit from employers into the hands of those who were working for them.

Cause of abundance gold and silver between 1850-1879.

19,432. Then, with regard to the abundance of gold itself, that is practically our money, for this period from 1850 to 1873–79. Was it not due in part to such a cause as the inconvertible paper money of the United States?—No doubt that helped to swell the whole legal tender volume of the world.

19,433. It was not merely that bi-metallism practically existed and that all countries had bi-metallism or the benefit of bi-metallism?—I think it was an added fact that there was an inconvertible paper money in considerable quantities in several countries.

19,434. If I recollect rightly in that quotation which you gave us from the speech of Lord Beaconsfield in 1873 he referred to the existence of inconvertible paper money in France?—Yes, I think he did.

19,435. That also would be a cause in the latter part of the period—towards 1873—of a swelling of the abundance of money?—Yes. I expect that that is really one reason why war raises prices in these days, because generally when a nation gets involved in a serious war it makes large issues of paper money and the coin, I suppose gets out of the country to some extent, and the whole volume of legal tender money is swelled a good deal.

19,436. In fact the metal is economised and becomes of less value in exchange in consequence?—Yes, and there is more legal tender in use.

Cause of contraction of gold since 1873.

19,437. Then coming to the fifth era, is it your opinion that the contraction of gold since 1873 is not only due to monetary legislation, but to monetary legislation against silver?—The annual supply from the mines we know for some 20 years became considerably less than it had been, but I imagine that was a much less powerful factor as dealing with the value of gold than the enormous new claims made upon gold by the change of standard made by nation after nation from about that date.

19,438. With regard to these claims upon gold you say that they arose through the demonetising of silver?—Through legislation against silver, yes.

Demonetisation of silver by Germany.

19,439. That would be so, I should imagine nobody would dispute, with reference to Germany?—Yes.

19,440. Which actually called in silver and demonetised it and sold a portion of the product upon the markets of the world?—Yes.

19,441. So that Germany from being a consumer of silver for the moment became a seller?—Yes.

19,442. That was a considerable change?—Yes, it was.

Resumption of cash payments in United States.

19,443. But with regard to any other great country was there any change of a similar kind quite to the same degree?—It was supposed that the United States absorbed from 80 to 100 millions of gold I think when they resumed cash payments.

19,444. But still that was not a change from silver to gold, it was a change from paper to gold?—Yes.

19,445. And in Russia a considerable demand for gold arose, in late years especially, but not from any currency change?—No, I suppose that was for hoarding for supposed contingent war purpose, I do not know.

Demand for gold in Russia.

19,446. That is supposed to be partially the explanation; nominally the gold is held against the issues of paper money I believe. Still that was a matter about which they exercised choice; they might have chosen to take silver, and they chose to take gold?—They did not really alter their legislation about any money ratio I think, did they? they did not change their standard.

19,447. Practically, I believe Russia has had inconvertible paper for an indefinite time—they have long since departed from any metallic standard in the matter?—On the face of their notes I think their promise is to pay either silver or gold, but I suppose in practice you could not get that carried out.

19,448. There has been no effective promise to pay within memory so far as I know. The demand for Russia therefore was not the consequence of any monetary legislation directed against silver?—No, I should think not.

Effect of demand for gold in United States.

19,449. Then with regard to the United States, can you say that the demand for gold for the United States was directly the result of legislation directed against silver?—I think that is the correct way to describe it.

19,450. You mean to say if the United States had not passed that law of 1873 to which you made reference, that in resuming specie payments they might have resumed specie payments in silver?—Yes.

19,451. But, as a matter of fact, the change in the United States was not from silver to gold, but from paper to gold?—Yes; the use of the metals was in suspension as it had previously been in England during the time of inconvertible paper money, but if they had not altered their law when they resumed cash payments it would have been open to anybody to bring any quantity of either metal equally to the mint to pass into legal tender money, and had the mint remained open it would have been impossible for silver and gold to have diverged wider than 16 to 1 which was the ratio at their mint.

19,452. Still a change from paper to gold is of a different nature from a change from silver to gold?—Yes.

19,453. You cannot say that any silver has been displaced by the change?—No. I think the evidence before the Gold and Silver Commission went to the effect that there have been as large demands for silver after all this legislation as there had been before.

19,454. I gave evidence to that effect myself, just as I have given evidence before this Commission, and I believe there is no doubt about the fact that the common impression that silver was actually displaced by the legislation of 20 years ago is not true; that is not exactly what happened?—No; an immense new demand was opened for gold, and there was legislation which you might call hostile to silver, but silver found enough other outlets, so that the demand for it and the use of it continued to be quite as great as it had been before.

19,455. And except in Germany there was no actual displacement of silver that had been in use just before?—No, I suppose that is so. It is a fact well worth keeping steadily in mind.

19,456. Then with regard to the United States, you speak of the legislation of 1873 as hostile to silver, but was it not the case that that legislation was merely in continuation of the practical system of money which had been established in the United States from about 1836?—I think that the monetary arrangements of France had continued substantially unchanged from 1803 when they adopted the 15½ to 1.

19,457. But I am speaking of the United States?—I beg your pardon, I was thinking of France: if I understand it aright, France has not altered her legislation.

Use of gold standard in United States since 1836.

19,458. And the United States has not substantially altered its legislation pointing to a gold standard since 1836?—Yes. I think most decidedly. From the founding of the United States, silver and gold equally were their full tender money. Their first ratio was 15 to 1, but under that ratio all their gold went away, because there were other countries where it was worth more and they found themselves only with silver. So they said: "Now we must alter our ratio," and unfortunately instead of making it 15½ as it was in France, they went from 15 to 1 to 16 to 1, and then just the reverse thing happened; all their silver went away and they were left chiefly with gold.

19,459. Was not that the object of it?—No, I think the object of it was that they should keep them both in the country circulating side by side.

19,460. But still they intended to have gold as their principal money?—I do not think that there was any intention of that, because the dollar has always been the great coin of the United States.

19,461. Did they not in 1850 pass legislation for the purpose of having token money of silver so as to serve side by side with the gold which they had; sufficient silver for all the purposes for which they wanted silver?—In 1850?

19,462. In 1850 or thereabouts?—That fact I was not aware of, if that is so.

19,463. The effect of that was that, although the United States still had a bi-metallic law in their legislation, yet, as a matter of fact, they were considered to be a gold using and a gold standard country, so that when they resumed specie payments after the close of the war, the natural expectation was that they would resume in gold and nobody thought of silver. I am putting it that the legislation of 1873 was really formal and not substantial, but was to carry out a monetary policy which had been decided upon long before?—There is no evidence of that in the debates. I have read a great many of the debates in their Houses of Parliament since this question has been so hotly discussed. They contend that this vital change made in 1873, was made without the knowledge of the people, without the knowledge of the Parliament itself, and without the knowledge of a good many who voted for it.

19,464. But as a matter of fact it was perfectly well understood in Parliament, as Bills pass through Parliament, adequate explanations being given to those who cared anything about it?—I know one Senator or member of the other House said, in a recent debate, that he asked expressly when the new law was passed whether it made any material alteration in the law, and they said, "No, it was simply a codification of "the existing law, it was a consolidation Act or "something of that kind."

19,465. Might not that opinion have been quite honestly held in view of the circumstances which I have brought to your notice now?—I think not. From what you tell me was done in 1850 it appears that they then determined to have a token silver coinage circulating alongside of their full value gold and silver.

19,466. And that is unnecessary in a proper bi-metallic system?—I should have thought it was unnecessary, but still it would save money.

19,467. Still, the United States so far departed from a proper bi-metallic system in order to be sure that while they had gold for the principal money they had a sufficient amount of silver for the token money?—I do not think there is anything at all inconsistent with a proper bi-metallic system, and free coinage of gold and silver, and gold and silver equally legal tender, and to run alongside of that a token coinage like we run our token silver and our token copper. You get a little profit out of it, you see.

19,468. Is not the effect of that to destroy altogether that alternation between gold and silver which is one of the objects of the bi-metallic system, as I understand?—Not while you keep the gold and the silver, which are not token money, equally full legal tender.

19,469. Would that not be the effect all the same. The country which wanted it, when it had a sufficient quantity of token money in daily use, would not want any more?—They would not want it for use, to handle it as subsidiary coin, but the bankers would be able to hold either the one or the other just as suited their convenience or as came to them from the mints or in the course of trade.

19,470. Then with regard to this question of the Act of 1873 being passed through inadvertence, have you read the explanations of Senator Sherman who had charge of the Act of 1873, as well as of more recent Acts on the subject?—Yes. I have.

19,471. He denies altogether that there was any inadvertence?—Yes, he does.

Mr. E. L. Everett, M.P.
4 May 1894.

19,472. And he gives explanations of the number of drafts through which the Act had to pass, and other explanations of that kind, which show that to anybody who took an interest in it it could not have been passed through inadvertence?—It evidently was passed without many of those who now see the importance which was contained in it, having the least idea of what was being done even if they had knowledge of it.

19,473. Still, that is a slightly different thing?—Yes.

19,474. It is quite possible, for instance, that some attention may have been given to the questions of price before the Commission of 1879, and yet Mr. Chaplin admits that he knew nothing about it at the time?—Yes; that is a very common state of affairs, in regard to monetary changes I am afraid.

19,475. So that it is not strictly correct to say that the Act of 1873 was passed through inadvertence?—I must think that the radical change which was made was not explained to the Houses of Parliament there, and that the country generally had no idea that a radical change was being made.

19,476. Have you referred to the letter of Mr. Hendricks in the "Economist" which I mentioned when I was under examination, myself?—No, I have not.

19,477. That showed that the change was fully understood on this side of the Atlantic at least, and fully explained?—I should like very much to look at it.

19,478. That is surely evidence that the thing was not done in a corner at all?—Yes. But Americans still contend that they were quite ignorant of what was being done.

19,479. Then with reference to the state of matters in the United States. Was there not some evidence of gold being in a special position in the fact that all through the Civil War many of the bonds which were issued by the United States Government were expressed to be payable, as far as the interest was concerned, in gold and not in silver?—I expect that would be in reference to the fact that gold is the standard in England, and that they thought they would more readily get the money lent from England if payment was assured in gold.

19,480. Whatever the idea was the bonds were issued with the interest payable in gold?—Expressly in gold?

19,481. The question arose, I believe, with regard to the principal, which was not expressed to be payable in gold, but the Secretary of the Treasury for some years after the war wrote letters expressly engaging the Government to pay the principal as well in gold?—Indeed!

19,482. Was it not also the case that in order to pay the interest on these bonds the United States Government enacted that the Customs duties were to be payable in gold?—Yes, I think I have read that that is so.

19,483. So that before the Civil War and all through the time of inconvertible paper side by side with the paper you had certain transactions of the Government carried on in gold?—Yes, the money which they had to pay to England could only be in the shape of gold, and, therefore, in order to make sure that they had gold enough to discharge such obligations they insisted on receiving gold at the Customs, I suppose.

19,484. So that, as a matter of fact, although the United States was a country of inconvertible paper, yet they had gold placed in a special position?—Yes, and though it was under a bi-metallic law.

Nature of demand for gold in United States

19,485. It was not left on a purely bimetallic basis, as the assumption is of those who refer to the Act of 1873 as being passed by inadvertence. Then, I think, we had some conversation about the nature of the demand for gold in the United States, and you made the remark that to some extent it was due to the contraction of the paper currency, and that the silver to some extent relieved the pressure upon gold which would have arisen from the contraction of the paper currency?—Yes, I am sure I have read so in the last year or two.

19,486. The contraction of the paper currency, I believe, was a contraction of the national bank notes?—I know they have several forms of paper money in the United States of America, but I am not able to follow the different kinds.

19,487. Would it not be more correct to say that the issue of paper against silver in the United States was a means of redressing the mischievous law by which the paper itself in other forms was contracted, and that there was no real relief to gold by the issue of that paper against silver—that it only relieved a special difficulty of their own manufacture, as it were?—Yes, I daresay that that was so.

19,488. The point I wish to make is that the contraction of gold in the United States might have been avoided to some extent by a different management of the paper issues quite apart from those issues of paper against silver?—Yes, I should think that is quite likely.

19,489. If you had not contracted the issue of bank notes to begin with, you would not have needed that issue of paper against silver, of which so much has been made?—They created a leakage by their system of contracting the notes, I suppose.

19,490. I think these are all the questions I have to ask you about the different eras. I would like now to ask one or two more miscellaneous questions. First of all with reference to that Act of 1816 in this country, which you refer to as being nominally an Act for the establishment of a new silver coinage, I think?—Yes.

Suspension of coinage of silver in England.

19,491. Yet under that Act the single gold standard was established in England. I put to you the question whether as a matter of fact the coinage of silver in England had not been suspended from 1798?—I was quite unaware that it had been suspended by law, but you have shown to me a law of that date which did, as a matter of fact, I see, suspend the right of the subject to get the silver coined.

19,492. I referred to an Act of the 21st June 1798, the first section of which re-enacts that law which you spoke of, limiting the legal tender of silver?—By tale to 25*l.*

19,493. Yes, by tale, and so on. The second section absolutely suspends the coinage of silver, being to this effect: "And whereas His Majesty has appointed a "Committee of his Privy Council to take into con- "sideration the state of the coins of this Kingdom, "and the perfect establishment and constitution of "His Majesty's Mint, and inconvenience may arise "from any coinage of silver until such regulations "may be framed as shall appear necessary: And "whereas from the present low price of silver bullion "owing to temporary circumstances, a small quantity "of silver bullion has been brought to the mint to be "coined, and there is reason to suppose that a still "further quantity may be brought, and it is therefore "necessary to suspend the minting of silver for the "present; be it therefore enacted that from and after "the passing of this Act, no silver bullion shall be "coined at the mint, nor shall any silver coin that may "have been coined there be delivered, any law to the "contrary in any wise notwithstanding"?—You will notice by the terms of it that it is distinctly a temporary Act to provide, as it expresses it, for temporary and passing circumstances.

19,494. By an Act of the 12th July 1799, this temporary Act was continued and made perpetual?—Made perpetual, or continued for another definite period?

19,495. It was made perpetual. This is the note that I have in this volume of the statutes at large:—"That "the Act was again revived and made perpetual"?—Dear me! then the position of England in regard to money was this:—our legal tender money was inconvertible paper, and the power to coin silver was taken away; but the right to coin gold, I suppose remained still.

19,496. That remained, I suppose; but still the actual suspension of the coinage of silver did not take place in 1816, as you would have inferred from what you said; it had taken place in 1798, and from that time England must have ceased to be bi-metallic in any proper sense of the word?—The old Act of Charles II. still remained, but these two Acts suspended its operation—in fact they made it a dead letter.

19,497. In fact, the measure was a measure of exactly the kind which happened in France in 1874, when the free coinage of silver was put an end to?—But how came the Act of Charles II. to still live on, which I understand it did, until Mr. Lowe altered it in 1870?

19,498. That is perhaps an affair of the draftsman. I believe this particular Act of 1799 was not repealed until 1871?—The Act of 1816 for the new silver coinage

Mr. R. L. Everett, M.P.

4 May 1894.

gave power to the Government to reduce the silver in the coin; they were to coin more shillings out of a pound of silver. It also gave them power as to silver to keep the Mint in their own hands unless a Royal Proclamation was issued, and if a Royal Proclamation was issued then the clause of the Act of Charles II. immediately revived again, as I understand the law.

19,499. Would you admit, then, that the bi-metallic tie was put an end to in 1798 in England?—It looks to be so under that legislation; but the first of the two Acts was distinctly a temporary Act.

Act of 1816 introducing silver token money.

19,500. Then with regard to the Act of 1816 itself being passed as it were by inadvertence, or silently, I suppose you would not go quite so far as to say that?—Oh, dear, no. I have read Wellesley Pole's speech in introducing it, and the few short speeches that were made besides his. The intention was quite clear and distinct, and the knowledge of what they were doing was quite distinct. They were really carrying out what, in his letter to the King on the coins of the realm, the old Lord Liverpool had expressed as, in his belief, the ideal system for England.

19,501. It was really carrying out a very deliberate policy?—Yes, or a policy recommended by this old man, who had been a very great authority.

19,502. Would you agree with what Mr. Wellesley Pole stated in that debate in a passage which I am going to read to you with reference to the state of opinion at the time about a double standard, to this effect:—"When the Committee took into their consideration this short view of the history of our circulation he believed he should be anticipated in his opinion that it could not be expedient to allow the coins of both the precious metals to be equally legal tender and standard money of the country to an unlimited extent. It had been the opinion of, he believed, all the eminent men who had written upon the subject that there should be but one standard measure of value. Sir William Petty, Mr. Locke and Mr. Harris upon this point had all concurred. Mr. Locke says that money as the measure of commerce ought to be kept as steadily and invariably as may be; but this cannot be if your money be made of two metals, whose proportion, and consequently whose price, constantly varies in respect to one another. Sir William Petts declares there can be but one of the two precious metals of gold and silver fit to be a matter of money. Mr. Harris observes that only one of these metals can be the money or standard measure of commerce in any country. In later times, after a further experience of the evils arising from the collision of two standards from the competition raised between the coins of the two precious metals, these opinions had been strengthened by the writings of Mr. Alcome and Dr. Adam Smith, the late Lord Liverpool, and lastly by the Report of the Bullion Committee. All these authorities had agreed that the standard measure of value—the standard coin of the realm—should be composed only of one of the precious metals. He believed, therefore, that it would be universally admitted that there should be but one standard coin of the realm to be at once the measure and equivalent of property." You admit, I suppose, that that was a correct statement of opinion at the time?—Yes, but when you use that as opposed to the bi-metallism which we ask for to-day you incorrectly represent the state of things in the past. At the time all these great men who have been quoted were writing the two metals were in use side by side, with full legal qualities at a ratio which was varied from time to time by the Government. One of them only was the standard, but the other was rated to it and was full legal tender, and was allowed unlimited right of coinage, so that it was bi-metallism to all intents and purposes, though you kept still silver as your standard, but you interposed no limit or check whatever upon the free coinage and use of gold.

19,503. But still the Act of 1816, which introduced token money of silver ---?—Yes.

19,504. Was intended to carry out the theoretical opinions which had come to prevail, that you could only have one standard money?—Yes, but those opinions, you see, were expressed at a time when the invariable practice was to allow free coinage and full legal tender to both.

19,505. Still the Act of 1816, itself was understood to be a carrying out of the theoretical opinion which had come to be formed, and it was passed unanimously at that time?—Yes, it was passed without opposition except in the House of Lords, where I think you will find some lord, I forget his name, made a written protest, which you will see in Hansard, giving a series of reasons why he thought that this legislation was mistaken, and amongst the reasons was this: that there might in time to come arise a difference in value between gold and silver, and that great inconvenience might then arise from this new departure. The words are almost prophetic.

Mr. R. L. Everett, M.P.

4 May 1894.

Rates between gold and silver.

19,506. And the opinion of that time was that Government would not be successful in making a fixed ratio between gold and silver?—Yes. I think that the science of money, like most other sciences, is a progressive one, and that we have learned in these last 20 years a good deal that was altogether unknown to those who went before us.

19,507. Still I suppose you would admit that people like Locke had studied the subject a good deal, and with reference to the experience of a time in which gold and silver in bi-metallic countries did not preserve the ratios which were established by the Governments?—You see there was not the same rapid interchange between the different nations then that there is now, but when different nations had different ratios they could not all work together. That was the reason that sometimes our silver went away from us and sometimes our gold, because some other powerful nation had a different ratio, and the dealers in gold and silver found it to their profit to steal away one of our kinds of coins and sell it where it passed at a better ratio.

19,508. Still the universal opinion of that time was that you could not preserve a ratio?—Yes, or only by making changes in Mint laws from time to time.

19,509. Was that opinion admitted in the debate in 1893 upon the French Bi-metallic Law itself—have you read that debate?—I have not read that debate.

19,510. You are not aware that it was admitted in that debate that it was hopeless to preserve a ratio?—Dear me! No. Facts have provided the reverse.

19,511. That the authority of Locke and Newton in the matter was admitted to be indisputable, and that that law was not passed with any expectation that the ratio would be permanently preserved?—Really that is a remarkable thing.

19,512. I believe that it is stated by M. Wolowski in his book "L'Or et l'Argent" that in the original draft of the law there was an express provision for the re-coinage of one metal or the other when it should become necessary by a change of the ratio, and the clause provided that the metal to be re-coined in France on such a change occurring should be gold, but that clause was omitted in the subsequent drafts of the Act, although it was in the original draft?—Indeed!

19,513. This shows that the state of mind in those early years was entirely founded upon the belief that a ratio between the two metals might be made by law, but that the market might change it, and then the law would have to follow the market?—I should say that the wider experience of the last 70 or 80 years shows us that a ratio can be preserved by law if it prevails over a considerable group of nations.

19,514. Then who were the great men who made the discovery?—We who have lived since 1873 are the people who have been able to discern that, because we see now utter confusion introduced where there used to be comparative order.

19,515 You cannot give me the names of the discoverers and expounders of this wonderful discovery?—This worthy man who had his death warrant with him—M. Cernuschi—was one of the first to discern what it was that was the matter with us now—why gold and silver vary so much more in these last few years than they had done in the centuries in the past.

19,516. I am asking this question partly because I was informed a long time ago by Sir Louis Malet, Mr. Grenfell, and others, that one of the authorities to whom I should refer was Sismondi, a well-known economist who wrote in the 1820's. I referred to the passage, and when I came to criticise it in one of my papers I did not think very much of it, and Mr. Nicholson turned round upon me and said that Sismondi was no authority. So I am asking the question to get some information?—The extraordinary divergence that has grown up between the two metals since 1873 has opened the eyes of hundreds and thousands of people to ask whether there has not been some new cause, or rather

Mr. R. L. Everett, M.P.

4 May 1894.

whether there had not been something in operation prior to 1873 which was removed then and led to the violent fluctuations.

19,517. I believe that Mr. Foxwell will probably refer me to an older authority still; but what I am puzzled by is that in no authority to whom I have been referred can I find any exposition of the theory, or any refutation or even any knowledge of the great authorities on English money who preceded them?—I cannot help thinking this, in previous times people in every nation considered that the more gold and the more silver they could get the better; they regarded them both as good gifts of Heaven to be received with gratitude, and it never entered into their heads that the time would arise when some civilised nation would desire to proscribe the use of one of those two—they never imagined such a thing was possible.

19,518. The object of the Act of 1816 was not to proscribe the use of one of the metals. Would not Lord Liverpool have said that he was providing for the fullest use of silver that could properly be made of it. Lord Liverpool did not intend that the Mint should be closed to the public against silver, unless it was found that silver at the new ratio was going to drive the gold out of the country. There was no intention to proscribe silver; power to do it was given purely as a matter of safety in case gold showed signs of being driven away?—Their object was to keep both metals in the country.

19,519. Then you cannot give us any idea further than you have told us of the discovery that gold and silver can be kept at a fixed ratio?—I think we have learnt that by departing from the old practice and finding the extraordinary increase in the variations between the two metals under the new practice as compared with the old.

19,520. Was it not the case that Locke and those people, when they were considering the matter, had had before them a time of very considerable change between gold and silver?—Yes.

19,521. When every country had a fixed ratio?—Only the different countries had different ratios, and changed them from time to time.

19,522. Still they had ratios?—Yes.

19,523. And yet it was found that the metals changed between themselves, and that each country had to go on changing in order to keep the gold and silver that each required?—Yes, that was so.

19,524. But have the permanent conditions of the world changed in that respect?—The world is practically all one country now, and was not then.

19,525. If each country wishes to have a certain amount of gold and silver it will probably take the measures to get the gold and silver that it requires?—Yes; and with the fuller knowledge that we have, as the result of experience, especially of the experience of the last 20 years, we can see, I think, that if a considerable group of nations hit upon a suitable ratio and keep to it, there is a fair probability that the two metals will circulate side by side.

19,526. Would each nation get the gold and silver it required?—Yes.

19,527. At the ratio?—Yes.

19,528. Has that point been much considered; is not a difference of ratio between nations absolutely necessary to enable each of them to get the gold and silver it requires?—No, I think not.

19,529. Is it not absolutely necessary that India should have a different market ratio for gold and silver than Mexico has, because Mexico is a producer of silver and a purchaser of gold, and India is a purchaser of both gold and silver?—I suppose while the mints of France and the United States kept open, silver and gold all over the world conformed within a very little to the ratio there in use.

19,530. Is it not the case that the ratio of silver to gold in India was always more favourable to silver than in any other part of the world?—I do not know.

19,531. Except in outlying parts which I do not know about, but it was usually, as a rule, much more favourable to silver than the ratio in France, for instance, otherwise the flow of silver from France to India and from England to India would not have gone on?—If you want to carry one particular metal from countries that have it you must pay the cost of getting it there; you must give an inducement to get it there. I, of course, see that.

Mr. R. L. Everett, M.P.

4 May 1894.

19,532. Is that not the permanent condition of things?—Yes, I think it would be.

19,533. Certain countries produce silver and wish to dispose of it, and other countries wish to obtain silver?—Yes.

19,534. And the countries that wish to obtain it must offer a better price than is obtainable for it in the countries which produce it?—Yes, it is likely to be so.

19,535. Therefore, in order to have a proper distribution of the precious metals it is absolutely necessary that you should have a different ratio in different countries, and an international agreement for a common ratio is an impossibility?—You had a common ratio, as I understand it, in existence from 1803 to 1873.

19,536. You had one ratio in France, but that was not the ratio in India?—India you see was only a silver country.

19,537. But there was a market price?—If you wanted one particular metal there, and had to get it from another country, you would have to pay the cost of carriage to take it there.

19,538. But is it not the case that countries have different wishes and desires in the matter, and if they wish to have a thing they will pay the price for it?—Yes.

19,539. Therefore, if all the Governments agree upon a common ratio, then the ratio that is to effect the distribution of the precious metals themselves will always be different from the Government ratio?—You would always have to pay something as the cost of carrying the metal: if you insisted upon one particular one.

19,540. That is to say, you would have a different price?—Yes, but it would only vary from the mint ratio I think by the cost of carriage to wherever you wanted to take that particular metal.

19,541. How do you know what price India would have to pay for the silver she required?—For legal tender purposes the two metals would have the same value and be the same money.

19,542. Is it not the case that in India itself you have different ratios in different parts of the country between gold and silver?—I do not know, I should not have thought that it was, but it may be so.

10,543. That is quite in accordance with what we know about money in other parts of the world?—In a backward country I daresay.

10,544. Is there not such a thing as a premium upon gold in different parts of the country within our own country or rather a premium upon gold sent to London?—Yes, I suppose there arise circumstances of that kind when you have to pay the cost of the carriage or a trifle besides for the convenience of getting one particular metal, but nobody heard anything about exchange difficulties, and difficulties of ratio, during the 70 years in which the French ratio was in existence.

19,545. Are these not difficulties that were familiar to people who had to deal with the subject in this country 200 years ago; they were face to face with the practical question, were they not?—Yes.

19,546. And that is not the case with any of the authorities of late years who have told us so much about money, so far as I know?—Of course we are face to face with one of the most practical and serious dangers that have ever arisen in the history of money.

19,547. At any rate to take Sismondi for instance as an authority upon the theory of bi-metallism, he discusses none of these things which Locke and the others discussed long ago?—Indeed, I will try and look at his book.

19,548. I wish to know if you can refer me to any authority who does discuss it?—No, I do not think that the question in its present phase had ever engaged the attention of mankind.

19,549. Surely when a new thing of this kind turns up, what you ought to do is to go back to the former experience when people had to deal with the subject practically and see what the difficulties really were. But you cannot throw any further light upon the question?—No, I cannot. The question which faces us is altogether new.

Mr. R. L. Everett, M.P.

4 May 1894.

19,550. It seems to me there are two questions as to the effect of this bi-metallic ratio. one is that an alleged effect of the ratio being established by law is to keep gold and silver steady with reference to each other?—Yes.

19,551. And the other is that the resulting level of prices is steadier when they are united than when they are not?—Yes, that is a just expression of our opinion.

19,552. Upon your last expression I have already put to you several questions, and I do not propose to continue them; but with reference to the first, how long do you say the bi-metallic tie existed after 1803?—For 70 years I have understood—till 1873.

Duration of bi-metallic tie in United States and France.

19,553. But that was not the case I think you have admitted as far as the United States is concerned?—The United States Mint was open to the two metals, though when they were under the inconvertible paper money I suppose probably they had very little to do, and you have shown us that by their law in 1850 they provided for a token money.

19,554. But the issue of the inconvertible paper was a suspension practically of the bi-metallic tie between the two metals themselves as far as the United States was concerned—there was no free mintage in fact, although there was a law for that purpose?—Yes, but I think the existence of that law would have prevented such a divergence of the previous metals or anything like such a divergence as has occurred. This that has now occurred would not have occurred if they had not altered their mint law.

19,555. In 1873?—Yes, or somewhere about that date.

19,556. But between 1860 and 1879, when cash payments were resumed, the United States was practically a country outside the working of the bi-metallic law?—Yes.

19,557. Then in France, when did the same bi-metallic tie come to an end?—As I understand it the French are still bi-metallic; both metals circulate at the old ratio; the coins of both metals are full legal tender, and I do not think they have altered their mint law, but have suspended it.

19,558. France at a certain date became also a country of inconvertible paper?—Yes, for a short period.

19,559. I think you referred to a speech of Lord Beaconsfield in 1873 in which he spoke of France as being at that time a country of inconvertible paper?—Yes, he did.

19,560. The issue of inconvertible paper commenced during the war of 1870?—Yes, I imagine so.

19,561. From 1870 onwards, France, like the United States, was a country outside the working of the bi-metallic law?—Yes, it was in suspension in that country.

19,562. For the moment, then, in the United States from 1860 to 1879, the working of the monetary arrangements was outside the bi-metallic law, and in France from 1870 onwards the working of the monetary arrangements was also outside the bi-metallic law. What I wish to know is what effect the bi-metallic law had in maintaining the ratio in those years when it was in suspense everywhere?—All the coins that had been struck under that law were still in circulation and were still legal tender at their old rate.

19,563. Is that true of the United States?—It was until 1873.

19,564. Were the coins in circulation?—Yes, except where they had these token coins which might just as well have been bits of paper, or bits of copper, or bits of iron.

19,565. Was there anything in circulation in the United States from 1860 down to about 1879 except paper?—I do not know. I daresay most of their coin went away during that period of paper money.

19,566. With the exception, I believe, of the States in the Far West—California and one or two others—where they insisted upon retaining gold, there was practically nothing in the United States except paper?—Really; it had all come away to Europe and other countries.

16,567. It had all gone away or had been hoarded—of course it is quite impossible to say which?—Of course that was one of the influences then which helped to raise prices here.

19,568. I think you told us generally that the effect of the issue of inconvertible paper is to supersede and displace the metals which it is supposed to represent? Yes, so I read history.

Mr. R. L. Everett, M.P.

4 May 1894.

19,569. As a matter of fact, comparatively little gold or silver was circulating in France at the time they had inconvertible paper—it would be so?—I fancy they had enormous stocks still in France; what it was doing I do not know.

19,570. Still, is it not the case that as a matter of fact immediately after 1870 you had issues of small notes, much smaller than had existed for some time before—the scarcity of actual coin was so great?—I suppose people in a time of war who have got coin hide it.

19,571. Still, is it not the case that the working of the bi-metallic law which consists in free access of the different metals to the mints was practically in suspense?—Yes, it was in suspense, I think.

19,572. Then the steadiness of the ratio whilst the bi-metallic law was in suspense was not owing to the bi-metallic law?—Yes. Of course all the existing coins were still legal tender at the ratio at which they had been struck, and people would not think anything about it, but what they would expect would be that as soon as cash payments were returned to the mints would again work just as they had worked before.

19,573. Did that operate in any man's mind, do you think, in the United States?—I do not suppose people thought about it.

19,574. Was it much thought of amongst the people who were commonly using paper in France?—No, I do not suppose it was.

19,575. Then, as a matter of fact, if the ratio was steady in those years that I have mentioned it was not owing to the bi-metallic law?—It was a product of the bi-metallic law, I think.

19,576. You can give us no further information about the remedy which you propose except that you would like to see a ratio as near 15½ to 1 as you can get?—I am not at all wedded to a ratio, but I have personally formed a general opinion that looking at the enormous mass of coin that already circulates at that ratio, and at the fact that in all probability that would have been the prevailing ratio still but for these legislative changes, it would be wiser to revert to that than to start upon a new one.

Ratio between gold and silver.

19,577. And you would face all the disturbance that some people would expect in order to obtain that remedy?—My personal judgment is that way.

19,578. (*Mr. Chaplin.*) When you mentioned that you yourself were individually inclined towards the adoption of the old ratio, that does not mean, I suppose, that you state that as representing the views of what are called the bi-metallic party?—Oh, dear no. I have heard continually among the leading men in that party that in their opinion any ratio is better than none, and that they think the ratio fixed upon must pre-eminently be a matter for mutual consultation among the nations.

19,579. (*Mr. Giffen.*) Not "any" ratio in the absolute sense?—The ratio of to-day they would greatly prefer to no ratio.

19,580. But you do not mean literally "any" ratio?—No.

19,581. (*Mr. Chaplin.*) By that Mr. Giffen means, I assume, that you do not mean a ratio lower than the present one?—No; not lower than what was prevailing when the change was made.

19,582. The great object, I understand, of the advocates of bi-metallism is this, that there should be a stability in the ratio between gold and silver?—That is the object.

19,583. And that they would take any ratio between the present ratio and the old ratio that would bring about that effect rather than have none?—Most decidedly; that is the universal opinion I have heard among bi-metallists.

19,584. You were asked by Mr. Giffen at the early part of your examination whether what is known as the quantity theory had ever been exactly formulated; it is the case, I think, that it has been sufficiently formulated to enable economists to pronounce a very distinct opinion upon it?—Yes, they are all of one opinion, so far as I know.

"The quantity theory."

19,585. Can you name an economist of repute who disputes in the present day what is known as the

Mr. R. L. Everett, M.P.

4 May 1894.

quantity theory?—No, I cannot. I do not think there is such an one.

Effect of Sherman Act in the United States.

19,586. You were asked by Mr. Giffen whether it was not the fact that the Sherman Act in America, accompanied by proposals for the free coinage of silver in the United States, did not cause a great monetary disturbance; it is the case, I think, that the Sherman Act could in no sense be described accurately as bi-metallism?—Oh! dear, no.

19,587. In fact it was opposed to all bi-metallic theory?—Yes, the leading bi-metallists of Europe were very sorry to see it adopted.

19,588. Is it not the fact, in your opinion, that the great monetary disturbances in America were caused rather by the effects of the Sherman Act than by the proposals for the free coinage of silver?—My own opinion is that those disturbances were caused more by the writings of the gold party in the press here and in America than by the actual effects of the Sherman Act itself.

19,589. But as a matter of fact the two things, viz., the Sherman Act and the proposals for free coinage, are entirely different and distinct?—Entirely different.

19,590. I think it is the case that the adoption of the Sherman Act was disapproved of at the time, generally speaking, by the advocates of bi-metallism, and that they foretold its failure?—Yes, and were afraid that its failure would prejudice the cause which it was only a caricature of.

Effect of adoption of bi-metallism.

19,591. You were reminded of a statement made in 1880 by prominent statesmen in England to this effect, that you must not speak of bi-metallism because it would produce a panic; and it was also suggested to you by Mr. Giffen that the adoption or the threatened adoption of bi-metallism in these days would probably be followed by a panic now; is it not the fact that the leading nations in Europe in conjunction with the United States, or without the United States, could adopt bi-metallism at any moment now?—Undoubtedly.

19,592. And if they did so the effect of its adoption would be precisely the same as if England had been a party to it?—Yes, judging from the experience of the past, that is so.

19,593. Then if all these dreadful consequences which have been foreshadowed by Mr. Giffen as the consequences of bi-metallism are to be held as true, a panic may be created at any moment now by the adoption of bi-metallism by foreign nations over which we should have no control whatever?—Yes, certainly; we do not preserve ourselves from that danger by holding aloof.

19,594. It was also suggested to you that under the circumstances referred to 600 millions of money which are out at call would at once be called in, because those who called it in would wish to have their gold back in their possession before it depreciated. What use would that be to them; what could they do with it even if it was possible to suppose that they could get it?—I am quite unable to see that they would get any advantage.

19,595. I suppose they might hoard it?—They could hoard it.

19,596. In that case they would lose their interest upon it?—Certainly.

19,597. I suppose they might invest it in commodities or in silver before prices began to rise?—Yes.

19,598. In that case would not their action immediately bring about the very rise in prices, the effect of which would have been their object to escape by calling in their money?—It would certainly look to do so, if all that money were called in and immediately invested in the purchase of commodities.

19,599. I speak from recollection, and I do not know whether you can assist me under such circumstances, but the idea of this panic was first suggested many years ago by Mr. Herries, I think?—So I have heard. Mr. Gladstone alluded to this in his speech in February last year, I think it was.

19,600. It was afterwards suggested by Mr. Giffen in his book upon bi-metallism?—Yes.

19,601. Then while admitting that every precaution should always be adopted against anything which would be likely to result in the creation of a panic, in dealing with questions of finance, do you regard the suggestion of Mr. Giffen this afternoon that the adoption of bi-metallism would result in the calling in of 600 millions sterling as in any way a serious contingency?—No, I confess I do not. I think that we shall have to face far graver and more substantial perils by avoiding the earliest consideration of the subject than that would form.

Mr. R. L. Everett, M.P.

4 May 1894.

Effect of bi-metallism on debtors.

19,602. You were asked as to what the view of the bi-metallists was in the adoption of bi metallism with regard to debtors; what would be its effect upon debtors; is it not the object of bi-metallists in the first instance to arrest the present fall in prices?—That is so, and to secure the most stable standard of value which is within our reach.

19,603. Perfect stability in the standard, I believe, is universally admitted to be impossible?—Absolute stability, yes—there can only be comparative stability.

19,604. I take it to be your view that if the standard is to vary at all it is better that it should vary in favour of the debtor rather than in favour of the creditor?—Yes, I do not think any fact is more clearly written on the page of history than that times of appreciating money are times of depression and industrial trouble, and times of depreciating money are times of great industrial activity. I think all the economists are unaminous and emphatic in agreement upon that point.

19,605. Would you advance as one reason for your conviction upon this point that the debtors are infinitely more numerous in the world than the creditors?—Yes, and are the producing classes.

19,606. And are also the producing classes?—Yes.

19,607. And it is the fact, I think, that bi-metallists complain, and, in your opinion, complain with justice, that they are suffering at this moment from the very evils which Mr. Giffen anticipates will fall upon the creditors if the law was changed, and which evils have been brought about artificially by changes in monetary legislation?—I feel very strongly that the debtors of the present day, whose debts date back 20 years ago, have been the victims of one of the most cruel moral wrongs ever inflicted upon innocent people. I would not accuse those who have brought it about of having done it intentionally, but in its effects it has been one of the cruelest crimes, if you might call it a crime, ever committed in the history of mankind, I think.

19,608. You were asked just now, putting aside altogether the question of what had occurred in the past, whether fresh debts were not being created every day, and whether the creditors in these cases would not equally be affected; is not the answer to that this—that the appreciation of the standard is still going on every day?—Yes, the creditor is every day seeing an advantage given to himself in the bargain he has entered into.

19,609. So that in every fresh debt which is incurred from day to day the debtor continues to be placed in a position of great disadvantage by the fact of a continued appreciation of the standard?—Yes, and the creditor would receive something which he never contracted for.

19,610. I suppose you agree in the view which is constantly stated, that it is the right of every State to improve and to make the most perfect standard that it can for the use of the community?—I think it is one of the highest functions of the State; one of the most important functions of the State.

19,611. But it is unfortunately the fact that no change can be made in the standard of value without affecting some interests of some persons?—Injuriously, I am afraid that is so; that certainly is so.

19,612. If there is to be a change at all then your view, I take it, would be this, that it is better that the standard should depreciate rather than the opposite?—Most decidedly.

19,613. In other words, that if changes are inevitable those changes it is desirable should be rather in the interest of the debtor than in the interest of the creditor?—I quite think so, and I think also that whether the standard shall appreciate or depreciate should, as far as possible, be put out of the reach of human manipulation. I would much rather have a standard founded upon the gold and silver that the Almighty has provided for us in the earth, and which time keeps bringing to light, than have the standard manipulated one way or the other by human legislation. I would rather have it based on a natural foundation like the foundation of the two precious metals than upon an artificial legislative foundation.

Mr. R. L. Everett, M.P.
4 May 1894.

19,614. Your view is this, that all the gold and all the silver that the world can produce should be made available for this purpose, and in consequence that we should have an automatic issue to be added to the volume of the money in the world, rather than an issue which depends upon the fiat of governments?—Yes, I think it is infinitely the most to be desired that it should be an automatic supply resting upon natural foundations, and then as the variations occur people would feel that they were not done by man's law, and must be submitted to as rather acts of Providence than as acts of men.

Effect of appreciation of gold on prices.

19,615. (*Mr. Dalton.*) I think you say that the times of appreciation of gold are always times of depression of productive industry?—Yes, that is so, I think.

19,616. According to this chart, were not the years from 1873 to 1879 a period of very great appreciation of gold?—Yes.

19,617. There was a great fall in prices then?—Yes.

19,618. The greatest fall I think shown on the chart, or very nearly so?—Yes, gold was appreciating rapidly then.

19,619. Was not that a time of very great prosperity for agriculture; were not the agricultural interests better off at 1879 than at any other time?—Yes, they were doing very well from 1873 to 1879.

19,620. How do you account for that?—A change in the supply or demand of the precious metals does not immediately take effect, and it had not taken operative effect I think at that time. For instance, the great gold discoveries began in 1847 in California, and in 1849 in Australia, but agriculture did not reap any benefit appreciably from that until about 1852 or 1853.

19,621. But there was a great fall in prices all that time; were they exceptionally good years for agriculture, good seasons, or what was the cause of it?—There was one very bad season, in 1875 I think it was; generally that was a bad season in the country; Mr. Read told us that they had not had a good all round season in Norfolk since 1874, did he not, but I did not agree with Mr. Read judging from my experience in Suffolk.

Mr. R. L. Everett, M.P.
4 May 1894.

19,622. Rents were rising all through those six years?—Yes.

19,623. And they reached their climax in 1879?—Yes; as I have said again and again the after-effects follow some time after the actual cause which set them in motion has ceased.

19,624. If we had bi-metallism should we get an immediate benefit or should we have to wait for seven or eight years?—I think there would be an immediate lift in things. When the going to free silver was confidently expected in the United States it was wonderful how immediately industry seemed to lift up its head though it did not last long.

Effect of agricultural depression on labourers and pauperism.

19,625. Has the effect of agricultural depression in your district been to throw any labourers out of employment?—Yes, a great many in the heavy land districts especially.

19,626. Has it at all increased pauperism?—I do not think it has. The extraordinary cheapness of food is such that only a day or two's work in a week will enable a man to keep off the rates.

19,627. If prices were to rise do you think it would be a good thing or a bad thing for the labourer immediately?—I think probably he would be rather injured for a year or two. I think that is quite likely; but there would be a much greater demand for labour and he would soon claim his fair share of the new conditions.

Adjourned till Thursday next at 12 o'clock.

Thirty-sixth Day.

Thursday, 10th May 1894.

PRESENT:

VISCOUNT COBHAM IN THE CHAIR.

The Right Hon. BARON RENDEL.
Sir ROBERT NIGEL FITZHARDINGE KINGSCOTE, K.C.B.
ROBERT GIFFEN, Esq., C.B.
Captain OWEN THOMAS.
FRANCIS ALLSTON CHANNING, Esq., M.P.
JOHN CLAY, Esq.
CORNELIUS NEALE DALTON, Esq., C.B.
ROBERT LACEY EVERETT, Esq., M.P.
JOHN GILMOUR, Esq.
GEORGE LAMBERT, Esq., M.P.
WILLIAM CUTLACK LITTLE, Esq.
CHARLES WHITEHEAD, Esq., F.L.S.

HERBERT LYON, Esq., *Secretary.*
R. F. CRAWFORD, Esq., *Assistant Secretary.*

Mr. CHARLES WILLIAM SMITH re-called and further examined.

(For previous evidence, *see* Question 15,572, p. 50.)

Mr. C. W. Smith.
10 May 1894.

19,628. (*Viscount Cobham.*) I believe you wish to call attention to certain points in the evidence you gave on April the 6th?—Yes, I have some small explanations to make on the cross-examination, and also I have noted a few more points, which I think are very strong evidence, which have arisen since I was in this room last, and with your permission I shall be very pleased to explain them, and then on any of the further points that I have brought forward, if you wish, you can cross-examine me as well as upon those that I have already given.

19,629. We will take the evidence already given first. Are there any points in the oral evidence that you gave the other day that you wish to correct now?—I have some fresh evidence beyond the evidence produced which has come to my knowledge since, and which I think are most interesting points for the Commission to know. There are various points on my cross-examination which I wish to explain, for the questions and answers as printed in the report are not quite clear to me. I think that a little further explanation would bring out all the points a little bit clearer.

Mr. C. W. Smith.
10 May 1894.

Sugar gambling.

19,630. Take those points in your own order please, but as shortly as you can give them?—At Question 15,584 Mr. Giffen asked, "Was there not a large amount "of gambling many years ago in Greenock in sugar"; I thought the question referred to prior to 1880 and not to the systems. I was not aware at that time that I was going to be cross-examined on anything but the systems, and therefore my answer to him was, "I do not know." If he will refer to the printed memorandum of evidence on the effect of the systems in the beet-root sugar market since 1880 he will find there that the systems since introduced have had exactly the same effect on the sugar market for the

Mr. C. W. Smith.
10 May 1894.

first few years that the systems have had upon every article of produce. I refer there to the great panic years 1884, 1885, and 1886, when the systems were introduced into this country largely in Glasgow (or as Mr. Giffen said Greenock, which is virtually the same), Liverpool and London. We had a great panic in sugar. If I remember right, beet-root sugar went down from something like 18*s.* to 10*s.* in a state of panic due entirely to collapse and failure in trade, and to panics on the Continent and in this country in the beet-root sugar future contracts. Considering that up to 1883 my firm was, I may say, I suppose, the largest sugar brokers in England, dealing largely both in cane sugar and beet-root sugar, I can speak with experience. In those two particular years when the panic took place—that is in 1884–85–86—I was credited with taking a leading part. I have acknowledged plainly that I have been, I may say, almost a pioneer of these systems, that is I saw exactly how everything would have to fall under them, and I have the credit I believe—I think it is pretty well acknowledged in the commercial world—of being the leader in this country of smashing that beet-root sugar market by bearing it. I was operating through three or four brokers very successfully for friends and others. Therefore, I can speak with some experience, I should like simply to explain from that point of view that I thought Mr. Giffen's question referred prior to that time and did not refer to the systems in 1880. The next Question

Cotton panic, 1878.

I wish to refer to is 15,592 which refers to the 1878 cotton panic. I forget which member of the Commission mentioned the 1878 cotton panic, but it is a most important thing to refer you to, because it was the first panic in this country which arose absolutely, solely, and only, directly the introduction of these systems took place in cotton. I refer to it very palpably in pages 52 to 56 of "Commercial Gambling," and if you will allow me to read it I should like to—it will not take one minute. I said, "In the year 1878, a "German Jew from America named Morris Ranger "tried to corner the Liverpool cotton market. I may "remark this was the first corner of any magnitude "ever attempted in this country. This gambler held "some 150,000 bales, futures sold to him as October "delivery, but based on no settlement system, as ex-"plained before"—or at any rate my evidence has fully explained that—"under the financial pressure "of the future contracts, cotton fell to the then "unheard of price of 4¾*d.*" In August 1878, cotton, if I remember right, was about 6¾*d.* We had the City of Glasgow Bank failure in 1878 which affected principally Glasgow, Liverpool, and Manchester, and we had a large number of swindles and prominent failures which you will remember connected with it such as Alexander Collie and Co., and Heugh Balfour, and many others. Cotton fell with this man holding 150,000 bales of future contracts out of a total stock of 200,000 bales of American cotton in Liverpool in December. We had a financial smash, and cotton, before the panic was over, fell to 4¾*d.* which was an absolutely unheard-of price. "It was estimated that Ranger's losses were about "400,000*l.*, which, however, largely fell upon his financial "supporters, who were principally the leading foreign "bankers established in Liverpool, London, and the "Continent. I may mention especially that the stock "of cotton in Liverpool was at this time very small"—it was, as I tell you, 200,000 bales in December at the culmination of the panic—"and the fall in the article "was entirely due to financial pressure on future con-"tracts, and not to over-supply, because when the "former was over, cotton rose again at once to a con-"siderably higher value"—it rose by the following May, six months afterwards, to 7*d.* a pound. That was the first panic in this country based on futures. Of course it is a long story to go into why it rose to 7*d.* a pound, but I am perfectly willing, as I have already stated in my evidence, to give you the names of all the people who were interested in that enormous operation; why they had to back him up, and so on. I can give you the cause of the rise; there were sound grounds for it. The bankers were interested to an enormous extent, and they had to take up this actual cotton in the Clearing House, and by that means when the panic was over, cotton rose to its normal price. It never ought to have gone down to such an extent, and would not have done so, if it had not been for these enormous operations in futures held by this one man; and the fall ruined hundreds.

19,631. I do not want you to go further into that than is necessary to illustrate your point?—Exactly. "This shows conclusively that the system of cornering "which commenced then (owing its origin to the future "contract) and which has been gradually introduced "into many other articles of produce, is not only a "curse to every trader, but also brings about the enor-"mous swing of the pendulum in the prices of commo-"dities from one extreme to another." At Question 15,593 I was asked, "Then this system was introduced "as an improvement upon the previous mode of "settling speculative business," and my answer is: "On account of that." That was the principal reason that I gave you—that it was on account of the panic in 1878. But I should like also to say that the contract itself was altered to protect principal and client as described by the laws of England. A contract had to be framed by which every man became his own principal, because we all know that a man cannot accept a commission from a client and be his own principal; that is to say, he cannot sell it himself unless that man himself buys it from somebody. So the contract had to be altered to get within the laws of England which provide for the protection of principal and client. The systems were also altered to meet the times owing to the enormous strides made in the speculative department. Those were the two further reasons why those contracts were altered, and business is now done, as I explained to you, on the basis of these altered contracts, which have gone first into one trade and then into another since. The contracts are almost all worded the same. I should like to quote the legal decisions on this class of business in America and England. It was only in December last, after a great many cases had been tried in America, that the Supreme Court of America with all the judges present, decided that a man who gambles with no intention of delivering or of having delivery tendered to him is dealing in a gambling contract, and that that contract is null and void, and that no man need pay any differences whatsoever on that contract. As far as England is concerned, in "Commercial Gambling" I dwelt upon the cases which had arisen up to the time of writing that book, showing plainly that the law of England does not recognise operations in differences on the Stock Exchange or Produce Exchange as gambling. Under the new Gaming Act of 1892, the charge of gambling in these operations does not hold water. Since I wrote that book, I have no doubt that I have seen in the papers I should think from 12 to 20 cases tried in London and different places on that very point, raising the question, (whether it is gambling in the prices of commodities and in differences only or whether the question of principal and client comes in), whether the contract holds good or not. I have seen the question of principal and client decided in several cases in the law courts of England lately. Some of the contracts do hold good under the Act of 1892, especially where the question of principal and client comes in; but there are several cases, or at least there are two or three cases I know of, which are going to be tried exactly on this basis, that is to say, if you operate through me and you lose a lot of money through these systems, in case you can prove that the differences are simply on paper and in differences alone, whether I can claim upon you for those differences in the case of your making a loss.

Mr. C. W. Smith.
10 May 1894.

Reasons for alterations in contracts and systems.

Legal decisions in America and England.

19,632. If you could there would not be much necessity for legislation?—The law of England is very much divided on that point—very much so. But in America I wish to point out that it is only last winter in the Supreme Court that it has been absolutely decided by all the judges present that it was a gambling act, and therefore there is no recovery of differences if a man likes to be so dishonourable as to act on the principle of "heads I win, tails you lose."

American legislation.

19,633. They are introducing legislation in America, are they not?—They are, and the American papers point out that that is a most strong point to have had such a verdict in the Law Courts of America, as it supports further legislation.

19,634. (*Mr. Giffen.*) Can you give the name of a case?—There were, I should think, half-a-dozen cases, but I can give you the case where it has been declared gambling by the Supreme Court:—"Contracts for "fictitious property void—a far reaching decision—"other State and Federal Court proceedings and "opinions." On Monday, December 7th, in Jefferson City, "Judge Burgess, of Division No. 2 of the "Supreme Court, filed an important opinion to-day "in a case involving a construction of the law relating "to option dealings in grain. There was a cross-"appeal in two cases, one by the brokerage firm of

Mr. C. W. Smith.
10 May 1894.

"Conner and Conner, of St. Louis, to recover commission and $4,406 of margins from one Black, and the other by Black to recover $5,000 put up with the firm to hold up a deal on 100,000 bushels of oats. The Court finds that the dealings were purely fictitious, so far as an actual delivery of grain was concerned, and the Court holds that such transactions, under the existing law, are gambling and consequently void. It is held to be the duty of both parties to be apprised of each other's intentions. If even one of the parties to such a transaction is dealing in fictitious property the contract is also void. In referring to the suit of the firm against Black, Judge Burgess says:—'The plaintiffs were 'parties to an illegal contract, which they are now 'seeking to enforce, and in which the law will not 'aid them. It was said in the case of Irwin *v.* Willas, '*supra:* We are of the opinion that when the broker 'is privy to the unlawful design of the parties, and 'brings them together for the very purpose of an 'illegal agreement, he is *particeps criminis*, and 'cannot recover for services rendered or losses 'incurred by himself or in behalf of either in forwarding the transaction. We do not intend to be 'understood as holding that any person, company, 'or corporation may not sell any kind of personal 'property for future delivery which he may not at 'the time have in hand if he intends to deliver it, 'and has it on hand for that purpose at the time it 'is to be delivered under the contract, but if he does 'not intend to deliver it, and does not have it on 'hand at the time it is to be delivered for that 'purpose, he is guilty of a misdemeanour under the 'statutes.'"

19,635. I rather wanted you to refer me to the name of a case?—There are other cases as well.

19,636. (*Mr. Dalton.*) Have you got the names of the English cases?—I have got three or four here. Here is a quotation from the "Financial Times": "In the "Mayor's Court on Saturday, Mr. Taylor, outside broker, of 4, Copthall Buildings, sued Messrs. Wyatt "and Company, Limited, outside brokers, for 10*l.*, "differences in respect of transactions in Grand Trunk "Railway Stock. Plaintiff had bought stock from the "defendants at 41⅛ and sold them at a later date, the "same stock at 45¼, and there was a balance due of "the sum claimed to the plaintiff. Counsel said "defendants sought to set off that amount against a "transaction entered into by Mr. Collins, plaintiff's "partner, in Louisville Stock, with Messrs. Burnett. "The latter firm had not paid the defendants because "Collins had successfully pleaded the Gambling Acts "when sued. In cross-examination plaintiff said he "had bought the stock for a client who was prepared "to take it up. He had sold it on behalf of the same "client. The Common Serjeant: Did you ever place "yourself in a position to hand over the stock? Plaintiff said he did not purchase it. He was simply "acting as a broker. He never on any occasion either "handed over or received stock, but he had paid "differences. Counsel for the defendants called no "evidence for the defence, but contended that on the "plaintiff's own showing it was a gambling transaction. "The learned Judge said the jury had to decide "whether the transaction was a real one, or whether "it was merely a book entry, in which event it was a "gambling transaction and the plaintiff was not entitled to recover. The jury found for the defendants, "for whom judgment was entered, with costs."

English legal decisions.

19,637. (*Viscount Cobham.*) Have you the report of a case which had been tried in the superior courts?—No, that was in the Mayor's Court, and it is from the "Financial Times" of April 23rd. I should like to read you particularly another that I have here.

19,638. We have hardly time to go into these cases in detail?—This is really detail; I have any amount of detailed evidence which I can put before you, but it would take time.

A case in 1878.

19,639. Has any case been brought to a superior court or to the Appeal Court?—I do not think so yet. What I wish to bring before you is that in "Commercial Gambling" I instance a case which happened, as far as my memory brings me back to the year, about 1878, in that panic I have just alluded to. It was the case of a firm called Isaac. Low & Co. I think their differences were about 30,000*l.* or 40,000*l.* I give the particulars in the book. That failure I remember perfectly well. I was not interested in their failure myself, but I remember perfectly well that old Mr.—I forget his name—said, I will not pay any of you gentlemen; because why? You have accepted my commissions for doing this business; you have sold the stuff yourselves, and you cannot be client and principal. I remember that case perfectly well. It was threatened to be taken up to the highest courts in London, but it never went into the courts, and the brokers—a dozen or fifteen of the leading brokers in Liverpool I believe I am right in saying—very soon found out that they were wrong, because whatever Isaac Low & Co. had lost they had won, for they were the sellers. I remember at the time the position put forward in Liverpool *à propos* of that case was to the effect, "Where are we on our con-"tract? Are we to be shot like this if a man loses "money, or are we to receive it?" These cases were going on; there were several of them at the time, but that was the most palpable one. That has lain dormant now up to the last 12 months. It is only within the last 12 months that I notice in almost every paper I take up, either in Liverpool or London, that cases are being tried now from one of these points of view, either from the principal and client point of view, or from the the other point of view which I have tried to bring before you; that is, "Heads I win, tails you lose." It is most important to notice, I think, that the effort to throw out these contracts as gambling contracts in the cases of clients who lose by these contracts is very evidently on the increase. Then, at Question 15,633, Mr. Clay asks, "If I buy wheat why do they not form "the basis of the operation upon No. 1 wheat?" My answer was, "It would not suit the gambler." I had explained the point, I think, in the answer before—what I supposed was meant by the question, and what I meant you to infer by my answer was, that the higher the grade on the contract, as the minimum tendering clause, the better it suited the gambler, who only wished to speculate in paper and in differences. If you will look at the answer to Question 15,634 you will see that is really a repetition of what I have just stated. For instance, the future delivery contract of Californian wheat in Liverpool says, about equal to No. 1 standard of crop, which is the highest standard. The future delivery contract for American red wheat says, of quality not lower than the standard of No. 2 red winter, or No. 2 spring; consequently hardly any wheat can be tendered against the former contract, and very little against the latter. Hence the contracts of themselves forbid it possible for any large tender to be made against them, and are absolutely reduced thereby (as they are) simply to gambling ones in the prices and for differences. I have the contracts for inspection which some gentleman asked for. Those are the contracts at the time for wheat (*handing in documents*). You will find cotton contracts there also, and the whole paraphernalia connected with the Cotton Exchange; they explain the whole position. Then with reference to Question 15,653, referring to a special transaction between A and B, I have written out an explanation of such a transaction as far as I possibly can. I have made it as plain as I can, and I think it is rather important that you should hear it. A, an importer, buys in May, say, 1,000 quarters of foreign wheat at 4*s.* 8¾*d.*, which is equal to the Liverpool spot value. He sells to B, a speculator, as a hedge against this purchase 1,000 quarters, September delivery, in the shape of futures at 5*s.*, A, thus obtaining a premium over spot cost in his sale of futures of 3¼*d.*, B having bought can resell this contract to C, and C to D, and D to E, and E to F *ad infinitum*. You must remember there are hundreds—indeed there are thousands—of contracts floating about between the two markets of Liverpool and America, and the moment those contracts are made they go into thin air. There are thousands and thousands of them floating about between the two markets. Therefore, this actual contract is never liquidated until the end of September under the settlement system, unless by chance B has not re-sold it and sells it back to A. This is most rare, but it is the only way that the contract can be liquidated. If I was to sell a contract every ten minutes of the day, or buy back again, I know no more where that contract goes to than you do—it goes about somewhere. Between May and September on every settlement day all contracts of same month are rung out compulsorily between A, B, C, D, E, F, &c., and the differences due paid or received on these contracts. Thus these contracts are dead contracts, without any tender being made against them, and there is no liability attached to them, and they never again appear in the settlement. That is under my contract which I originated in cotton,

Mr. C. W. Smith.
10 May 1894.

Wheat contracts.

Explanation of a transaction.

Mr. C. W. Smith. 10 May 1894.

and which has gone into the wheat trade. That is the principle and client contract, and it is yet under the laws of England. These contracts which are not rung out continue to come into the settlement every day, until they are rung out or until a tender is made against them. Therefore, you see if we gentlemen in the room were to make contracts every quarter of an hour of the day for a month, I might sell wheat to you to-day, a large line of stuff, and never be able to buy from you that same month until three weeks' time; then that contract that you and I make to-day would go into every settlement until you said "I sell back to you," and then it is rung out compulsorily. The particular contract which A sold to B can be liquidated as far as A is concerned when he buys from anyone a 1,000 quarters for September delivery. This may be any time between 1st May and end September. It is then worked into the general settlement, and only liquidates itself at end of September, unless rung out in the interim by a purchase (which need not be the actual original contract) back from B the original buyer. Or A can liquidate the same by making an actual tender in September to B of 1,000 quarters, but which original contract may have been by that time resold over and over again, say 20 times—aye, as many as ever you like. But remember that every man who buys that original contract becomes a seller himself. He becomes a bear himself, because it does not matter whether it is a re-sale, or whether it is a fresh sale; he is a compulsory seller of that contract. Therefore, that contract may be magnified, as I say, into any amount of times by sales and re-sales, and not only that, but everyone of those speculative buyers who buys those contracts may do—what? may in a falling market or in anything happening in the financial world, or anywhere else, to make that man nervous, sell again another future of a different month as a hedge against that. Therefore, nobody knows how many times the basis of one contract has been multiplied in speculation on the exchanges; and all this fictitious grain absolutely without any tender is floating about on a daily settlement.

19,640. (*Mr. Clay.*) The man that buys in May, does he pay in September for the bales if the contract is not rung out?—I am coming to that, if you will allow me; I explain that a little later on.

19,641. Perhaps you will kindly explain it in answer to the question now?—Exactly; if there was an absolute tender made in September he settles, but then he has to pay cash.

19,642. According to the decrease or the increase of the price?—He has been paying on that on every settlement day. As the market fluctuates up and down he pays or receives every day. If that goes against him every day he has been paying every day, as most men have since 1890 with the exception of 1891. Therefore there is only the balance to be settled on the last settlement, which may be a very small thing.

19,643. That is in September?—Yes, unless that contract has been rung out. It is 100 to 1 that the contract has been rung out.

19,644. (*Viscount Cobham.*) They settle up their differences?—Every day.

19,645. There is no contango or backwardation?—No. That exists on the Stock Exchange only.

19,646. (*Mr. Giffen.*) They have a sort of Clearing House arrangement for setting off one contract against another?—Certainly. For all the different produce they have different rules, and in the grain trade there is a large business done which is never reported at all. In cotton we report nothing, we only make up our weekly settlement differences, and nobody knows anything I have been doing in the week. I may have sold 100,000 bales of cotton, or bought them, and nobody knows except that the market has an idea that I have been a big buyer or a big seller. But in the corn trade there is a certain amount which is what they call registered, but I shall come to that in the fresh evidence which I have prepared. To continue with this transaction between A and B, A can liquidate the same by making an actual tender in September to B of a thousand quarters, but which original contract may have been by that time resold over and over again, say, 20 times. In that case the last buyer of this particular contract finds the cash to pay A, the importer, which is done through the Clearing House, and thus this transaction is finally closed. All intermediate parties (unless rung out as explained by having many dealings of September deliveries together), simply paying up the balance of differences due in this last clearing—which answers Mr. Clay's question I think. But, as explained, tenders are and can be hardly ever made on account of the terms of the contracts, the majority of contracts liquidating themselves as explained above. Tenders are only generally made when there is a corner on, and the cornerers demand delivery against their purchasers, and then only can tenders be made if the sellers happen to hold or can buy wheat suitable for tendering. If they cannot they have to buy back their contracts from the cornerers, and these again are rung out in the settlement, or tenders are made when the contract price of the month sold, owing to the manipulation, is higher than the market price of the wheat itself, or, again, when the importer wants to raise cash. Those are the three principal causes which cause tenders to be made. The importer A may, however, between 1st May and September have made 10 distinct and separate sales of futures against this one purchase of actual foreign wheat sold to B. That is buying back from any one September in flat markets and hoping to let them out again at more money. Or he may sell other months instead. In this way he hopes to hit the ups and downs of the market and make many small profits on paper thereby or losses if his judgment is wrong and the market does not go his way of thinking. But remember, if he has taken in his hedge *pro tem.* with the idea of a small re-action upwards and he is wrong, why he lets out his hedge in the shape of another sale of futures at best price possible so as to be covered in case of a further decline. The profit to the importer depends then more upon his manipulations in the future market than in a profit in his real wheat. His profit lies in futures. If he can make 10 or 20 successful ins and outs on that gambling market on paper he can afford to sell the wheat at any price. And therefore, as I say and have explained, he is more interested in a succession of declines than of advances, declines suit him far better from every point of view, because he is a bear on paper.

19,647. Why should he import the wheat at all?—There you ask me a very peculiar question. I have been in business all my life and personally as a man of business I have never imported anything; I have sold it short without any bother at all, and made the money. If you come to ask me a plain business question, I have been astonished by seeing men worrying themselves with importing anything at all when they can by simply selling, and selling without importing anything at all, make money by the end of the week, and pocket the difference and put it into their banks.

19,648. (*Mr. Lambert.*) Do the speculative buyers or the speculative sellers never make any losses?—The latter very seldom. I have explained in "Commercial Gambling" very clearly that the majority of speculative operators in England, I put it at 99 out of a 100 or 999 out of every 1,000 men are bulls; the bears principally in England are the men who import the wheat on the basis of these systems. It is the basis of importation which is so rotten because it is simply reduced to a gamble in the price of fictitious commodities on paper, and it is quite immaterial what the value of the real wheat is.

19,649. (*Mr. Giffen.*) They do not need to import the commodity in order to gamble?—You must remember that a man goes into a business on the supposition that it is a business. We cannot all live upon gambling, there must be some basis. A man wants credit, he must show the nature of his business, and that he has got money. One thing I can say is that, by the aid of these systems, the whole business of this country is absolutely reducing itself to a mere gamble pure and simple.

19,650. (*Viscount Cobham.*) Would you say that a man can gamble without importing, but that he cannot import without gambling?—That is quite right, and that is the great point on which I gave my evidence last time I was here—men with 50*l.*, 100*l.*, 200*l.*, 300*l.*, 400*l.*, and 500*l.*, have been introduced into the business, and they import thousands and thousands of pounds worth with their small capital and have driven out of the importing trade the old-fashioned English merchant who had his 100,000*l.*, 150,000*l.*, 200,000*l.*, or 300,000*l.*, and imported stuff legitimately into this country without selling options and futures. This stamp of merchant has been beaten out of the trade. I think I did on a former occasion as far as I could explain that. The systems have introduced quite a new class of men, and the basis is now reduced to a gamble.

Mr. C. W. Smith. 10 May 1894.

Mr. C. W. Smith.
10 May 1894.

19,651. I understand you to say that generally all importers are bears?—The importer must be a bear—on paper he must be. I have done it myself. I have imported for clients. As I have explained, I have been a broker and perhaps the most legitimate broker in this country—that is a broker acting for clients as much as I possibly could in business. I have often said to a man: "Now just import sugar, or wheat, or cotton, "any article you like, and let me manipulate on that "operation." Why, gentlemen, I have done 20 or 30 or 40 successful bear operations for that man. Sometimes I have sold double the quantity of stuff he had and made a double profit. I have never looked at the actual value of the real stuff at all. I have always been covered in case the market declined. Sometimes I have sold considerably more than I held for the man, making profits for him, and handing over the differences, and at last he has got so much profit on paper in hand that he has said, "Sell out, and hand the stock over." I have alluded to A, the importer or say a bear—and bears, you must remember, include importers who sell, although we have got a whole class of bears and illegitimate operators who sell without holding anything at all—obtaining a premium of 3¼*d.* on his sale of futures. Let me show how this is in favour of the bear. Say price of September delivery is 3¼*d.* higher than the spot price in May, and the latter remains unaltered during the whole period, the result will be that this 3¼*d.* will be gradually absorbed by the bear; the nearer September is approached so will the premiums decrease, and by September the whole of the premium will have fallen entirely into the bear's pocket. In the meantime the bear and his brethren will have succeeded in beating down spot prices, so that the bear not only gets the 3¼*d.* premium which he obtained at the time of sale, but he also gets the reduction in the market price as a further profit, and very often in flat markets, and always in panics he witnesses the month he obtained 3¼*d.* premium for go to a discount under spot which gives him another profit. On the other hand B, or a bull has to wait for a rise of 3¼*d.* in actual wheat before the spot price comes up to the price which he bought the September delivery from A at, and all the time he is witnessing this premium gradually disappear as the month of September draws near. You will see the great difference between the bull and the bear on the Stock Exchange from that point of view, and the bull and the bear on the Produce Exchange and the unfair handicap on one.

Difference between Stock Exchange gambling and options and futures.

19,652. (*Mr. Giffen.*) Does not the spot price and the account price approximate as the settlement day approaches on the Stock Exchange?—Yes; but you do not pay any premium on the Stock Exchange; you buy at the market price, but there are not what you call heavy premiums.

19,653. There is a difference between the spot price and the account price at the beginning of the account, but that disappears as the account goes on?—Exactly, but still there is not the big premium that there is upon distant options in produce. Remember also, the premium of 3¼*d.* which A, the importer, or say, a bear obtained is really illegitimate, because the bulk of these future contracts are only a gamble in the prices or a bet on the market and based on paper wheat. If they were *bonâ fide* transactions and carried actual wheat against them, the premium would be legitimate enough, as the premium is only supposed to be equal to what is termed a carrying power—that is the expense of carrying wheat from month to month—while as far as B, the bull or speculator, is concerned, it would cost him say about 1*d.* per cental per month to hold wheat from May to September, if he had speculated in May and bought actual spot wheat for a rise. This latter class of speculative business is however dead since the introduction of the gambling systems. Then in the answer to Question 15,663 I said that I was a sleeping partner in a firm——

19,654. (*Viscount Cobham.*) That has been corrected in the proof?—Yes, but I should like to explain this because it is a most important thing for me. It is a personal matter entirely. I used that term "sleeping partner," but it certainly was not right, because when I left the firm some five or six years ago, I simply made a sale of the firm for the benefit of two sons of mine at a very long date, as the men had not the money to buy me out of the firm at once. I should be very sorry indeed if I should be thought to have used the word "partner" before any official body at all, because in the event of that firm failing, they could throw it in my teeth that I had declared I was a sleeping partner. I am no more a partner, gentlemen, than any of you in the room; therefore I should like to contradict that most plainly. Then in answer to Question 15,688, I have at the last sitting put in a copy of the Hatch Anti-Option Bill which was before the House of Representatives. I should like to read that. The Secretary has had in his possession the corrected Anti-Option Hatch Bill some three weeks. The Bill which I produced in this room on the 6th April has been corrected by gentlemen I have been in communication with in America. The most important alteration in it I notice is that all dealers in options and futures have to find a bond with at least two sureties for a penal sum of 3,000 dollars. I think that is a very strong addition to it, because that is a great deal of money for any men to find who wish to have any dealings on the produce exchange or any dealings outside the exchange, whether they are private individuals living in the country or elsewhere. The Secretary has also had a copy of George's Bill as introduced into the Senate. This Bill simply proposes to make all dealing in options and futures a misdemeanour. In further answer to Question 15,710—I think Mr. Chaplin was interested in this—I can now give to the best of my belief the various steps taken by continental nations to prohibit bourse and produce speculations. I have got, as far as I have been able to gather them from the papers, the various steps which have been taken in the last 12 months by the various nations. It may be interesting to have them.

Mr. C. W. Smith
10 May 1894.

American legislation. The Hatch Anti-Option Bill.

The George Anti-Option Bill.

Continental legislation.

19,655. It would be sufficient if you gave us the present position of legislation with regard to these matters?—As far as I can make out all the steps taken have been done in the last 12 months. I can give you what has been done in Russia and France, and I can give you what Germany is going to do now. As far as Russia is concerned, some 15 months ago the Imperial Bank informed the St. Petersburg and other banks by circular that in order to place obstacles in the way of speculative operations, it will grant no advances or call except to such an extent as may be required by the effective withdrawal of deposits by banking customers, or by the needs of commerce. Further, Russia, as far as I can make out by the German papers, which are the papers which have been sent to me lately, has prohibited business for future delivery unless the seller can prove that at least one-third of the goods are really existing. I believe also there is a heavy penalty attached under this law. As regards France, on January 30th, M. Vigier, Minister of Agriculture, announced that the Government would the next day present a series of measures destined to restrain speculation. Those measures would comprise the diminution of time, during which wheat may be left in the depôts which enables large speculators to house wheat for several years.

Legislation by Russia.

Legislation by France.

19,656. You have given us that, I think?—Yes, I read to you that. On February 10th the *Standard* has it that the Ministerial Bill reducing to one year the period for which cereals may be bonded was signed by President Carnot. As regards Germany, since I was in this room last, you may have noticed that the German Government has really passed the German Bourse Taxation Bill, and that the same came into law on the 1st May. That is following the steps that France has already taken, and which I dwelt upon when I was in this room last. As regards the steps taken in Germany at the instigation of the Landlords' and Farmers' Alliance for the last 12 or 18 months, I have been in communication with them at Berlin, and I received this letter last week, which I should like to read to you, showing the latest in Germany on this very topic which I am urging before the Commission:—"I beg to acknowledge receipt of your letter of "23rd April, and to communicate to you the informa-"tion which you desire in reference to your inquiry "as to the position of the question of the reform of "the Exchange in Germany. You have been correctly "informed if you presume that the Exchange Tax "Law, which came into force on the 1st May, contains "no proposals of reform effectual and general, and "that the Produce Exchange is not changed thereby "in its customs. On the other hand, it was rendered "conspicuous on the part of the Government, in the "proceedings of the Reichstag in connexion with the "Exchange Tax, that a law for the organisation of "the Exchange was in preparation, and that it would "probably be brought in during the next session of the "Reichstag (1894–95). The Imperial Government"—you will note that it is the Imperial Government that

Legislation by Germany.

Mr. C. W. Smith. 10 May 1894.

is bringing in this Bill—"keep still secret the details "of the organisation planned; still, it is generally "assumed here that the reforms will only conform "themselves with the proposals of the Commission on "the Exchange Quota which sat until the autumn of "1893, and by this time has published rich material in "the shape of eight large volumes (shorthand reports, "reviews, statements, and statistical supplements)." Germany has been, I should think, for the last 18 months since it was brought before their notice taking similar evidence to that contained in the bound volume of the American Commission which lasted three years in America. That evidence has been published in eight large volumes, and on the basis of that the Imperial Government are now framing a Bill which I will read to you the particulars of as far as they are known, although the Government, as you see, keep them secret:—"The proposals of the Commission as "far as they touch the Produce Exchange amount "substantially to this:—To restrict the circle of those "admitted to the business of the Exchange. To "prevent the public as much as possible from "speculating themselves or through brokers. To "bind everyone who deals in the Exchange to allow "himself to be inscribed in an exchange register, &c. "The Commission hope by this measure to limit the "business in differences, and to procure again a safe "basis for the real business. The proposals of the "Commission on the Exchange quotations have "produced a general disillusion, specially among the "agricultural lists, owing to their less effectual "character. Therefore, the fear appears justified that "justice will not be done to our demands by the law of "which prospects are held out to us. The Board of "the Agricultural League have from the beginning "endeavoured to collect all materials relating thereto "in order to be able then to make effectual improve-"ment proposals on the Bill of the Government." I might say that that took place in exactly the same way as on the American phase of the question. It is the Farmers' Alliance that keeps making the different suggestions to the Government. "For this reason I "should be particularly grateful to you for all "communications enclosed, and I specially request "you to communicate to us, if possible in print or in "writing, the respective American law proposals (Anti-"Option Bills) which you mentioned in your last "letter and which appear to you accessible." He then urgently hopes that this country will look into the question.

19,657. That is to stop all gambling in futures and options in produce?—In everything, just like the American Bill. Since I was in this room last I think it is also most important to read to you what has actually taken place in the Reichstag some three weeks ago. Count Kanitz had a motion before the Reichstag on this very question. He had been anxious to bring a motion into the House for a State monopoly, that is for taking it entirely out of the Produce Exchange's hands. The extract that I have here says:—"The publication of the Kanitz motion, "which wanted to see the trade with foreign bread "stuffs placed in the hands of the Government, "produced a real howl of rage in all the democratic "newspapers; indeed, the large corn chafferers"—who are the speculators—"saw themselves in spirit already "deprived of the millions which the far from arduous "Exchange business brings them now yearly." "Now "in order to help again a little the distressed German "agriculture as against the powerful foreign com-"petition, and at the same time to allay somewhat the "unheard-of speculation in bread stuffs, Count Kanitz "brought in his well-known motion in the Reichstag "which was unfortunately rejected by a hardly "competent House; there were present only 205 "members as the voting showed, and to form "a quorum at least 199 of the whole 397 members "were required; therefore there were only present "six votes beyond the number required to decide." It goes on to say that the newspapers took it up like the American papers. What I have tried to show you and to explain to you is that it is only in the last 12 to 15 months that first one nation and then another has absolutely become in earnest over these gambling systems. You must remember that in these countries which are taking these strong legislative steps this legislation has been entirely brought about by the pressure from the landed interest and from the farmers' alliances in the various countries. I say in my evidence—which I think is perfectly true—England being a free trade nation has absolutely been considerably more hurt, as I shall show you later on by some very important evidence I have got from America. Therefore it is of far greater interest for England to take this question up which I am expounding before you now than for protectionist countries like America, Russia, Germany, and France. The Standard, May 17, says:—"The Argentine Government intends to appoint "a controlier of the Bourse, who will require to be "furnished with the names of all persons concluding "time-bargains." This is important, because these time-bargains affect the currency which has been and is giving temporarily the Argentine farmer such an advantage over other countries. Still it is well to remember this appreciation in gold is put forward as the ruin of other countries and of farmers in other parts of the world. A prominent agriculturist in Belgium writes to me to forward my book, "Commercial Gambling," as he is putting together considerations on the subject concerning his country which will be published in the leading agricultural journal. I mention this fact to show that yet another continental nation is looking into these systems. Then in Questions 15,715 and 15,716 I was asked about stamps. I wish to add that, as regards stamps used on future contracts, I find in the Liverpool Cotton Exchange they are now only required when a tender is actually made and no contracts are registered. Hence few stamps are required. In the Liverpool Grain Exchange a stamp is required only when a contract is registered or a tender made—a 1*s.* stamp on every 100 bales of cotton and a 2*s.* stamp on every 1,000 quarters of grain. Stamps are issued by the Clearing House. Hence no profit or loss to the Government, the great loss owing to the above new rules falling upon the Clearing Houses. Consequently all contracts which are not registered and have no tenders are rung out by the means of the settlement system and carry no stamps nor have any charge whatsoever upon them. Registering a contract is not compulsory; hence the great majority of future contracts are not registered and are not reported. The only object of registering is to ensure the payment of margins on a rising or falling market, and requires the consent of the buyer and seller. It is a mutual arrangement. I think that answers the various questions put to me on April 6, as regards stamps, &c.

Mr. C. W. Smith. 10 May 1894.

Legislation by Argentina.

Belgium.

Stamp and registration of contracts.

19,658. They trust each other; that is, it is a system of mutual trust?—That is so with the strong men for various reasons if they do not want to register contracts; it is more convenient. Suppose you were a merchant operating through six brokers under the present contract, of principal and client, you only deal with those brokers; therefore every time you deal with those five or six brokers, every time you buy or sell with them that contract of the same month is rung out and your liability ceases. When the ordinary run of people, who are the weak people in the market, have to deal, they take good care to be registered, because then it is an absolute certainty and their margins are paid. At Question 15,727 reference is made to the number of quarters of wheat sold in a day. Over 2,000,000 quarters of wheat were sold in New York alone in one day.

Sale of futures New York.

19,659-60. Actual wheat?—No, futures. 2,100,000 quarters of wheat were sold about a week before I was in the room last April. The spot sales were reported nil; and the total export of real wheat for the whole week to all Europe was under 400,000 quarters. That only refers to New York alone, but there are four or five other places where Futures are sold, such as Duluth and Chicago. I just mention that to show the enormous Future business that is going on and how it is increasing. Then at Question 15,735, I am asked, "But "why should there be a foolish buyer who does what is "clearly not to his own advantage?" I am sure, gentlemen, if you read "Commercial Gambling" from page 140 to 151, and also my printed statement of evidence on this subject, and the answer that I gave to Question 15,733, you will see why the foolish buyer is caught upon every opportunity. I refer specially to those answers, and especially to those in "Commercial Gambling." It is a long thing to go into but I thought I would like to refer to that particularly. Then I should like to refer to Question 15,774 and the cross-examination that took place by Mr. Giffen. I think a definition is required as evidently Mr. Giffen and myself look upon the middleman in different lights. I have always looked upon middlemen in the commercial world as wholesale markets as those who profit by or deal in or who handle the produce from the time it leaves the foreign farmer (as explained in previous

Middlemen.

Mr. C. W. Smith.

10 May 1894.

answers, to Mr. Giffen) to the time it reaches the cotton spinner or miller. In the retail market I look upon the middleman as the dealer. The baker and butcher may turn themselves into middlemen by dealing, but their business, as a rule, is again distinct. The miller is not a middleman, as I stated in Answer 15,774. The miller and cotton spinner are distinct businesses. The miller has really been a loser by the enormous imports of foreign flour as also by the enormous fluctuations principally downwards in wheat the past few years. As I stated in Answer 15,774, the systems of selling flour ahead are largely in vogue (see pages 85 to 86 of "Commercial Gambling"), and also remember millers are large speculators themselves. They sell largely options of flour ahead and either cover themselves by buying wheat options, or they sell the former pure and simple without covering themselves by wheat, and consequently become bears of flour. The London Produce Clearing House, I may remark, some two or three months ago wanted to drag the question of flour into their systems, and a contract was framed with that object and for one or two days they gave the actual future quotations of flour. But I believe that the Millers' Association in London would not have this contract at any price, and the consequence was that it was dropped *pro tem.* That is all the further evidence that I wish to give on the cross-examination. I desire to put in, as further evidence which I consider most important, the Report of the Sub-Committee to the American Senate on Agricultural Depression in the United States, and its causes and remedies, which is just issued, and which only came to my hand last week. That confirms not only my views about the gambling systems, but also corroborates many important parts of my evidence, both from the agricultural, commercial, and financial points of view. I wish specially to refer to pages 6, 27, 28, and 53, as regards the market price of the American surplus of wheat being fixed by Liverpool, and that the export price, to a large extent, controls the price of wheat as sold in the home markets of America; also the remarks on page 29 about the Liverpool price governing the prices at other places, and the remarks about Indian wheat competition with American. I think it is most important to put those extracts in as evidence, because they really corroborate me in so many important points as regards what I have always maintained right through with regard to this important question, namely, that it is the Liverpool price and the Liverpool contracts which regulate the price of wheat all over the world. That Liverpool contract does it all, and it is a gambling contract in options and futures for differences.

Future contracts in flour.

Report of the sub-committee to the American Senate on agricultural depression.

Liverpool contracts and the price of wheat.

19,661. Is this report to which you refer a recent report?—Yes; it is like a Royal Commission Report to the Senate. It is just issued.

19,662. It would be useful if we could have copies of it?—With your permission I should like to put in this copy as evidence, and you can keep it as long as you like There is only one other copy in England that I know of, and I can make use of that. On page 6 of the Sub-Committee's report in plain language it says: "The market for wheat in the United States is fixed "by dealers on the Board of Trade in Chicago"—that is the produce exchange—"and for all the surplus "wheat and corn exported the price is fixed in Liver-"pool, England." I think that is plain enough. Then on page 27, after augmentative evidence, it says: "When it is considered that the market price of our "surplus wheat is fixed in Liverpool, England, and "that the export price to a large extent controls the "price for what is sold in the home markets it is "readily seen"—so and so, and the report goes on to explain that all Europe is practically self-supplied with wheat, the only exceptions being the United Kingdom of Great Britain and Ireland, and Belgium. I may remark that Belgium is a small place, and has none of this gambling going on at all—none that I know of, at any rate. It goes on to say: "With "these two exceptions the different countries of Europe "are able to supply one another with all the wheat "they need in average years. For all practical pur-"poses it may be said, therefore, that the wheat "required by Great Britain and Belgium composes "the quantity which is known as the world's demand, "and to supply which the farmers of all wheat export-"ing nations are in continual competition." Then, after again giving the particulars, it winds up by talking about their business. It says: "If the Liverpool "price governs prices at other places it is easy to see "that Indian wheat competition in that market to the "extent shown in the foregoing figures does injuriously "affect the price of American wheat."

Report of the American sub-committee.

Mr. C. W. Smith.

10 May 1894.

19,663. (*Mr. Giffen.*) It does happen sometimes, I believe, that the price in New York is higher than the price in Liverpool?—If there is a corner on. I give you the strongest evidence of that. Of course, if there is a corner and manipulation, that draws it up unnaturally; but there is always a tremendous smash after that in every year when there has been a corner. I gave you the particulars of the 1891 panic. I gave you also the particulars of the Cudahy Syndicate, a large syndicate which was formed at Chicago last year. Prices are something like 36 per cent. down from last May in America since Cudahy failed to corner wheat. The whole fall is artificial from beginning to end. However, I think when you see this report of Mr. Peffer, you will see that it bears out what I have tried to explain, and which has been my sole point, namely, that it is the value of the American and English future gambling contracts in the American and English markets which rule the price of wheat. It is wheat versus wheat; it is not wheat versus wheat and silver, or wheat versus wheat and gold. It is a competition between wheat versus wheat which is doing the damage, and the prices of options and futures ruling in America and England are the prices regulating every part of the world, including our little country towns in this country. Our wheat comes into competition with the foreign wheat, and the American price and the price at Liverpool, England, is the price that rules. Consequently, that being so, if I can prove, as I will do, that that contract which rules the value of the wheat all over the world is a gambling bit of paper contract, that only bears out what I have tried to show, that it is the ruin of the world, and that this whole decline is artificial and fictitious. This report also goes into the question of futures; and after giving it as one of the causes for the decline, the sub-committee go on to give national legislation as one of the remedies. They divide their remedies; they say the farmers can do so much, and other people so much, and that other things should be done by national legislation. The Report says, at page 102:—"Having discussed this subject," that is futures and options, "somewhat at length when "assigning causes of depression, nothing further is "needed in this place than to demand that the business "be abolished and prohibited under heavy penalties. "It ought to be made a felony and punished by im-"prisonment. If the business is wrong in itself and "hurtful, it ought not to be tolerated."

Corners in wheat.

Report of the American Sub-committee.

19,664. Can you tell us how much wheat is under contract to be delivered on the Liverpool grain market to-day, for instance?—Nobody has the faintest idea.

Amount of wheat under contract in Liverpool.

19,665. You have never made a calculation of how much is under sale, under obligation to be delivered?—It is quite impossible, as I have explained to you. Do you mean in options and futures?

19,666. No, the whole amount that people are under obligation to deliver at one particular time?—No.

19,667. How much is outstanding?—I think it is quite impossible to get at such a figure.

19,668. Would it not be all known with these daily Clearing House arrangements?—No, as I have explained to you under the Liverpool wheat rules it is not necessary to register every contract. There is a very large business done which nobody knows anything about. Suppose you yourself were a large buyer of wheat in America yesterday or in any other part of the world, and you had a very large line of stuff on hand you would not like everybody to know that you were a very large seller of futures—not at all, that business is kept a dead secret. In the cotton market we never register anything, it is a dead secret. The Clearing House can, however, find out in cotton how much is sold, because they can calculate the fall in the market on the week, and they know that so much is paid in the balancing. The Clearing House can find out that and estimate exactly how much.

19,669. That is exactly what I meant?—In wheat you cannot do it.

19,670. Why not? Surely some of the leading people in the trade could make a calculation for their own information—I would like to know how much is under obligation?—It is quite impossible—absolutely impossible. The Cotton Clearing House can do it, but with wheat it is quite impossible for the reasons I have given you.

Mr. C. W. Smith. 19 May 1894.

19,671. But surely from the amount of money passing on differences and things of that kind, you would get to know how much is outstanding at any one moment?—I have told you that there is a great deal of this done which is never reported and never registered at all, but which is kept a dead secret.

19,672. But still the leading people in the market must know about it?—They may guess it. Remember, the American future markets are largely used also as the basis for importation into England.

19,673. If it is only a rough sort of guess I should like to have it for our information?—It is a thing that I could not absolutely give you the slightest opinion on and if any man were to make a guess I should laugh at him myself.

19,674. It is quite possible that crops may be sold over and over again in the course of 12 months, but the amount under sale at any one moment may not be so very large?—Of course the markets are bullish and bearish, that is known. If a market is a bull market the people know it, or if it is what they call a bear market they know it, but as for the extent of the business I do not think anybody would know, and I do not see how it is possible to get at it. Perhaps no man in England has ever tried to make greater guesses than I have, and published them and based my views and prognostications on the future upon what I have worked out for myself, in fact I am at the present moment deeply engaged on this very question as regards cotton, but there of course it is a dead secret.

19,675. What I really wish to get at is how to form some notion of the amount of speculative business in proportion to the real wheat that is to be sold?—I do not see how it is possible to get at that in any way. You can get at it as far as it is reported in the Clearing House annual statement. I have got a copy if you would like to see it. It was published about a month ago. This is from the annual statement of the Liverpool Corn Clearing House for the year ending the 31st March 1894. That statement gives a variety of figures, but it is not worth the paper it is written on, as an example of the whole business done in futures, for, as explained in my evidence, a large quantity of foreign wheat imported into England is hedged by futures sold in America.

19,676. Because it does not include all the transactions?—Not at all. As far as it goes, I think it will be perhaps most interesting for you to know the number of contracts that were registered. The actual tenders made against those contracts as far as they were registered were infinitesimal, there were no tenders in fact. The figures are: 3,810 centals in the 12 months ending 31st March 1894, were actually tendered against 12,235,000 centals sold.

Classes of wheat affected by gambling.

19,677. I think you told us that not only are there sales of wheat which the people have not got to deliver, but there are sales of certain kinds of wheat which hardly exist at all, and a large part of which is not of the description which could be delivered?—Exactly.

19,678. Can you explain to us how the kinds of wheat which are not capable of being delivered—which are out of the market as it were altogether—are affected in price by these gambling transactions in things that do not concern them at all apparently?—Do you refer to a lower grade of wheat?

19,679. To a different class of wheat?—How they are affected?

19,680. How a class of wheat is affected in its price by the sale and purchase of some other kind of wheat altogether which perhaps hardly exists?—All classes of wheat are absolutely regulated by the quoted value of the option and future contracts.

19,681. Why are they so regulated?—Between America and Liverpool, although they cannot be tendered on those contracts still the value is regulated, because they are sold as a hedge against these either in America or England.

19,682. If I have a thing to sell which somebody else wants to buy, how is our dealing affected by the fact that some other people—strangers to us—had been dealing in another article altogether?—Say that everyone of you gentlemen on that side of the room are legitimate importers holding any class of wheat in any part of the world you like, and we on this side of the room are dealers in futures and options. We have imported wheat and so have you. You may vary your class—No. 1 or No. 2, certainly; you may say "We are not going to sell options and futures"; quite right, you do not, but we on this side of the room have sold options and futures, and we have done so on the basis of a contract which brings down your holdings to the value of that which we have sold. That is how these options and futures work.

Mr. C. W. Smith. 10 May 1894.

19,683. Yes, but my point is that the options and futures are dealings in one article, and that the article which I have got to sell is a totally different article?—I quoted here, if you will allow me to read it——

19,684. No, I think we must not have any more reading?—I have dwelt upon all that in "Commercial Gambling," and in my printed evidence.

19,685. You cannot carry it any further than that?—Oh dear yes! I can carry it very much further. I myself have imported East India cotton as against American cotton futures. I have also imported cane-sugar on the basis of a sale of the beetroot sugar future contracts. It does not matter where the grain is; it may be grown in any part of the world; I will import it to-day and I will sell against it the future contracts, such as are used in Californian or red American wheat to-day. To further explain, I should like to quote the words of Mr. Hatch from the Committee on Agriculture to the Senate in America, and which I put in as additional evidence. The fifth object by his Bill introduced into the House of Representatives is worded as follows:—"To prevent the overloading of domestic "markets and the breaking down of prices of farm "products by short sales made by foreign merchants, "for the purpose of insuring them against possible "loss on purchases of Indian, Egyptian, South "American, Australian, and Russian produce, whereby "the American farmer and planter are made under-"writers of commercial risks of the European, by "whom no bonus or premium is paid for assuming in-"surance risks that destroy the value of our products."

19,686. I can understand that if they were dealings in real wheat to a large extent, but I understood your point to be that people dealt in a kind of wheat which hardly existed at all?—I say the minimum grade on that contract which can be tendered is so nigh that it reduces the possibility of any tender on that contract to a very large extent. In the evidence that I gave in this room the last time I was here, I read out to you what Mr. Wood Davis of Kansas said in his evidence before the American Commission.

Minimum grade on contract.

19,687. That only proves the point that I desire to make, namely, how can dealings in an article which hardly exists, and in which anything may happen, regulate the price of immense quantities of actual stuff which some people have got to sell and other people can buy?—Say you are a buyer or a seller of any class of wheat or any class of produce you like which comes under the systems, that price is regulated by the price ruling in Liverpool or America to-day.

19,688. You have just been telling us that the thing in which people speculate is a non-existent class of wheat to all intents and purposes?—It is to a very large extent by the words of the contract. I can give you the strongest evidence of that to-day. I will take the Liverpool cotton market to-day. There has been a small crop of American cotton; there has been a panic in Liverpool lately, the old story, always a panic; cotton is very low, 3¾*d.*; there are thousands and thousands of those contracts floating about to-day. Now my information yesterday from my late partner was this: that almost every bale of that cotton, owing to a high class crop in America this year, is tenderable under those future contracts, but there is nobody who tenders it. The whole market is being regulated by the price of May deliveries and futures. It does not matter who holds it, or whatever part of the world you are in; if you wire to anybody what is the value to-day of any wheat you like, "What is the value of futures" is the first thing that is asked; so-and-so is the answer; you make them your value—the value is not made by the price of real cotton or wheat itself.

Values regulated by option and future contracts.

19,689. If in dealing in futures they are dealing with a real article, I can quite understand, but I understood your whole point was that it is not a real article?—It is not; it is dealing in prices and in differences of a paper contract in fictitious wheat or cotton.

19,690. Then how can it affect the price of anything else at all?—Suppose, for argument sake, that the price to-day is 20*s.*, and that you are in Liverpool or London as a merchant; you say the value is 20*s.*; you are only a buyer on the basis of 20*s.*; you are not giving

Mr. C. W. Smith. 10 May 1894.

any more; you are not going to import wheat for the British public for the love of importing it and feeding them. You go entirely upon the value of the price of the option contract in Liverpool, or London, or America.

19,691. What is the use of my purchasing an article which I cannot get?—But you can get that.

19,692. But you said just now we could not?—Could not get what?

19,693. It could not be delivered, you said?—No. 1 wheat, you mean, a high class wheat.

19,694. I do not mean any kind. You told us there were dealings in a kind of wheat which could not be delivered?—I say a very large part of it cannot be delivered owing to the minimum clause being in the contract.

19,695. Then would you say now that there is a sufficient quantity which could be delivered?—A certain quantity can be delivered. I would refer you to the American evidence. I quoted you one case about Kansas, one of the largest wheat producing States of America, and this contract is applicable to America as well as to England. Mr. Wood Davis, in his evidence, said that 98 per cent. of that wheat did not grade up to No. 1, hence it could not be delivered; but that it was the value of that contract (according to which nothing under No. 1 could be tendered) which regulated the price of the remainder, viz., 98 per cent. of the wheat which graded below No. 1.

The wheat corner in 1893.

19,696. So that a buyer, if he wished, could buy up all the quantity of that wheat that could be tendered quite easily?—We know perfectly well that Cudahy bought considerably more last year than could possibly be delivered to him in the month of May; and that that was the origin of the corner.

19,697. Did that corner affect the price of other wheat which was not tenderable?—To a certain extent, undoubtedly.

19,698. In what way?—It would raise the value.

19,699. In what way?—Because, naturally, if you are a miller and you want to buy wheat, and this contract wheat, No. 1 wheat, which is held by a cornerer, is so much dearer in comparison with another class of wheat the miller says, "I am going to buy the cheapest class "of wheat, I do not buy the cornerer's wheat if it is "dearer."

19,700. According to what you told us, the dearer class of wheat you practically could not buy at all, because there was hardly any of it, and nobody could have bought much of it?—Are you talking about No. 1 wheat?

19,701. Yes?—There is a certain quantity of it, but it is infinitesimal.

19,702. Then if it is infinitesimal, how can the diversion of the millers' purchase from that class of wheat to other wheat be a very material thing?—There is no reason why he should buy No. 1 wheat. I saw, in 1883, Morris Ranger corner the whole of the Lancashire cotton trade for from three to four months. I saw the spinners shut up, and I have heard Morris Ranger say to those Lancashire spinners on the Liverpool Exchange openly, "This is the corner price, 7*d.* a "pound to the men who are short on a paper contract, "but you are a Lancashire spinner, and you shall have "the cotton at 6½*d.*" In thousands and tens of thousands of bales of cotton I saw him do that day after day. Now you can understand what a corner means. He was selling it to the consumers to get rid of it and raise cash in order to buy more futures to keep up the corner.

The Liverpool cotton corner, 1883.

19,703. He was selling it at a different price from what he was selling the other cotton?—From what he was buying futures at; the bears were all suffering.

19,704. That is a case, is it not, of the real produce going at a different price from the speculative produce?—I give you that one case to show you to what depths a cornerer will be forced when he wants to get rid of his stuff in order to make the corner; that shows what he will stoop to do.

Values regulated by option and future contracts.

19,705. That proves, does it not, that the speculative price does not regulate so much as you led us to believe the actual dealings in the real stuff?—Nothing else regulates, the price—nothing but the price of the gambling futures contract in every article of produce. There is not a single thing that regulates price except the value of futures in America and in Liverpool—whether it is wheat, cotton, sugar, silver, or anything you like.

Mr. C. W. Smith. 10 May 1894.

19,706. You have just given a case——?—I have tried to bring home a case, only one case, which has happened in the commercial world. It was a case which was notorious in the commercial world, and I am prepared to give in my evidence the names of the people who did it. I did see that man ruin the Lancashire cotton industry, and he was supported by the biggest brokers and most influential bankers in Liverpool and London.

19,707. As a matter of fact, the real cotton was sold at a different price from the speculative cotton?—It was sold, as I have tried to explain to you; why? because he absolutely had to get rid of this stuff. It broke him in the end, but it kept him financially alive for three or four months by doing such a thing as this.

19,708. Still, as a matter of fact, the real price—the price of the real stuff—was different from the price of the speculative article; they did not follow each other at that time?—Undoubtedly they did; because there was only one man who held the stuff in Liverpool.

19,709. But is it not to be supposed then that in other cases where the real price and the price of the speculative article correspond, the reason is that the speculative price follows the real price?—The speculative price never follows the real price in anything. It is the real price that is guided absolutely and solely by the speculative price.

19,710. If in such a case as I have mentioned the price of the real article is actually different from the speculative price, is there not fair reason to suppose that in other cases where the speculative market and the real market, as I call it, correspond, the correspondence is due to the speculative market following the real market, and not *vice versâ*?—Hardly ever. The principal way that the speculative market follows *pro tem.* the real market is when there is a very large demand from spinners or from millers. Then the only advance that is gained, and which I dwell upon as plainly as I can in this book ("Commercial Gambling"), in order to show the rottenness of the systems, does follow; because why? Because the importers who are short when they sell their actual stuff in large quantities to the consumers are compulsory buyers at the market price ruling that day in futures, and hence the bigger the volume of spot business the bigger the volume of compulsory buying back of futures.

Gambling in options and futures and Stock Exchange speculations compared.

19,711. Is it not the opinion of many of the expert people connected with the Stock Exchange that in that market at least the speculative price rather follows the real dealings?—I have never had a speculation, as I told you, on the Stock Exchange. I hardly know any Stock Exchange broker. I know no more personally about the Stock Exchange gambling operations than a child does. They are absolutely different from beginning to end, and therefore there is no comparison.

19,712. Coming to that point as to the difference; do you still think that the essential difference between speculation on the Stock Exchange and speculation in futures in grain is that the grain is an imported article?—Not only that, the whole thing is different.

19,713. What difference is there?—The whole basis is different.

19,714. How can you tell us that the basis is different if you do not know anything about the Stock Exchange?—I have tried to show you for one thing that there is always a heavy premium on distant futures which is always in favour of a bear instead of a bull. That is one important item. Besides in "Commercial Gambling," as I have explained to you, I have dwelt upon the difference—I think it is very clearly put there; and I now confirm it as my answer to your question.

19,715. I have read all your books, and I am bound to say that I cannot make out any difference between the dealings which you describe and Stock Exchange dealings, with which I have some familiarity?—I have no familiarity with Stock Exchange gambling.

19,716. It seems to me that you describe exactly the same things, and I want to get from you, if you can tell us, what is the difference between the two systems?—In the first place it is absolutely different and far more serious in every way. I think I have explained that in my book.

19,717. If you do not know Stock Exchange methods how can you explain it?—I have been in the commercial world and heard enough to know about it, but I have had no individual experience in it. I have talked

Mr. C. W. Smith. 10 May 1894.

to people and I have had that view of the difference confirmed by, I am told, some of the most leading men on the Stock Exchange. The greatest supporters of my views on these systems are members of the London Stock Exchange. I have been told that—if I have been told it once I have been told it by a dozen of men who have consulted Stock Exchange speculators. They have said, "Smith is perfectly right over that question of the difference between the Stock Exchange and the Produce Exchange." Personally, as I tell you, I have had no experience in gambling on the Stock Exchange, and I have never had a gambling transaction there in all my life. You see it is quite a different thing. There is only one stock of the London and North-western Railway, but there is a yearly stock growing of grain always all the year round.

19,718. What essential difference does that make when the dealing is in a definite article which can be carefully defined?—I told you the last time, and in my humble opinion I have given you evidence in this room to-day, that Germany and France are legislating against Stock Exchange gambling.

19,719. That is not an answer to my question. With reference to what you said just now about the London and North-western stock being always the same, is it not the case that the quantities available for delivery, the floating stock, as it were, continually differ from time to time?—Yes, but there are these contangos and backwardations—these carrying over. Such do not exist in produce. In the Stock Exchange, if I give a man an order, as far as I have always understood it, he can say, "I have sold you that stock," but he need not actually buy the stock; he books it to himself, does he not? There is a very interesting case that I have got here——

19,720. I do not think that bears upon my point. What I asked was, Is there not a variation, and often a very serious variation, in the quantities of floating stock in the different stocks in the market?—I presume there are variations. I made that very clear, I thought, last time.

19,721. That comes to the same thing as the variations in the quantity of grain harvested in one year compared with another and things of that kind?—Those quantities vary of course, but the thing is totally different from beginning to end.

19,722. Only you cannot tell us the difference?—I have published it in my book, I confirm that as my answer to you.

19,723. I have read your book and have not observed the difference, I cannot make out the difference?—May I read it to you again and explain?

Sales and re-sales of futures.

19,724. No, I think not. You used the phrase, for instance, that one contract to purchase is multiplied by sales and re-sales?—Yes.

19,725. Would it not be the case that the original contract to sell was also multiplied and formed the basis of a great many purchases and re-purchases, so that the one sets off the other?—You mean under the settlement system?

19,726 Yes?—Certainly, the majority are worked in under the Settlement System.

19,727. So that although it is an original purchase, if it is multiplied by sales and re-sales, that is completely set off by the original sale being multiplied by the purchase and re-purchases?—Of course every purchase must be re-sold and every man who has sold must buy back.

19,728. Then the two things are a complete set off to each other, and the tendency of the market is quite balanced by the speculative sales being set off against the speculative purchases?—Undoubtedly for every buyer, there is a seller—in every contract—no, there is a great difference, and I will tell you why. Because, if it was a bear sale—an absolutely bear sale without any actual foreign produce against it—that man would have to buy back again, but the man who sells futures against an importation of foreign produce as a hedge is not in the position of a legitimate bear, because he can, if he likes, tender the stuff, and is independent of a rise in futures, because he holds actual produce which covers him.

19,729. Then the ability to tender, the dealing in the real things has had a distinct and strong effect upon the market, is that what we have to infer?—What real things?

19,730. The man who can deliver the stuff is in a more commanding position than the man who cannot?—Undoubtedly he is in a more commanding position because in the event of a corner he has got the stuff.

Mr. C. W. Smith. 10 May 1894.

19,731. But he is not in a more commanding position than the man is who has got money to pay for the stuff on the other side?—Undoubtedly, and I am sure my evidence upon that point that I give you in the printed evidence of April 6 and in my books is overwhelming. I have supplemented one point by further evidence, and if you will allow me, I will read it. I think it is rather an important thing as I have shown all along, as far as I possibly can, that a bull cannot make money under the systems; I have given you the reasons, I have given you copies of the American evidence, which is the smartest evidence I have seen, and I have given you my own six questions and six answers which I have referred to. I do not think I have got very much evidence further if that does not convince you, except the actual fact. If you like to buy or sell, you will soon see at which you make money the first. I say in my printed memorandum of evidence, page 17, "You will notice "there are in all six questions and answers, and, "gentlemen, if you think it desirable, I will read them "now and amplify them verbally. For no one admits "more fully than I do the absolute importance of "proving the apparent conundrum, that, given an "equal number of sellers, and an equal number of "buyers, the former, in nine cases out of ten, get the "advantage of the latter." I quote you a variety of evidence in my printed evidence of April 6, backed up by the three publications which I have already written from this one point of view to show that it is impossible for any article to get up, and remain up, and if it does get up, there is a bigger panic than ever afterwards, owing to the fact that the basis of the rise was artificial and on paper, and hence rotten, and had to fall down again when the bulls unloaded, helped by the bears. However as regards these six questions and answers, I have written this out:—The following specially refers and is an addition to my answer to the third question of the series of the six, viz. How can you show that the future system would tend to keep prices lower than they otherwise would be in a year of scarcity? As already stated, the general public when speculating in futures invariably buy, say 999 out of every 1,000. The sellers of these contracts are those inside the produce exchanges. Now the speculative buyer of futures always wants an advance and is therefore a bull—he makes his profit by an advance. On the other hand, the seller wants a decline, and is necessarily a bear, he makes his profit by declines. Each side will exert all the power it possesses to move the market in the direction that will be favourable to its interest. The only question here, then, is as to which side possesses the most power or influence over the market. The buyers are individuals scattered all over the world, without organisation or communication, with no concert of action, no membership or influence in the various exchanges where the quotations originate, which rule the market and in most cases with very little capital in comparison to their operations. The sellers, the bears, on the other hand, are closely and thoroughly organised, consulting together hourly all members of the exchange where quotations originate, holding a commanding influence in those bodies where all the rules are made and committees appointed for governing the future systems, and possessing in many cases, especially in America, very large capital. It is plain therefore to see that these latter possess an overwhelming preponderance of influence over the quotation boards and the adjustment of prices.

The power of bears over bulls.

19,732. Then it comes to this that the seller, as a rule, is the stronger party inside the market operating against the public outside?—Yes, there is the blackboard; we are all inside this room; we do not care about the buyers; we are all short in this room; we are the sellers, and we make the quotations on the board.

Stock Exchange transactions.

19,733. Is that not a common case on the Stock Exchange also?—I am afraid it is also.

Effect upon prices.

19,734. Then how does it happen that on the Stock Exchange that system does not depress prices and that outside it does?—You have had serious examples enough of financial gambling. You had the Baring collapse; there was a depreciation of 200,000,000*l.* in America and Europe then; the members of the Stock Exchange were not ruined by it. Then you had the panic caused by the Anglo-Indian rupee legislation of 1893 a de-

Mr. C. W. Smith.

10 May 1894.

preciation of 72,000,000*l.* on the London Stock Exchange alone. I think those who had money invested know something of the power of the bears on the Stock Exchange when they have got anything to help them; they can save their financial necks by selling short and knocking down my property, which I consider criminal; they save their necks, and I am the loser and I am sorry to say that I speak most feelingly on the subject.

19,735. Still that is a case of a certain inflation of prices being taken out of them; is it not more so than anything else?—No, I say that it is not that, because since that financial panic which we had repeated after the Baring collapse in London on the Anglo-Indian legislation the other day prices have not recovered—they have recovered somewhat I do admit, but they have not recovered to anything like the extent to which they fell. I make a great difference—and I made a great difference in my last cross-examination—between sound securities and rotten securities. I say the action of the bears in the Stock Exchange transactions in London ought to be stopped.

19,736. I am not defending the Stock Exchange transactions; I am merely inquiring what is the particular effect of certain transactions?—There is no doubt about it, their power on the Stock Exchange is immense.

19,737. Still you cannot say, as a rule, that the system of speculation on the Stock Exchange keeps prices lower than they otherwise would be?—I should think it would do in doubtful securities. We will take now the South American securities — in fact what securities you like. If anything happens in the world to affect a certain security, to touch a certain security or to hurt it in any way. Yes, the Stock Exchange is a seller of that security at once, because they know the moment there is a sort of panic in that security the majority of people who may have bought it for a temporary investment or who get frightened will wire "Sell." Therefore they have great power.

19,738. The expert opinion rather is on the whole that even in these doubtful securities the system on the Stock Exchange keeps prices rather from fluctuating and keeps them rather above what they would otherwise be than below?—I consider in absolute sound securities it does without a doubt.

19,739. Even in doubtful securities?—In my last cross-examination I specially dwelt upon consols as an example. We have had that most solemnly proved since 1890.

19,740. You do not look at the whole experience upon the Stock Exchange and upon other speculative matters?—I condemn it exceedingly.

19,741. I am not defending it, I am merely inquiring as to this particular point, whether a system of speculation tends to keep up prices or tends to depress them and if it depresses them, how much?—I will tell you what I have seen; I have seen this in Liverpool, I have seen there great depression in the cotton market; I have seen the stock brokers round the cotton brokers like bees. They know perfectly well I am not a speculator on the Stock Exchange, and I never have been. I have said to several of them "What on earth "are all you fellows doing here"? "Doing here! "Why? You are causing tremendous depreciation in "our market; everybody on the Liverpool Exchange is "selling Stock Exchange securities to pay gambling "differences in cotton; that is what we are here for, if "you want to know. You must raise the money; if "you have not got the money you are declared to be a "defaulter." If that has happened once—I give you my experience—it has happened six times in the last 10 years. I have seen that with my own eyes. Therefore one depression of trade does re-act upon another, and if you are pressed for money for any differences or for anything else you must sell your securities on the Stock Exchange if your money is invested in that way.

19,742. That is quite true, but that hardly bears on the question that I put to you I think?—You asked me whether I think it is a cause of depressing prices on the Stock Exchange as a general rule.

Daily settlement in the grain market.

19,743. I asked you whether the system of speculation on the Stock Exchange has the same effect in depressing prices as a general rule as the system of speculation in the grain market which you have described?—That I have told you distinctly not. I have told you they are absolutely different. I consider that the speculation in the grain markets of the world being a daily settlement is absolutely worse than any other speculation, and I dwell in my printed evidence very strongly on that.

Mr. C. W. Smith.

10 May 1894

19,744. Then is the daily settlement, the distinguishing thing?—Undoubtedly it is one. On the Stock Exchange it is a fortnightly settlement as a general rule; in cotton it is weekly. If you harass me by telegraphing every day "Remit me 50*l.*, remit me 40*l.*, remit me 100*l.*, remit me 200*l.*"

19,745. Do you not get the system of daily settlements on the New York Stock Exchange?—You can see the effect of it I should think in the last two or three years.

19,746. But the prices on the New York Stock Exchange in the same securities vary exactly as they vary on any other Stock Exchange, do they not?—I do not know anything about the New York Stock Exchange, but I should think men of the Jay Gould stamp have been a very great curse to millions of people—and there are many of that class of men there.

19,747. I think that is hardly the question?—I think I must disagree with you, if you will allow me. I consider those men by being bears have ruined millions of people by these operations.

Stock Exchange transactions. Effect on prices.

19,748. My question is not whether people are ruined by Stock Exchange and other gambling operations, but whether as a matter of fact the system of gambling tends to depress the price on the Stock Exchange or not?—In this country?

19,749. Or on any other Stock Exchange?—Undoubtedly; that is my humble opinion.

19,750. I thought you told us a little time ago that it did not?—I say not so much in sound securities as in rotten ones.

19,751. I thought you said that as a rule it did not depress prices at all?—No, I have never said such a thing; I condemn them most tremendously.

19,752. Then is the price of rotten securities on the Stock Exchange as a rule above or below what it ought to be?—I have got money invested in a variety of things as I tell you, and I have been a very heavy loser by these panics; I have felt it tremendously—nobody knows how much. It is a most unfortunate thing. Here is a man who has been a pessimist for 15 or 20 years of his life, who has never trusted his money in anybody's hands except his own in his own business?—I got very ill and had to leave business for a year—so I retired from the business and I had to invest in 1889 in a variety of securities. I invested all my capital and I was caught in the panic of 1890, and a nice sufferer I am by it. I know men that have largely sold short securities that I hold, and they have told me about it and said:—Why on earth did not you sell, Smith, too?" I said "I am not a speculator on the Stock Exchange."

19,753. If a security was rotten ——?—It was a sound one when I bought it.

19,754. If a security is rotten is not any price above zero too high a price?—The South American securities which I bought were absolutely solvent if it had not been for Barings. You must go back to the cause of all these panics. It is the curse of the Continent and the curse of London, no doubt, is this gambling which predominates over every single class of person now.

19,755. Still the prices of rubbish on the Stock Exchange are usually above what they ought to be?—It is not rubbish until you have these financial panics. I did not invest in rubbish. I invested on the very best judgment of the biggest South American merchants in Liverpool of the highest standing, and they were perfectly petrified when the panic took place six months after I invested.

19,756. They turned out to be mistaken?—They did not know the financial rottenness of Messrs. Baring Brothers, which was a disgrace to England I call it.

19,757. Have you followed the history of legislation to prevent speculation in past times?—I give you in my printed evidence of April 6 all the evidence that I can possibly get, viz., from 1216–1844; if you have read it, as I have no doubt you have.

Imports of foreign wheat and flour.

19,758. (*Sir Nigel Kingscote.*) Am I to understand from what you have told us that owing to these future notes neither you nor anybody else can tell the quantity of wheat that comes into the market or which is in the market at any specified time—I mean actually imported wheat?—You have asked me a question on which figures have been published since I was in this

Mr. C. W. Smith.
10 May 1894.

room last, and which is one of the points which I bring in for fresh evidence on the question of importations. In the printed evidence of April 6 I say on page 11:—"You will observe in the first place that I do not "agree with the popular notion that the value of "English wheat last year has fallen to 24*s.* 8*d.* under "natural causes, or as a direct consequence of foreign "competition in the shape of increased foreign impor-"tations." Since I was in this room last, Dornbusch, at the request of a large number of gentlemen interested in this question, has published the United Kingdom's wheat crops in quarters from 1881 to 1893, and also the nett imports of wheat and flour in quarters in the same years. That I have put in as additional evidence I have tendered to-day. But I think it is very important, now that you ask me that question, if you will allow me to read it to you. In 1881 the wheat crop was eight millions——

19,759. I want to confine myself to the foreign grain. I only want to know whether there is so much grain really in the market?—You mean imported into this country?

19,760. Yes?—I can give you the exact figures. In 1881 the nett imports of wheat and flour were 17,200,000 quarters; in 1882, 19,982,000 quarters; in 1883, 15,816,000 quarters; in 1884, 18,000,000 quarters; in 1885, 15,210,000 quarters; in 1886, 18,356,000 quarters; in 1887, 17,676,000 quarters; in 1888, 18,873,000 quarters; in 1889, 19,093,000 quarters; in 1890, 20,784,000 quarters; in 1891, 22,295,000 quarters; in 1892, 22,264,000 quarters; and in 1893, 21,571,000 quarters.

19,761. How are those figures obtained?—They were published by Dornbusch about three weeks ago. He is an authority.

19,762. Has that information been available for people in the corn trade at Liverpool from year to year, or has it only just come out?—I think there had been published no absolute table so perfectly prepared as regards wheat crops of the United Kingdom and the nett imports of foreign wheat and flour into this country till Dornbusch published this.

19,763. Supposing that those reports were published regularly, would they in some way regulate these future notes, or rather regulate what you might call gambling or speculation in those notes?—Now you ask me another question, and if you will allow me, as it will only take two minutes to read it, I should like to deduct certain facts from these figures which I have read to you. In 1881 and 1882 the nett imports of foreign wheat and flour, plus the wheat crop of the United Kingdom, averaged 28,000,000 quarters, and the average price was 45*s.* 2*d.* From 1883 to 1888 the average tumbled down to 26,500,000, and from 1889 to 1893 it was 29,000,000 quarters. The average price fell from 45*s.* 2*d.* in 1881 and 1882 to 34*s.* 3*d.* from 1883 to 1888, and to 31*s.* from 1889 to 1893. Now I deduct this inference from that: by the above it will be noticed that during 1881 and 1882, say prior to the invention of the systems, the total quantity of wheat and flour for the United Kingdom averaged 28,000,000 quarters, with an average price of 45*s.* 2*d.* From 1883 to 1888, say when the systems were introduced as the basis for importation, but prior to a registered Settlement House, the total quantity averaged 26,500,000 quarters, or 5 per cent. less than 1881 and 1882, while the average price shows 24 per cent. decline in comparison with those years.

The supply of wheat and flour, and prices.

19,764. Can you tell me how Dornbusch obtained his figures?—He is one of the statisticians we have to depend upon in this country for these figures. They are acknowledged, as far as they possibly can be, as correct figures.

19,765. Are those figures figures which are obtainable by the public?—I will with pleasure give you the paper they were published in, which gives full particulars. This (*handing in circular*) is the original.

19,766. Where is this published?—It is published in London.

19,767. Could this Commission get those figures?—Yes; George Dornbusch sent it to me, "With the editor's compliments," the other day, when he published it. Anybody can get it.

19,768. But you have no knowledge how he obtained the information?—No, I have no knowledge of it. I am not a wheat statistician myself.

19,769. You do not know whether anybody else could obtain the figures. They are not obtained from the grain market, are they?—He is one of the recognised authorities on statistics of the grain market. It is like the Board of Trade figures—there must be somebody whose business it is to watch these figures.

Mr. C. W. Smith.
10 May 1894.

19,770. What you have told us now is what I may call after-information, and is not available to-day or to-morrow in the market at Liverpool or anywhere else?—No doubt everybody in London and Liverpool in the trade has seen these figures.

19,771. Would they affect prices?—Prices have been going down ever since.

19,772. Then do you think the compilation of these figures has helped to do that?—No; this circular was written at the instigation of a number of gentlemen most interested in the question. Because everybody you meet says there is an enormous increase in the foreign importations. But just let me finish this, and then you will see what the absolute deduction is. From 1889 to 1893, say the period since registered Settlement Houses have been in existence combined with rampant gambling, the total quantity averaged 29,000,000 quarters, or only 3½ per cent. in excess of 1881–82, while the average price shows 31 per cent. decline in comparison with those years. Therefore, taking into consideration the yearly increasing population, the United Kingdom has had combined less home and foreign and wheat and flour to contend with from 1883 to 1893 than existed in 1881 and 1882, and yet prices show a gradual decline, resulting in one of over 40 per cent. in 1894 in comparison with 1881, and this in the face of an increase in the population in the former year in comparison with the latter of fully 3,400,000, which at six bushels per head (including seed) means an increased consumption of no less than fully 2,500,000 quarters. These figures have been published to show that there is no increasing quantity taking the increase of population into account from 1881 to 1894.

Population and consumption.

19,773. I suppose there are no means of obtaining information as to the quantity of grain or other matter which these future notes cover?—No; I think I have passed over to Mr. Giffen the published statements as far as the Liverpool Corn Exchange is concerned, but independent of that, as I explained to him, there are a large number of contracts made which are not registered and not reported; nobody knows anything about those contracts.

Amount of grain covered by futures.

19,774. There is no register?—There is no register at all.

19,775. (*Mr. Whitehead.*) I think you suggest that there should be legislation to prevent this gambling in futures and options?—I think I have dealt in "Commercial Gambling" with an Anti-Future Bill for England.

Suggested legislation.

19,776. What form should that legislation take in your opinion?—It should be on very similar principles as the American Bills. I give you the whole working of it in "Commercial Gambling."

19,777. You mean, shortly, that it should be penal to deal in futures and options?—In this book I do not go so strong as that, because I recognise that it is an absolute necessity for England to be fed by foreign wheat. Until England grows wheat again it is too serious a question to think of making it penal when we are dependent upon foreign grain.

19,778. How would you propose to stay it, short of making it penal?—I would do it very similarly as I suggest in this book. It took me a long time to work it out, and I tried, as far as I possibly could, so that injury would be done to nobody interested in the *bonâ fide* trade of the country; that everybody should be protected under the systems. I do not go so far as America does. That is to say, I would not treat the very fact of dealing in futures and options as a misdemeanour, that is sponging it out entirely. But I would prohibit it to the extent by putting such strong taxes on it as to make a man think twice before he pays a big license to deal in it. Further than that, I have never wished to stop all speculative transactions. I do not wish the "bull" to be stopped at all. The essence of commercial life, in my opinion—the basis of all commerce—is speculative action. As far as this country is concerned, I would have a law that if a man does buy a shipment of Indian wheat, if he does buy a shipment of Californian wheat, or of American red wheat, or Argentine wheat in the month of May, and

Mr. C. W. Smith. 10 May 1894.

sells against it a shipment or future for the month of September, that wheat should be tendered and go against that one contract. That would limit the number of future sales in connexion with that purchase in the first place.

19,779. That there should be no subsequent dealing, in fact?—I would not say that. I would let that contract be turned over, but I would forbid that man who did sell that original contract to turn that one operation in 100 tons of foreign wheat into 10 or 20 operations in the Liverpool future market or the London market either. I would make him tender that. I would allow that one contract to be re-sold over, because that is legitimate speculation. If you would limit it in that way the surplus crops of the world would only have one chance of being turned over, and that would stop the 10 or 20 times operation, that would stop the bear—make that penal if you like—he could not sell. I have been a bear all my life. You would stop my chance. You would stop your cornerers, your manipulators, your hundred and one men—they are called by different names—all those gambling bear-sales and such illegitimate operators would be stopped. But they are infinitesimal in number as regards the population of the world; you can count them all up in a few hundreds, or at any rate in a few thousands.

19,780. You told us that the present law is sufficient to check gambling on the Stock Exchange; would not the same law be sufficient to stop the gambling at the point to which you would limit it?—No; I have tried to show you that it is only in the last two or three cases that I have seen where the Gaming Act of 1892 has at last been partly recognised in our courts as a means of stopping it. The verdicts in all the previous cases which I have quoted—and I give two principal cases in my book, and other cases have occurred—clearly show that the law of England has no power at all over these gambling operations; the courts do not acknowledge them as coming under the gambling system and the Gaming Act of 1892.

19,781. Then you would not propose to make it penal with regard to sales for forward delivery, I take it. You would not include that?—No; I do not go as far as that, because I would not do anything in these systems which would hurt any legitimate trade. I look upon bull speculation, and speculation in the commercial world as legitimate; I want to protect legitimate traders and producers, and the bulls of these paper contracts. Therefore I would allow the options and futures to be dealt with and the re-sales of these contracts, because, do you not see, if you could insist under a law that actual wheat, and actual cotton, and actual sugar had to be tendered against every one of those contracts the speculator would virtually be dealing in actual stuff, and there is no harm in that, for in that case there would then only be one surplus to deal with.

19,782. Have you seen the last issue of the "Corn and Produce Gazette," in which it is stated that options or futures in the corn trade in London are of small account—in fact, of no account?—No, I have not; but I believe that is perfectly true.

19,783. It is perfectly true?—I believe that what I call the most important people in London, as far as I have been able to find out, are dead against these systems and operations. They are only carried on by a few.

Options and futures in the London Clearing House.

19,784. It does not apply to London then, but only to the Liverpool market?—Yes, it does apply to London people and London. I will tell you why it does apply to London. You must remember there is the London Produce Clearing House, which deals in futures of Indian wheat. There you have absolutely options and futures under the system. There is another place called the Baltic, where there is an enormous gamble done, but it is not done in options and futures, which are deliveries; it is done in shipments. I have sold myself not shipments of wheat, but I have sold myself in years gone by in one season 20,000, and 30,000, and 40,000 bales of shipment of Indian cotton, and have never had a bale on hand, but I have turned every bale of them into speculation as a bear.

19,785. In London there is no system of options and futures, but there is another system which is equally bad?—Undoubtedly, and which is applicable to Indian wheat. I can assure you that it is very hard indeed for me to get any evidence lately. I am absolutely tabooed, although I was amongst them yesterday getting what information I could. I believe in the Baltic futures are traded in, but not under the rules of the London Produce Clearing House; that is a distinct thing. Anybody can sell in the Baltic as much as ever they like of Indian wheat, although you need never ship an ounce against it. The whole thing may be turned into a speculation. I have done it myself in other produce as explained.

Mr. C. W. Smith. 10 May 1894.

19,786. Do you accept the statement in this "Corn and Produce Gazette" that options and futures are of small account—in fact, of no account in London?—I would not go so far as to say that.

19,787. What proportion does the corn trade of London bear to that of Liverpool?—It is large.

19,788. As large would it be?—No, I do not suppose it is quite as large. It deals in different classes of wheat; it is principally Indian wheat London goes in for I believe.

19,789. Do you agree with this statement, that there is no such thing as futures and options in the London market?—The Liverpool market is considerably larger as regards futures than our London market. But may I just say one thing? You must remember that with the existence of the systems in Liverpool, it does not matter if you are in London—in fact, my business for the last 20 years has been for London people. I have operated largely for London people; I had very few Liverpool clients. These systems are made use of by people residing in London; it does not matter to me whether you are in London or Birmingham, or any part of England you like, as long as those systems are in existence it does not matter where you live, a 6*d.* wire reaches you and they can operate. They are not Liverpool people that operate alone—Liverpool people are not the only ones—they are very largely used by people from the country in different places. Then again in the London Produce Clearing House, look at the way that it works. It is a small business, for example, they argue. My answer to that is, gentlemen, if they say that it is a small business done in Calcutta wheat in the London Produce Clearing House, why do they publish every morning for the sake of the world those quotations, which are the ruling quotations of Calcutta wheat, all over the world, as quoted in the London Produce Clearing House? Why not erase them altogether? What is the use of having a system in London, unless that system is used? What is it used for?

The effect on the producer by the systems.

19,790. I will only ask you one more question; I may be very ignorant, but I fail to see how dealings continuously, such as you have described in the systems of options and futures, in an article whose quantity is indefinite, and must be affected by all kinds of circumstances, such as weather, &c., can be affected in its ultimate value to the producer of it?—We regulate, combined with America, the price for the producer all over the world.

19,791. How can your system effect that?—By causing a depreciation in the values of the articles it naturally affects the farmers all over the world. If you are a farmer in America, Argentine, or Russia—anywhere you like—and I am an importer in London, I am guided not by what you want, I am guided absolutely by the price in the market value of options and futures as ruling in this country or in America.

19,792. The question of supply and demand is of no value in such a case?—Absolutely none. I will qualify that if you like. If the world gave us a famine next year prices would run up, of course; but will you allow me, as you have asked me the question, to read you what has been written by almost the largest wheat importer of England on this particular question that you have asked.

Effect of the systems on prices.

19,793. I will not trouble you further. Your last answer is quite sufficient?—Very well.

19,794. (*Mr. Clay.*) Your great contention, as I understand it, is, that gambling in options and futures has lowered the price of wheat considerably to the farmer?—Undoubtedly.

19,795. Then you have no faith in supply and demand?—No.

19,796. Wheat is coming from California just now to the south of Scotland. There is neither speculation nor options, nor one thing and another of that sort there, but the wheat sells just now at 25*s.* a quarter, because there is no more demand for it; as I say, there is no gambling in this business there. Now how do you account for that?—Gamble where?

Mr. C. W. Smith.
10 May 1894.

19,797. There is no gambling amongst the millers buying that wheat from California at 23*s.* a quarter, and options do not come in to disturb that price?—Yes it do, it regulates the price. You are talking of a miller buying?

19,798. Yes?—The miller is as well posted to-day in the question of options and futures in the wholesale markets of London and Liverpool as anybody else, and if he buys his buying price is regulated by the price of these options and futures. He does not give more money than he can buy at home at. If he can buy cheaper in the wholesale market—that is, in the cargo market, or in the home market—he buys, naturally, in the home market; he does not import for the sake of importing foreign wheat. His buying price is regulated by the buying price of the wholesale markets—by options and futures, and the seller is also regulated by them.

19,799. Does the natural law of supply and demand not regulate the price of wheat in these localities where there is neither options nor gambling?—No.

19,800. How does it happen that the millers and the merchants in the south-east of Scotland, which I am talking of now, can get the wheat at that price. They have more wheat just now on their hands than they can consume and sell, therefore they can regulate the price, can they not?—That is a local market.

19,801. No; that wheat comes from California?—Do you mean the price in Scotland in the local markets?

19,802. Yes?—That is a local market. There may be a difference of a few pence, we will say, but I am talking on the broad basis of the world; as a rule, that one market may be a bit higher than another I fully admit.

19,803. You have quoted Liverpool so often that I quote Edinburgh and Leith, two very large importing places for Californian and other kinds of wheat, they are laden with wheat. There is no options or gambling there to interfere with the price, and the price is left to the legitimate law of supply and demand?—That is simply a local market, but if you were to ask those men to-day what is the price of wheat they would say at once, "What is the price in Liverpool or London?"

19,804. It is the quantity they have to face that they can buy so cheaply—there is so much wheat forced upon them, more than they can consume?—That is a local question. As for the world's supplies, futures and options regulate the price of wheat. I think I gave you, as far as I possibly could, the statistics of the world's supply given by Wood Davis and by Beerbohm; and in the book published by the Sub-Committee of the American Senate, I was very glad to see that they confirmed me on those points, that over-production in America or over-production on behalf of the world does not account for the enormous depreciation in the values of wheat.

19,805. But these people are not buying upon your gambling process, nor are they interfered with by it?—May I ask how you know that? The sellers may be hedged by futures in America or England?

19,806. Several millers have told me: large millers in Leith and round about the east coast?—Do you know as a fact that they are not?

19,807. I know what they are paying for Californian wheat?—Yes, but how do you know that they are not? Is this wheat bought by millers?

19,808. It is bought by millers to consume, to make into flour for bread?—How do you know that they have not sold a hedge against it; how do you know that they have not sold an option of flour against it? It is enormously done in this country.

19,809. The people have told me themselves that they have bought the article and got it delivered?—Did you ask them whether they had got a hedge against it or not—either a wheat hedge or a flour hedge. That is what I want to get at.

19,810. They told me the plain true facts?—I know; as far as they bought the wheat that is quite right, and that is the basis upon which all this business is being done, but it does not follow that because a man says he is not gambling that he is not. He may save himself; he may have a hedge out, an option hedge; that is done enormously; or he may have in the Liverpool or the London market entered into a speculative transaction as a hedge against these purchases.

Mr. C. W. Smith.
10 May 1894.

19,811. I say let us be thankful that in our country we do not know these things which you say you are so well acquainted with?—I am not so certain of that, Glasgow knows a great deal about these gambling systems from my own experience.

19,812. The wheat is sold to the millers and they have got it delivered?—I am perfectly well aware that there is lots of business of a *bonâ fide* character done; but look at the losses of the men who have been buying it or importing it without a hedge the past few years. The systems have ruined the buyers. They are ignorant of the workings of them.

Supply and demand *versus* the systems.

19,813. We have understood that the supply and demand for an article make the price, but now you say it is all options?—Supply and demand have got very little to do with it, if anything at all, as I have said. If you want to read anything about supply and demand you ought to get the "Liverpool Daily Post" for the past two years and read it every day; you would find there they have been prognosticating a rise every day. Their view is based upon supply and demand. I can produce my weekly circulars, which go all over the world. I have been prognosticating a heavy fall, a continual fall, my view being based upon options and futures. One is the "Liverpool Daily Post," the other is my private circular. I say, who is right? Mind you, they have been correct in the supply point of view, both about cotton and about wheat, that is the funniest part of it.

19,813*a*. I would rather believe in Adam Smith than the "Liverpool Daily Post."

19,814. (*Mr. Lambert.*) Are both of you correct?—They in statistics. I based my views, as I have done for years, on options and futures, I have been right in prices, they have been right in statistics and wrong about prices.

Settlement of differences.

19,815. (*Mr. Gilmour.*) I want to understand clearly about the payments of these differences on futures. Do these payments take place every day; am I to understand that?—I believe so, every day; that is to say, they can call on you every day.

19,816. Whatever price is fixed at the making of the bargain these differences do not at all affect the finishing of that contract; that is to say, the price paid at the end say of a September delivery for a bargain made in July has nothing at all to do with these differences between the two times?—The price of the contract between the buyer and the seller has got nothing to do with it; the value is fixed every day by what they call a Call Committee, composed of 6 or 8 or 10 men and it is put on a blackboard and that regulates the price for the day. If it is below the price that you bought at, you pay; that goes on at every call.

19,817. Then are these calls at certain hours of the day?—Yes, at fixed hours; that is, as regards wheat; cotton is weekly; and the Stock Exchange is fortnightly as I have stated.

Bears and bulls.

19,818. At Questions 15,662-3, in answer to a question by Mr. Giffen, you say, "There is no buying "power left in this country; there is no buying power "left in America; but it is compulsory on the importer, "or bear, to sell, and under these circumstances the "price must go down. The buying power in its pre-"sent condition cannot arrest the bear from selling, "because the bear has to sell because he has bought "abroad, unless he wishes to lose a great deal of "money." That compulsion of course will be a financial one, and that affects these bears alone, does it not?—You have hit upon the very nutshell of the whole position of America and England to-day. The bull speculators in America and England have lost so much money in various articles of produce since 1890—that I can tell you from personal experience in my late firm with this speculative business—that the buying power of the bull has absolutely almost ceased to exist. On the other hand, the man who keeps on importing must sell, and in the absence of bulls or speculative buying, read the New York papers every day, and read the Liverpool papers every day, in the absence of speculative buying power the market weakens and there is a daily decline. You have hit the very point of the whole position. That has been going on and gradually getting worse and worse until it has absolutely culminated, so that the speculative business in Liverpool to-day, and in London, is absolutely dead almost. On the other hand, the other man has to sell because he has bought foreign produce for importation. Likewise the professional bear can sell too.

Mr. C. W. Smith.
10 May 1894.

19,819. But these bulls will hold for a rise?—If you had been a bull for the last five years, you would either have been a ruined man or you would have been heart-broken under the settlement system.

19,820. How is this breed of bulls kept up?—On the same principle that although men lose money on the turf, every year a man comes of age who thinks he knows more than his father, and has a plunge. Another reason is that people say, "Well, it has gone down so "low, surely it cannot go any lower." In my opinion there is no bottom price as long as these options and futures are in existence.

Imports of wheat and flour statistics.

19,821. (*Mr. Little.*) You quoted some figures from Dornbusch, but there are official figures available, are there not?—The figures I quoted to you are given by Wood Davis on the one hand, and Beerbohm and Dornbusch on the other, but I believe that I am perfectly right in saying—indeed I believe it is the fact—that Beerbohm has corrected his world's supplies figures, making the small deficiency into a small surplus as compared with the two years I gave you. But I have got in this report to the American Senate the figures for 10 years, which confirm my views practically.

19,822. Sir Nigel Kingscote asked you if there were official figures from which could be ascertained the actual imports of flour and wheat; there are official returns, are there not, quite independent of Dornbusch?—I believe there are.

19,823. I have them here in the agricultural returns for five years, and they are a continuation of a series which has been published for many years?—I dare say. I have been out of the business for so many years that I have had to work up this evidence, and get all the information I can in the best way available. Perhaps Dornbusch has taken his figures from the actual returns; I have no doubt he has, but I am not aware of it myself. [The witness subsequently wrote as follows:—I have since ascertained by letter from the editor of Dornbusch that the net imports, as given in the Appendix in his issue of 16th March, and which I have quoted in evidence, are official, and taken from the Board of Trade returns, and represent receipts in cereal years, *i.e.*, 1st September to 31st August. Likewise the gross imports for calendar years, as given in the same issue.]

19,824. Then I understood you to give in answer to Sir Nigel Kingscote figures which seem to show that the decreased price of wheat was not due to an increased supply?—Quite right.

19,825. That that decreased price was produced by a system of gambling, and not by an increase in the quantity to be sold?—Quite right.

19,826. Are you sure that those are figures which can be depended upon?—What figures?

19,827. The figures which you gave showing that there has not been an increase of the supply?—I have given you Dornbusch's figures. Do you mean an increase of the world's supplies?

19,828. Of the English supply?—The only figures I have are those which have been published by Dornbusch, and I believe they are correct.

19,829. I was rather speaking of the supply for Great Britain, not of the world's supplies?—I believe the figures which I read to Sir Nigel Kingscote just now are the only figures available. They were published on 16th March, and I believe they are taken as authentic.

Supply of wheat and flour.

19,830. I have before me a statement of the available supply from home produce, and from net imports into this country for the last four years for each quarter compiled from official returns; that statement shows an excess of supply over the estimated consumption for every year, and an accumulation of supply; of course if there was an increasing surplus year after year there would after a series of years be a very considerable increase of the supply?—Yes.

19,831. That would be against the argument that you have been using, would it not?—No, not necessarily so, taking the reduced price into consideration.

Population and consumption.

19,832. I thought you said that there had not been an increase in the supply, and that therefore the fall in price could not be due to that?—My statement was based on a comparison with the demand from the increase of population between 1881 and 1894, which I have made out is equal to fully 2,500,000 quarters, according to Sir John Lawes and other such authorities.

19,833. The estimate which I have before me takes into account the population for each year, and the estimated consumption based on the same proportion every year; do you think it is at all probable that the consumption has decreased?—That is quite possible, because we are all becoming poorer, there is no doubt about it, for we all economise. But on the other hand, there is a very large farmer, for instance, who lives near me, I had a very interesting conversation with him coming up to London the other day, and he told me that he is feeding cattle, &c. very largely now upon wheat. He is a very well-known man in the agricultural world, so that a decrease would be set off by such an increase in cattle consumption.

Mr. C. W. Smith
10 May 1894.

19,834. That consumption would be by human beings?—That is for feeding. As far as the consumption by human people is concerned. I have never thought seriously on that point; but as you have asked me the question I could answer it off-hand that I should be afraid it is very probable that hard times are making a great difference to a great many people as regards consumption, yet low prices generally mean increased consumption and increased waste.

19,835. Do you know that Sir James Caird some years ago pointed out that amongst the labouring classes bread was much less depended upon for their sustenance than it used to be, and that they consumed more meat and more of other articles, and depended much less upon bread?—I was not aware of that.

19,836. It is a possible circumstance that the average consumption per head of wheat may decrease not only from the poverty of the people, but also owing to the substitution of other articles?—Well, I do not like to go against such an authority as you mention, but I should doubt it very considerably. But I may state that my estimated increase of population for 1881–1882, in comparison to 1893–1894, is based on the figures of such an authority as Sir John Lawes; also my estimated consumption of wheat (including seed) per head.

Imports of wheat and flour statistics.

19,837. (*Mr. Dalton.*) These figures that you have given from Dornbusch show a very large increase in the imported wheat in the last three years, as compared with the three preceding years, do they not?—Yes, they do.

19,838. Does that not tend to corroborate what Mr. Little has said as regards there being an accumulation of corn in the country?—You must import more as the home growth decreases. According to the last agricultural returns published 10 days ago, the wheat crop of the United Kingdom has decreased some 3,000,000 quarters as compared with 1891.

19,839. Take the last six years; have you got the average of the English corn and the imported corn together for the first three years of that time, and also for the last three years?—I have got it here for the last five years. Taking the years 1889 to 1893, I make the annual average of the home-growth and imports to be 29,000,000 quarters.

19,840. Have you got the figures for each year?—Yes. In 1889 the total was 28,000,000 quarters, in 1890, 30,000,000 quarters, in 1891, 32,000,000 quarters, in 1892, 29,000,000 quarters, and in 1893, 28,000,000 quarters. That is, roughly speaking, what Dornbusch gives, and the average is 29,000,000 quarters.

19,841. In 1890 and 1891 you got a very large quantity?—Yes.

19,842. What has been the average of the preceding years?—From 1883 to 1888 the average was 26,500,000 quarters, and the average of 1881 and 1882 was 28,000,000 quarters.

19,843. The average is very much higher now than it was in those preceding years, even having regard to the increase in the population?—I make the average from 1889 to 1893 to be 29,000,000 quarters, which is only 3½ per cent. in excess of the average for 1881 and 1882, while the average price shows 31 per cent. decline.

19,844. I was not assuming that the fall in price had not exceeded the amount of the additional supply. But the additional supply has been very considerable, has it not?—I consider that any man who works upon figures alone must take most seriously into consideration the enormous depreciation in value, and present price with the past.

19,845. If you have got a large surplus, that may send the price down to a very much greater extent?—

Mr. C. W. Smith.

10 May 1894.

There is no large surplus. We had a considerably larger surplus in 1881 and 1882, taking the world's supplies. I am glad to say I am confirmed most thoroughly in this subject.

The world's supplies and prices

19,846. The supply of the English and foreign corn for the last few years is considerably higher than it has been in any preceding period, is it not?—In 1891 you must remember, which is only three years ago, you had a rise in wheat from 32*s.* 3*d.* to 41*s.* 8*d.*, with absolute scarcity and famine. Therefore, when you talk about the last few years, we know that when the world was in famine we had a tremendous rise in wheat in that very year, which was only three years ago. If anybody can show me that the world has been over-supplied since that period, I challenge him to do it.

Effect of the systems upon prices.

19,847. What do you consider regulates the price of futures and options from day to day, and hour to hour?—In what country?

19,848. In Liverpool?—Are you talking of wheat?

19,849. Yes?—Principally American quotations as they come in morning and night.

19,850. And what regulates those? I understand you to say that supply and demand have nothing whatever to do with the prices?—When I say nothing, I mean that it has hardly anything to do with them.

19,851. Then what does regulate the fall and the rise from day to day and hour to hour?—The operations of the bears principally and the re-sales of the bulls and manipulations.

19,852. And there is no limit to those operations?—Absolutely none in America as regards the bears.

The fall in the price of wheat.

19,853. Then why has the price of corn not fallen lower? According to your system I understand it is to the advantage of the speculators to send it down further and further regularly, and it has been so for a very considerable number of years; why has it not gone down further than 25*s.*? What has stopped it at that point?—Surely you do not want it to go to nothing all at once?

19,854. I am only asking what does stop it; something must stop it?—I think in my evidence I gave it to you that it is down 35 per cent. in America since last May. Is that not enough in 12 months—35 per cent.

19,855. Everybody, I understand, who speculates gains by sending it down?—To every seller there is a buyer, and the buyer loses distinctly by every fall in the market.

19,856. But the others are stronger than he is?—Quite right, they are under the systems as explained.

19,857. What is the countervailing influence which prevents it going down further than it does?—Give it time and you will see it down.

19,858. There must be some influence, I suppose, which checks the fall?—The market does not simply go down without a break, though it has gone down like that since 1891; there must be fluctuations.

19,859. What stops it?—The very men who are short like to take a turn in the market, and put it up, and then unload on the rise again.

19,860. You think supply and demand have nothing whatever to do with it?—Very little. If you will give me a small crop in 1894, and the world gets bull of options and futures all over the world, and I am the only bear in the country, I shall be the only man to make money eventually.

Classes of wheat affected.

19,861. I think you say these options and futures simply concern first-class wheat. They are simply contracts relating to first-class wheat?—They affect all wheat.

19,862. They are contracts to deliver first-class wheat. Do you consider that they regulate in any fixed ratio the market price of Indian wheat, and does the market price of Indian wheat always bear the same proportion to these prices of first-class wheat, or does it vary?—It has a large influence upon it. We will take for argument's sake the difference between Indian wheat and American wheat or Russian or Californian wheat. If you are an Indian merchant engaged in the trade in Indian wheat, if you are a buyer and go to India to import into this country, the basis of your operation is largely dependent upon the price of futures and upon the tone of the future market. For instance, if the tone of the future market was strongish, we will say, and you have got a firm offer from India, and you thought the market was going to harden, you would accept that offer; but if the future market was flat and in a panic, and in a state of depression, your operation would only be based on what you would consider would be a fair figure for the purchase of Indian wheat.

Mr. C. W. Smith.

10 May 1894.

19,863. Does the price of Indian wheat always bear the same proportion?—I do not say it does always. There may be very small fluctuations.

19,864. They would be only small fluctuations?—Yes, when I say small they do vary. There is an enormous manipulation in Indian wheat. I tried to impress that on the Commission just now. But it is done in shipments; it is not done in options and futures which are deliveries. But speculation is enormous in London and in the Baltic.

Effect of wheat production on speculators.

19,865. (*Mr. Lambert.*) Does the amount of wheat produced make any difference to the speculators?—That has really been the cause of ruin since 1890.

19,866. Does it?—Yes, I am going to tell you why.

19,867. I only want to know whether in your opinion it does or does not?—Yes, ignorantly so, because men go upon what they call the shortness of the crop. You had a short American crop last year; there was a very heavy deficiency; people then bought wheat largely on the strength of that, and, therefore, the poor bull had been caught, thinking that according to the laws of supply and demand, and according to the world's statistics, prices will go up. That is why they bought, and, therefore, it has a distinct influence on the operator who is a bull. They never calculated upon the effect on prices under the option and future system.

19,868. The amount of wheat produced does make a difference to the speculators, is that your contention?—I do not quite see in what way you mean to use the term speculators. Do you mean the amount of the operations?

19,869. The amount of operations conducted in speculation on wheat?—No, I think it makes but very little difference in the amount of operations.

19,870. Supposing that one-third of the cultivated area of wheat in the world were to be thrown out of cultivation, would that make any difference in price?—There is no doubt about that.

19,871. Then the laws of supply and demand would have something to do with it in that case?—If you put such a dreadful case before the world, which means starvation, bread riots, anarchism, and famine staring us all in the face, and if you told Liverpool plainly to-morrow that that was going to be the case, I would make my fortune in six months, if I knew it was a fact.

Effect of low prices on wheat production.

19,872. Supposing the price goes lower, do you think there would be so much wheat produced?—I can only tell you that on that question I hold the most serious views that it is absolutely solely and only the reduction in the price of wheat which has ruined this country.

19,873. One moment, I only just want you to answer this question, which is a very simple question; if wheat still goes lower in price, will there be so much produced?—No, most distinctly not; it is going to ruin the world.

19,874. If there is not so much wheat produced will the speculators be able to keep down the price?—They are keeping it down now quite irrespective of the supply.

Effect of low prices on the nation.

19,875. (*Captain Owen Thomas.*) Would you say it was a national blessing or calamity that the price of wheat should be so low at the present time?—A national calamity, and it is a calamity to the world.

19,876. How can you explain that; are we not consumers as well as producers?—Really, I should have to read to you the whole of my evidence from that point of view. I have given it to you in detail in the printed volume of my evidence of April 6. The producers of this country are our largest consumers; if you ruin the producers you ruin the great bulk of the consumers. I dwell upon that as far as I possibly can in the printed statement of evidence.

Cost of production.

19,877. I do not quite understand you on that point. Is it not the general rule for prices of different produce to be based on the cost of production, and guided, to a certain extent, by the law of supply and demand? I know you have been questioned already on this matter; but taking produce generally are the prices based to a certain extent on the cost of production, and guided by the supply and demand for the article?—As regards the farmers of the world, do you mean?

Mr. C. W. Smith.
10 May 1894.

19,878. Yes, take the farmers of the world?—Most distinctly not. I consider that the farmer has very little to say in the matter; he is entirely in the hands of gamblers, they make the prices for him.

19,879. Do you know at what price per quarter the English farmer can grow wheat?—I can only answer that question by saying that I have asked it of a hundred and one people, and they all tell me about the same, from 35*s.* to 40*s.*

19,880. Do you know at what price a farmer can grow his wheat?—That all depends on whether he is in a favoured nation as regards the exchange or the depreciation of silver, or whether he has to pay in a gold currency; there are a hundred and one things that affect the question. One nation may be considerably more favoured than another in some things. My theory is this, that it is wheat competing with wheat and not wheat *versus* silver or gold, and that is really a question of the price of wheat competing with the price of wheat.

19,881. Do you know what the present price of wheat is?—Of English wheat?

Price of English wheat.

19,882. Yes, foreign and English wheat, it is pretty nearly the same in each case?—I do not know, I have not followed it for the last fortnight. I think it is 24*s.* 8*d.* or 25*s.* 6*d.* for English wheat.

19,883. Would you say that is below the cost of production?—Of the English wheat?

19,884. I am speaking of wheat generally?—Through the world?

19,885. Yes, wheat generally?—Undoubtedly throughout the world.

19,886. Below the cost of production?—Throughout the world without doubt on an average.

Wheat growing in South America.

19,887. Are you not aware that the South Americans can deliver wheat in England at 22*s.* a quarter and make a profit?—An absolute profit on wheat?

19,888. Yes, absolute profit; I can give it you in print?—An absolute profit on wheat?

18,889. Yes; they can deliver it at 22*s.* per quarter after paying insurance, freight, and everything else?—Do you say the farmer does it?

19,890. He is a farmer, I suppose, in America as everywhere else?—Excuse me. I know from what I have read that you have had a great deal of evidence on this point, but I ignore the farmer under the systems. There is not one farmer in ten thousand who imports this wheat; it is done on commission; it is done by merchants on the basis of futures. The poor farmer grows it, I admit, in Argentine and in Russia, and everywhere else; but when he grows it he must export it, because his is an exporting country. I ignore the farmer in wheat.

19,891. But do you think the American farmer would grow wheat at a loss every year and send it over here?—He is bound to grow it. He has got expenses to meet; he has got his mortgage money to pay, and he is growing it at a most serious loss for the benefit of the Jew that he owes his mortgage money to. As far as the American farmers are concerned I have absolute proof of that. What is the cause of the ruin of this country? The country going out of cultivation; that is the ruin of this country. If we had to pay 8 per cent., or 10 per cent., or 12 per cent. on our land like the foreign farmers have, somebody would rue it. In this country it is the landowner principally, not the tenant, who rues it. If the estate is mortgaged the tenant has to work and the landowner has to pay the mortgage money. In America and Germany the landlord does the work himself, there are no tenants at all; they are their own landlords, there are no farmers in the same way that we have got farmers in this country, that is to say, farmers under a landlord.

19,892. What I say is, and I firmly believe it, that you can import wheat year from South America, and the farmer would be well paid out of it, for 22*s.* a quarter?—I do not believe it.

19,893. Well, of course, there we differ?—I know it is put forward, but I ignore the farmer entirely. If you were to produce here 10 corn merchants dealing with Argentine and ask them how much wheat is brought from Argentine into this country on behalf of the farmer I know what their answer will be. The poor farmer is being absolutely ruined by it; but he has to grow the wheat and he is dependent on the United Kingdom buyers who regulate his price for it must come into this country.

Mr. C. W. Smith.
10 May 1894.

19,894. How can those farmers go on losing if they are farming on borrowed capital? I think you will find that South American and American farmers have to borrow money at 10 per cent., 12 per cent., 15 per cent, and 18 per cent.?—They cannot go on if price depreciates much more.

The loss to the farmers of the world by depreciation in wheat.

19,895. How do they go on from one year to another?—I tell you I am absolutely certain—I have given the evidence as strongly as I can—that the depreciation caused by the systems, throughout America and England, in wheat has caused farmers throughout the world a loss of about 200,000,000*l.* below its lawful price; and I stick to it. That is the principal cause of agricultural depression all over the world.

19,896. There are more growers now in South America than there were three years ago; if it is a losing game every year one would suppose that you would see less?—I am quite aware that South America has been a most favoured nation as far as only the growers of wheat are concerned, but after all a further depreciation in prices will yet kill them. They have temporarily this great appreciation in gold to help them immensely. They live in a favoured country—I admit it—they are like the Indian ryot, the Indian grower has been favoured by the depreciation of silver, and he has not felt it. But it is only a matter of time to make every nation feel it. That is why Germany and France, and the United States of America, and Russia are doing what I am asking England to do, that is, recognising the system as a curse to their country. I quite admit that their stuff is being brought into this country by merchants, based on options or futures, but I totally give evidence against anyone of those importers of grain who will say that that wheat comes on behalf of a farmer. It is his ruin. The farmer has to sell it if he grows it. I have heard your argument used in the commercial world for 15 years. It will kill all farmers if it goes on. This enormous depreciation in values is killing them by degrees, and it is a most serious thing for the world, and the world will find it out in the next three or five years, when they will have to recognise these systems. The importers bring this stuff over on the basis of these systems sold in America or England, from every part of the world, and they do not do it on the farmers' account. I will not say for certain, but I do not believe that there is hardly a single transaction in London or in Liverpool on the farmers' account—it is bought from the poor fellows over there, as they have got to sell it at the best price possible.

19,897. Take Wales; we do not grow much wheat?—I know you do not.

Effect of low wheat prices on Wales.

19,898. It is therefore very much to our advantage I would say, to have wheat at low prices?—I dwelt upon that in my printed "Statement of Evidence" of April 6. I do not care if it is Wales or any other part of the country. I might look at the counties I have lived in. I have lived in two of the most favoured counties in England for the last 35 years, one Cheshire, and the other Herefordshire. They hardly know anything about agricultural depression, although the landlord knows about it, the tenant farmer hardly knows anything about it. I have told them, "You must look at "this agricultural question from a national point of "view, because if it does not hurt you yet, being a "grazing country, do not think you are going to "escape." And do not you think that North Wales is going to escape.

Depreciation in price of cattle.

19,899. How will it affect us?—Through cattle depreciation—look how cattle have been depreciated; look how it has hurt people in the last 12 months. Herefordshire acknowledged to me last year, I know most of the people there, and they talk to me on this subject, they acknowledged that they laughed two years ago at this question which I was going to bring forward, but they do not laugh now, because they have seen how any general depression in the commodities of the world does re-act upon every other commodity. Their capital was in what—in cattle, and oxen, and sheep, and they have found it out at last.

19,900. But there is no gambling going on in cattle.—No, but if there is general depreciation in one thing it re-acts upon another; it all goes together; only the last thing which is not gambled in is gradually affected. I know North Wales as well as you do. I have been there all my life, or on the borders of it, and I know perfectly well that you are favoured. But look at

Mr. C. W. Smith. 19 May 1894.

it in the broadest sense you can, as a national question; look at it as a question for the world, and the world is looking at it in that manner which I want you to look at it in—that is, from the broadest point of view—and you will see that this constant depreciation in cereals means ruin to the world.

19,901. Wheat is going down to-day, but cattle are going up. I know that in my part of the country they are 3*l.* a head more?—Quite right; so they are in my part of the country, much dearer. It is a natural recovery from panic values caused by general depreciation, as explained in my evidence.

Imports of wheat and flour and statistics.

19,902. (*Mr. Giffen.*) With regard to these figures that you quoted from Mr. Dornbusch with reference to the imports of wheat and flour into this country, are you aware that a few years ago some change was made by the Customs in converting flour into equivalent weights of grain?—No, I was not.

19,903. If you made the conversion in the years 1881 and 1882 with which you start here, that would reduce to some extent the supply which Mr. Dornbusch shows at the beginning of the period instead of being 28,000,000 quarters on the average of those two years, it might be only a little over 27,000,000 or something of that kind?—As I told you, I got those figures from Dornbusch and they have been acknowledged as correct since he published them.

19,904. You have not compared them with the official figures which you will find published, for instance, in the Statistical Abstract for the United Kingdom at pages 78 and 79, where these earlier figures have been rectified, so as to have the conversions made upon the same basis as apparently those figures which are taken for the later years?—No, I have not. Dornbusch sent me those figures; I wrote to him asking him for the last year's figures, and I took it for granted that the figures were, as far as I could see them, substantially correct.

19,905. Perhaps the supply has increased a little more than these figures seem to show?—No man in the world knows better about statistics than you do. Note how they keep on rectifying them in the American Board's Returns.

Mr. C. W. Smith. 19 May 1894.

19,906. This is rather an important matter, is it not; you convert the flour into quarters of wheat at a certain rate at one period, and then you convert it at another rate at another period; and if you take the figures in the rough, as it were, and you do not apply the same correction at different times you would have one result, but if you did apply the same correction you would have another result?—Yes, I have no doubt you know about it. I have never heard of it before. Is it a very big thing?

19,907. I do not like to go into detail, because I have not the time, but my impression is that it would make some difference?—It would make a difference, of course, but would it be a very big thing compared with 13 or 14 years ago, taking into account the enormous increase of consumption caused by the increase of population, which I make out is fully equal to 2,500,000 quarters. Would it change the figures so enormously? Is it a question of millions, or is it not a question of only half a million to a million.

19,908. Instead of 17,200,000 quarters, which was the import in 1881, and 19,982,000 quarters, which was the import in the following year, you might have to reduce those figures by something like 5 per cent.?—As much as that?

19,909. As much as that?—It is a question that I have never heard raised.

19,910. Would that affect your impression as to there being no increase of supply from the beginning of the period you have taken up to the end of the period?—It all depends what difference it makes. You have raised a question, and of course I can only go by Dornbusch's figures; I can only give them to you as the most reliable figures I have got in hand. I have been dependent, as I have explained all along, for my statistics and figures upon what I have been able to obtain from such sources.

The witness withdrew.

Mr. S. B. L. Druce.

Mr. Samuel Benjamin Large Druce called and examined.

Mr. S. B. L. Druce.

19,911. (*Viscount Cobham.*) You are prepared to give us information on the agricultural position, I believe?—Yes.

19,911*a*. Have you been connected with farming yourself?—I have been connected with farming all my life; my father was a farmer, both my grandfathers were farmers; I was bred upon a farm; I do not farm myself, but I have a small property in Oxfordshire which I let. Since 1876 I have been Secretary to the Farmers' Club in London, and I am still their secretary. I also practise as a conveyancer and chancery barrister, having Chambers in Lincoln's Inn. From 1879 to 1882, I was one of the Assistant Commissioners on the Duke of Richmond's Commission on Agriculture, and was entrusted to report on the 15 eastern and eastern midland counties in England. I wrote three reports for, and I gave evidence twice before that Commission, to all of which I beg leave to refer.

19,912. Are you fairly well acquainted with the midland counties, and other parts of England?—Yes, I think I may say that I am fairly well acquainted with the midland and eastern counties. I do not know very much about the west, or about the North of England, but from my position as Secretary of the Farmers' Club, at least once a month I meet men from all parts of England, and I constantly hear from them how things are going on in the agricultural world. Our members come, more or less, from all parts of England; more from the home counties than from greater distances; still, we have members from the North and the West.

Land tenure, freeholds and copyholds.

19,913. What is your opinion of the influence of our present system of land tenure upon agriculture generally?—If you refer to the ownership of land, I do not think it really makes any difference, from an agricultural point of view, whether land is held on freehold or copyhold tenure, or now-a-days whether it is settled or unsettled.

19,914. It is a matter of infinitely greater importance, I suppose, whether the landowner is comparatively unencumbered?—Certainly; assuming a landlord to be unencumbered, or not very heavily encumbered I think it makes very little difference whether he is owner in fee simple, or tenant for life or tenant in tail.

19,915. You have not seen any difference in the condition of copyhold properties as compared with freeholds?—No; I made careful inquiries on that point when I was about in 1879 to 1882, and I do not think it really makes any difference. As regards copyholds, I have come across cases of dissatisfaction where the fines are arbitrary, but that was not from an agricultural point of view, but from the point of view of the ordinary purchaser of land. So far as the tenant farmer is concerned, he rarely knows if his landlord is a freeholder or copyholder, and it does not matter to him a bit.

19,916. You do not think that it operates against the improvement of land that the fines are assessed upon the improved value?—I never came across a case in which it did so operate.

Land under settlement.

19,917. Now-a-days you would say it matters very little whether the land is under settlement or not?—I do not think it matters much now. In 1882, the Settled Land Act was passed, and it came into operation as you know in 1883, and has been of very great assistance; I find it to be so, as far as the agriculturists in this country are concerned, and I think it has put the landlords in a very much better position. The fact of their being able to spend capital moneys arising under the Act in permanent improvements has been a very material benefit. Then, also, there is the ease with which leases can be granted now by tenants for life.

19,918. Are leases practically taken advantage of now?—No, I am afraid not; there are very few agricultural leases.

19,919. It is only a theoretical advantage?—Only a theoretical advantage.

19,920. You might perhaps go so far as to say that a farmer would somewhat prefer to be on a settled estate than an unsettled estate, owing to the greater certainty of his position?—Yes, I actually came across

Mr. S. B. L. Druce.

10 May 1894.

cases of that sort. I remember one especially; I think it was in Bedfordshire; when I asked the farmer what would be the safest form of tenancy that he could have, he replied a tenancy on a large settled estate, and he gave me as his reason that such estates are generally the best managed, and that there is a uniformity of management, and a continuity that is very rarely broken.

19,921. Continuity of ownership as well as management?—Continuity of ownership in the same family, and continuity of management. From observations and inquiries which I made and answers that I had given to me in other places, I think I am correct in saying that that is a generally received opinion, and in my opinion a true one.

19,922. It depends to some extent upon the management being good, and upon the owner being in an independent financial position?—That is the point, and it is true that in the large settled estates the management is good, because, as a rule, you get a good class of agent; you get the best class and the best man.

Owners and occupiers.

19,923. You would say that the tenant farmers on the whole have the greatest advantages in the cultivation of their land as compared with occupying owners?—I think that the tenant farmer is in a better position as a farmer, regarding him simply as a farmer, than the occupying owner of land, for the simple reason, as it seems to me, that the landlord supplies a very large portion of the capital at a very low rate of interest, and that the farmer has the opportunity of putting out his capital at a much better rate in farming operations than he would if he purchased the land.

19,924. Do you think that the farming tenant is a necessary element in our present system?—I think the farming tenant is a necessary element. I think one of the best ways in which land can be managed and farmed to advantage is our English system of having an owner and an occupier who farms, the owner not giving himself up to the management of the farm and the manager of the farm, the farmer, not owning and not being trammelled with the ownership of the land.

19,925. Do you think that the agricultural crisis would have been infinitely more severe if it had fallen entirely upon a class of occupying owners?—Yes, I think that it would have been very much more severe. I think the landlords, as a rule, taking the country through, have met their tenants, and have shared the losses with them; the loss has been shared between the two instead of falling on one.

Leases.

19,926. Do you regret that the habit of taking leases has fallen so much into desuetude?—Yes, personally, I think that a lease of such a length as to enable a man to reap the full benefit of any money that he spends on his farm is the best form of tenancy. I think it is rather a misfortune, if not a great misfortune, that leases have fallen into such desuetude as they certainly have. At the same time there is much force in the farmer's objection to be tied for so great a length of time, and one has come across cases in which men have deliberately broken the covenants in leases, hoping and expecting that the landlords would take advantage of the right of re-entry and go in. But I need hardly say that the landlords did not do so; they passed over the breach.

19,927. Do you know of any cases where leases have been broken owing to the insolvency of the tenant. I suppose such cases are within your knowledge?—Yes.

Lord Tollemache's leases.

19,928. Do you approve of one-sided leases, such as Lord Tollemache's? He, I understand, gives a lease that operates against himself, but not against the tenant?—Yes, I have come across that, but I had forgotten it for a moment. I think that is rather Quixotic.

19,929. Those leases are given both in Suffolk and in Cheshire?—Yes, I think so. I remember that I called upon the late lord on the former Commission, and, I think, he told me so.

Lord Leicester leases.

19,930. How would you provide for the closing years of a lease?—I think Lord Leicester's plan is the best of all; that is to say, his leases were for 20 years, and at the end of the sixteenth year an arrangement was made either for a continuance or during the last four years the tenant was under an obligation to bring the land back into the Norfolk four-course system.

Notice to quit.

19,931. But failing a lease what notice should you provide?—I like the two years' notice on either side; I think that gives a man time to look about, and a twelve months' notice, if you cannot get the two years, is right.

Mr. S. B. L. Druce.

10 May 189

19,932. Would you not consider two years too long in the case of a tenant in difficulties; is it possible to keep such a man for two years?—You could not if the man was in difficulties. I found cases in which the farmers themselves preferred the six months' notice to either. I was rather astonished to find that. Those were Lincolnshire farmers; they had been accustomed to their six months' notice, and they preferred being under the six months' notice to a 12 months' notice. I am talking of the time before the Agricultural Holdings Act of 1883, which, as you know, makes the 12 months necessary instead of the old six months' notice. Before that time when one put the question to them, many of the Lincolnshire men told me, "I would much prefer the six "months' notice to anything else, because it is so much "more convenient for the tenant. If I want a change, "if I want to go, it is more convenient for me than in "the case of a longer notice. It is much more con- "venient, you can get rid of the farm much quicker."

19,933. Would he be sufficiently protected under the custom of the country?—Yes. Then you must remember too it makes a great deal of difference as to the time of the year when tenancies commence. The Lincolnshire tenancies are all Lady Day. I think the 12 months' notice and a Michaelmas tenancy is the best form.

19,934. (*Mr. Little.*) The 1883 Act allows a contract in writing for a tenancy with six months' notice?—Yes, it does, the 12 months is not compulsory.

19,935. You can contract out of the Act in that respect?—Yes, certainly.

19,936. (*Viscount Cobham.*) Should you say that in any other counties than Lincolnshire it would be safe for a tenant to accept a six months' notice only, an improving tenant, for instance?—If you ask me my opinion I would never recommend a tenant to do it.

19,937. At the same time that was the feeling in Lincolnshire?—It was absolutely the feeling in Lincolnshire.

19,938. Do you know any cases in which the landowners and tenants have agreed upon a six months' notice since the 1883 Act?—No, I cannot say for certain.

19,939. (*Mr. Little.*) Probably there would be a good many continuing agreements that were made before the Act was altered?—I have no doubt there are a great many still. I cannot remember a case at this moment.

Freedom of sale and cropping.

19,940. (*Viscount Cobham.*) What restrictions on cultivation would you say were expedient as between landlord and tenant?—I am one of those who think that the fewer the restrictions placed on the cultivation of the soil and the sale of produce the better. I think it is only fair that in these days the tenant farmer should have as free a hand as possible in farming his land and in the sale of produce. In my own little case I have given a tenant of the land my father left me a lease for 21 years, and I have let him do exactly what he likes.

19,941. You have not any deterioration of the land from the wholesale selling off of the straw?—In these cases there should always be a covenant to keep the farm and leave it in good heart and condition, and I hold that with that covenant the landlord is safeguarded, that he has a legal claim that can be enforced against the tenant at any time; and that such a covenant is not a hardship upon the tenant, because he is only undertaking to do that which he ought to do to the land. But, on the other hand, so long as he keeps the land clean and in good heart and condition he may sell and grow what he likes.

19,942. That would mean a great deal more thrown upon the agent; the tenant would have to be looked after very sharply if he habitually mowed and sold straw. Would not considerable damage be done in the course of years unless he were sharply looked after?—You must have some sort of confidence between the landlord and tenant. I do not think it is right to treat a tenant as a man who means to ruin the land and to make all he can out of it and hurt his landlord. I think you must consider that the tenant when he takes the farm intends to live there, and make a living there. I am taking the case of a good tenant, a fair ordinary tenant, not a wrecker, who takes the farm to

Mr. S. B. L. Druce.

10 May 1894.

wreck and then leave it—I do not allude to such men, who, in my opinion, are exceptional.

19,943. Should you say, generally speaking, that the land in the parts of England you are best acquainted with is in as good heart and condition as it was before 1879?—No, it is not.

19,944. Has that been partly owing to the relaxing of restrictions upon cultivation?—No, I do not think so; I think it has been owing to the want of money on the part of the farmers.

19,945. To want of capital?—Yes, I think the restriction against the sale of straw, for instance, is too common. I think it has been very hard indeed on men who have not been able to sell straw and hay during the last 12 months. I came across one or two cases only the other day when I was down in Oxfordshire in which tenants had kept going by being able to sell hay and straw.

19,946. That is very common, is it not, of late years?—Yes; I am very glad to say it is becoming common.

19,947. The restrictions have been a dead letter in most cases?—Yes, and that is really another reason against them; they are hardly ever put into operation. I will not say hardly ever, perhaps I am wrong in that, they are seldom put into operation except by a hard-hearted or ignorant landlord. They are put in agreements but they are really taken no notice of, and the tenant acts practically in contravention of them; no notice is taken of them at all.

19,948. (*Mr. Little.*) Except on a vacancy?—Except at the end.

19,949. (*Viscount Cobham.*) In the eastern counties it is not possible to sell straw because there is no market for it?—That is what I found. When I was on the Commission I remember hearing about it; I think it was when I was staying with Mr. Little, or in his neighbourhood. The farmers were not allowed to sell their straw, and if they had been allowed to sell it, they seemed to have no market for it; yet at the same time straw which had been imported from Holland was selling in Manchester. I remember it very well; it struck me at the time as being so very peculiar. There were great quantities of straw in the Fens, and yet straw from Holland was being sold in Manchester.

Tribunal for fixing rents.

19,950. Are you of opinion that there should be an outside authority for the fixing of rents?—No, most decidedly not; I think the landlord and tenant ought to settle that matter between them, and they are quite competent to do it. I have not such a bad opinion of English farmers as to think that they are not quite capable of getting their land as cheaply as possible, and I think that landlords can very well manage their own affairs, and get as much rent as possible.

19,951. Do you think the farmers as a rule are of the same opinion as yourself on that subject?—Yes, I do. There are very few farmers that I have ever come across who want any outside authority to settle rents between landlord and tenant.

19,952. Quite apart from the landlord you think it would not benefit the tenant?—I do not think it would benefit the tenant.

19,953. He would not have lower rents than he has at present?—I do not think it would benefit him at all. The authority would have to act, I take it, according to rules, and could not take into consideration the poverty of the tenant, or anything of that sort. He would have to exercise his discretion, so to say, in a judicial manner, and I very much question whether it would tend to the benefit or advantage of the farmers at all to have such an authority.

19,954. Are rents now paid entirely in cash in the eastern counties?—Yes, I think so.

19,955. Are there no cases of personal services?—There are a few; I have come across a few cases in Norfolk and elsewhere where the old-fashioned payments in services to be rendered to the landlord are still kept up, but on the whole, these are dying out.

The Agricultural Holdings Act. Claims and counter-claims.

19,956. In what direction do you think the Agricultural Holdings Act might well be amended?—I think the first point requiring amendment is the length of notice of claim. Section 7 of the Act reads, "A tenant claiming compensation under this Act "shall, two months at least before the determina- "t[illegible] of the tenancy, give notice in writing to "the landlord of his intention to make such "claim" then. "where a tenant gives such notice, "the landlord may, before the determination of the "tenancy, or within 14 days thereafter, give a counter- "notice in writing to the tenant of his intention to "make a claim in respect of any waste, any breach of "covenant, or other agreement." According to my experience that has worked very badly, because it gives an opportunity to the landlord to put in a counter-claim of a greater amount than the claim that the tenant has made.

Mr. S. B. L. Druce.

10 May 1894.

19,957. Has the tenant to state the amount of the claim?—The section proceeds:—"Every such notice and counter-notice shall state, as far as "reasonably may be, the particulars and amount "of the intended claim." As a matter of fact, the amount always is stated, at least in every claim that I have seen. It gives an opportunity to the landlord of giving a counter-notice of greater amount than the amount included in the tenant's notice. I think I am right in saying that that operates against tenants claiming under the Act at all, they are rather frightened; they say, "It is all very well for me "to give notice, and make this claim for this 100*l.* that "I think I am entitled to for the consumption of cake, "or what not, but I may have a claim made against "me for not having cropped this field quite correctly, "in accordance with the terms of my agreement, or "what not, and that may run up to a couple of hundred "pounds." I think it has rather operated in that way and so prevented the Act being of as much use as it might otherwise have been.

19,958. How would you correct that evil?—I think it might be corrected by making both the claims—I would not call one or the other the counter-claim; I would call them both claims—at the same time; let the tenant make his claim on the landlord, and let the landlord make his claim on the tenant contemporaneously within a certain time, say 14 days, or I think the Chamber of Agriculture has suggested 28 days, before the determination of the tenancy. Whether it is 28 days, or whether it is 14, it should be some reasonable time, but both should be made within the same time. Then, of course, you must give the landlord an opportunity of amendment, as regards dilapidations, which he can only really get at after the removal of the tenant.

19,959. Damage may be done, for instance, in removal?—Yes, you must provide for that, but I think it is desirable that the notices on both sides should be given contemporaneously.

19,960. Would not that have this effect, that the landowner in most cases would make a claim in order to protect himself, whereas at present he can only make a counter-claim in case a claim is made? Would not there be many more landlords' claims under that system?—I do not know; I do not think there would be.

19,961. Do you think it would increase the number of tenants' claims?—I think it would increase the number of tenants' claims. I think it would do away with that fear there is on the part of the tenants now.

19,962. But then, unless the landlord lodged a claim on the same day, he would be precluded from counter-claiming again at any subsequent period?—Of course you might have no notice of claim at all; it might be done in that way; you might have no previous notice on either side, but at the determination of the tenancy you might have the claims made.

19,963. Do you think that many tenants have been precluded from claiming from an unfounded fear of having a counter-claim?—I do not like in giving evidence before a public Commission to put matters too strongly. I cannot say that I could put my finger on cases in which I have known that to happen. I cannot honestly say so, but from what I have heard in talking to men generally, that is the opinion that I have formed. If you were to ask me to give you specific instances where it happened, I am bound to say I could not; but that is the impression I have formed in talking with farmers. I do not put it any higher than that; I cannot.

Procedure under the Act.

19,964. Do you consider that the procedure is troublesome and expensive?—I am afraid it is. I am afraid, on the other hand, that a good many people who talk about it, do not quite understand the procedure. If people look at the procedure under the Act, they will see that it may be of the simplest character,—absolutely as simple as possible. "The landlord and tenant may "agree on the amount, and mode, and time of pay- "ment of compensation to be paid under the Act."

Mr. S. B. L. Druce. 10 May 1894.

They need not have a valuer at all, the landlord and tenant may meet and settle it together across the table. Nothing could be simpler than that. If they cannot do this the proceedings again may be very simple. "If the parties concur there may be a referee "appointed by them jointly." Nothing can be more simple than that. If two men cannot agree on certain differences between them, they may say, "We refer the difference to A. B.;" that is simple enough. But those simple cases do not happen often, and those are not the cases that generally arise under the Act. The cases under the Act are cases not so simple, but cases where the procedure has to be a referee on each side, and an umpire, and that undoubtedly means expense and time. It would, I think, be a very good thing if that procedure could be simplified, shortened, and made less expensive. But I am free to confess that when we have got to that stage, it is very difficult to suggest any plan by which it can be done. I have often heard farmers say, "We used to do the same thing much "more simply in the old-fashioned valuations, between "the incoming tenant and the outgoing tenant—"one man was chosen, and he came and looked "at the farm, and it was all done in the course of "half a day. But now there are adjournments and "sittings and witnesses, and so on; so that it takes "a very long time." But then it must be considered in answer to that, that the cases under the Act are not of the simplicity that an old-fashioned valuation between an incoming and an outgoing tenant was; so that I have great difficulty in suggesting how the procedure can be simplified. One point I would like to put before the Commission is, with regard to the umpire. My idea is, that you ought to make the umpire as strong a man as possible. Section 10 of the Act enacts that "If either party on appointing a referee "requires by notice in writing to the other that the um-"pire shall be appointed by the Land Commissioners," (that is the Board of Agriculture now) "then the umpire shall be so appointed." I think that ought to be made compulsory, that is to say, that the umpire in these cases ought to be a man who has the imprimatur of his capacity stamped on him, so to say, by the Board of Agriculture. I would suggest that there should be some certain number, a dozen more or less of men of approved capacity suggested or nominated by county councils in every county, and that they should be approved by the Board of Agriculture, and that every reference under the Agricultural Holdings Act should be to one of those men. I think in that way you would get as strong a man as possible, and you would do away with anything like a desire for an appeal from him. I would only have the appeal on matters of law.

Mr. S. B. L. Druce. 10 May 1894. Official umpires.

19,965. You think that many of the existing arbitrators are of an unsatisfactory description?—I think they are; I do not think they are quite as good men as they ought to be.

19,966. And that that encourages appeals from their decisions?—I rather think it does. I think the stronger you make the arbitrator or umpire in the first instance the better.

The witness withdrew.

Adjourned till to-morrow at 12 o'clock.

Thirty-seventh Day.

Friday, 11th May 1894.

PRESENT:

THE RIGHT HON. GEORGE JOHN SHAW-LEFEVRE, M.P., IN THE CHAIR.

Viscount COBHAM.
The Right Hon. BARON RENDEL.
Sir ROBERT NIGEL FITZHARDINGE KINGSCOTE, K.C.B.
ROBERT GIFFEN, Esq., C.B.
CHARLES ISAAC ELTON, Esq., Q.C.
Captain OWEN THOMAS.
FRANCIS ALLSTON CHANNING, Esq., M.P.
JOHN CLAY, Esq.
CORNELIUS NEALE DALTON, Esq., C.B.
ROBERT LACEY EVERETT, Esq., M.P.
JOHN GILMOUR, Esq.
GEORGE LAMBERT, Esq., M.P.
WILLIAM CUTLACK LITTLE, Esq.
WATSON HUME LONG, Esq., M.P.
CHARLES WHITEHEAD, Esq., F.L.S.

HERBERT LYON, Esq., *Secretary.*
R. F. CRAWFORD, Esq. } *Assistant Secretaries.*
FREEMAN THOMAS, Esq. }

Mr. S. B. L. Druce. 11 May 1894. The Agricultural Holdings Act. Official referees.

Mr. SAMUEL BENJAMIN L. DRUCE recalled, further examined.

19,967. (*Viscount Cobham.*) Will you continue your evidence with regard to the procedure under the Agricultural Holdings Act?—I was saying yesterday that I think the great point in proceedings under the Act is that the gentleman who determines the matter in the first instance, whether you call him a valuer or a referee or arbitrator, or whether he be an umpire, should be as strong a man as possible, and I would have no appeals from him at all.

19,968. You would have one man from the first?—Yes; as I was saying yesterday the principle should be simplified as much as possible. If it were possible I would have a single referee or valuer, who should be, as I suggested, a gentleman having the imprimatur of the Board of Agriculture; some number of whom, I do not limit myself to any special number, but some few should be nominated for each county. Then, having such a strong man as that in the first instance, you really, it seems to me, want no appeal from him at all, except on matters of law, and as regards matters of law I think that there should be a right of appeal.

19,969. Even when the sum in question is a trifling amount?—Questions of law arise on small matters, perhaps even more difficult questions on small than on large ones, and I think it would be rather unfair to limit appeals as to matters of law by the amount awarded; although of course I recognise that it makes it perhaps rather hard on a man that he should be subject to an appeal where the amount awarded is small. Still I think that justice requires that there should be appeals in every case, but only on matters of law.

Mr. S. B. L. Druce. 11 May 1894. Right of appeal.

19,970. (*Chairman.*) At present when the two parties choose arbitrators, and they choose an umpire, is not the appeal confined to questions of law?—Section 23 of the Act applies to appeals: "Where the sum claimed "for compensation exceeds one hundred pounds, "either party may, within seven days after deli-"very of the award, appeal against it to the judge "of the county court on all or any of the following "grounds:—(1) that the award is valid; (2) that the "award proceeds wholly or in part upon an improper "application of or upon the omission properly to apply

Mr. S. B. L. Bruce. 11 May 1894.

"the special provisions of sections 3, 4, or 5 of "this Act; (3) that compensation has been awarded "for improvements, acts, or things, breaches of "covenants or agreements, or for committing or "permitting waste, in respect of which the party "claiming was not entitled to compensation; (4) that "compensation has not been awarded for improve-"ments, acts, or things, breaches of covenant or "agreement, or for committing or permitting waste, "in respect of which the party claiming was entitled "to compensation."

19,971. Do you know whether there have been many appeals under that Act?—I know that there have been several, and in some I have been personally concerned, not on the appeal, but as regards the award. The section goes on: "The decision of the judge of the "county court on appeal shall be final, save that the "judge shall, at the request of either party, state a "special case on a question of law for the judgment of "the High Court," and the decision of the High Court shall be final.

19,972. So that there may be on questions of law two appeals: an appeal to the county court and further to the Supreme Court?—Yes, and there have been. I can give you references to cases if you wish them.

19,973. (*Mr. Elton.*) And the Appeal Court makes the third appeal?—The Appeal Court makes the third appeal. I do not know a case that has been taken to the Lords as yet.

19,974. There is one in the Appeal Court now?—There are two or three in the Appeal Court.

19,975. (*Chairman.*) I thought, as you read it out, that the judgment of the High Court was to be final?—So it says, but notwithstanding that, there have been appeals. They are brought about in this way, you commence proceedings against the county court judge to compel him by mandamus to hear the case; or by prohibition to prohibit further proceedings on an order that he has made.

19,976. Therefore it is not exactly an appeal from his decision as to compensation, but a proceeding against him for neglect of duty?—In a way that is so, but the result is the same. The matter is brought before the Court of Appeal and is determined upon the merits there. That was so in Paul's case, under section 7 of the Act. The question there was when the determination of the tenancy took place. The case is reported in the 24th Vol. of the Queen's Bench Division of the Law Reports.

Paul's case.

19,977. How did that arise?—The question at issue was whether the notice of claim under the Act was good, the tenant had given up a part of the farm—the main part—on old Michaelmas day, but had, according to the custom of Dorsetshire—it was in Dorsetshire that the case arose—continued in the occupation of certain parts of it till the following February, and his notice of claim was given two months before the last date. The question accordingly resolved itself into this, was the tenancy determined within the meaning of the Act on old Michaelmas day or in February.

19,978. How was it the matter went before the Court of Appeal; was that originally by way of mandamus to the county court judge?—Yes, or by prohibition.

19,979. Have you got a reference to the case?—I did not bring my Law Reports down; I can give you the reference, 24 Queen's Bench Division, page 247.

19,980. Was it a mandamus to the county court judge to hear the case?—It was either a mandamus or a prohibition: I forget which.

Farquharson *v.* Morgan.

19,981. (*Mr. Elton.*) There is another one, the case of Farquharson?—That is quite a recent case.

19,982. (*Chairman.*) How did that arise?—Farquharson *v.* Morgan is the case to which Mr. Elton alludes; it is reported in the Law Reports for this year, 1 Queen's Bench Division, page 552. That arose in this way: at the end of a tenancy a valuation was made of acts of husbandry and various other matters not within the Act, and there was also a reference under the Act; and one award was made in respect of both. Now, under section 24 of the Act an award made under it may be enforced by "order made by the judge of "the county court as money ordered by a county "court under its ordinary jurisdiction to be paid, is "recoverable." The tenant applied to the county court for an order, not only for the payment of the compensation that had been awarded to him under the Act, but also for the compensation that had been otherwise awarded to him.

Mr. S. B. L. Bruce. 11 May 1894.

19,983. (*Viscount Cobham.*) By the same valuer?—By same valuer and at the same time.

19,984. Under the same proceedings?—Not the same proceedings.

19,985. Separate proceedings?—The same "proceeding" in a non-technical sense—a separate "proceeding" in a technical sense. The application to the county court was for an order for payment of the whole amount. "No," said the other side, "the county court "judge can only give you an order for payment of what "is payable under this Act. He has no authority to "make an order for payment of the rest."

19,986. If he had separated the amounts he would have been right?—If he had separated the amounts and made an order for payment of what had been awarded under the Act he would have been right, yes, but he did not. He made an order for payment of the whole amount. And then there was an application for a prohibition against him for exceeding, in point of fact, his judicial functions; and that was brought in the Queen's Bench Division and carried from there to the Court of Appeal.

Awards payable under the Act, and under the custom of the country.

19,987. Do you think that is an anomaly and a grievance that ought to be corrected?—I think that it is an anomaly and a grievance that ought to be corrected. The question has often been put to me whether a valuer or an umpire determining the claims payable on the determination of the tenancy could include in one award all those matters and things for which compensation is payable under the Act, and also all the matters and things which are commonly payable under the custom of the country, and I have always advised that two different awards should be made, and now the question has been tried out. As a matter of convenience, and in fairness, it is only right, in my opinion, that the Act should be amended in this respect, so that the whole payments payable on the determination of a tenancy may be included in one award, and enforceable as one sum.

Tribunal of appeal.

19,988. Do you think that the county court judge, with assessors, would form a good tribunal of first instance?—No, I do not. Personally I do not think that the county court judges are at all the tribunal for these matters. I quite recognise the great convenience and facilities for approaching them, but I think myself that it is much better in the first instance, not to have a lawyer in these matters. I think that the matter should be left wholly to the valuer—call him by what name you will—but to the gentleman, whom I say should be a strong man, and that the court should only be invoked if he has gone wrong in matters of law. He can always be advised; I have myself sat as legal assessor to an umpire acting under this Act.

"Notice," sect. 33.

19,989. Have you any other cases of appeal which you wish to direct our attention to? I think there has been a case or two about the construction of the word "month" with regard to notice?—These cases refer to notice under a different section and not with regard to compensation. They arose under section 33.

19,990. Do you think that the section should be amended so as to clear up the law on that point?—No, I do not think so. I think the decisions are clear enough.

19,991. I do not know whether it is worth going into if you have not a recommendation on the point?—The words of the present Act are very clear: "Where a "half-year's notice, expiring with the year of tenancy, "is by law necessary," that has been held to be by law, that is by operation of law and not where the notice is under contract.

19,992. Before the decision there was considerable doubt, and there have been hard cases, have there not?—Some rather hard cases to the layman's mind certainly, the decisions being rather unexpected. The most recent case is Barlow *versus* Teale, reported in the Law Reports, 15 Queen's Bench Division, page 501.

19,993. The law having now been made clear nothing more need be done?—I do not think there is any necessity for amending that.

Time for making awards.

19,994. Under the compensation clause have you any other cases to refer to?—Assuming that the procedure of two referees and an umpire is continued I think it might well be that the time within which they must act should be shortened. I have heard a great many complaints of the time that is taken in making these

Mr. S. B. L. Druce.

11 May 1894.

valuations and awards, and perhaps some of the times might be shortened; for instance, section 18 enacts that "the umpire shall make his award ready for deliv- "ery within 28 days after notice in writing given to "him by either party or referee of the reference to him "or within such extended time (if any) as the regis- "trar of the county court from time to time appoints "on the application of the umpire or of either party." Well, complaints have been made that those 28 days might be shortened, or at all events that the time should not be extended because, as a matter of fact I believe, the time is always extended as a matter of course.

19,995. It is made to suit the convenience generally of the referees or arbitrators?—Entirely. There is not much in that. You must study the convenience of these men. You have to consider that the bulk of these references come on all at once, and that a man to do his duty and to make a proper award must have time so that there is a good deal to be said on both sides; but I thought it right to mention the point to the Commission, because I have heard complaints made about it on several occasions by various farmers.

Remuneration of valuers.

19,996. The valuers you wish appointed would not be salaried officials?—No, but I think the scale of charges ought to be fixed by the Board of Agriculture.

19,997. Not their present scale? Do you know the present scale of remuneration for valuers?—I do not.

19,998. It is three guineas a day and expenses and something extra for report. Do you think you would get men to do the work for that?—I am afraid you would not quite get the tip-top men to do it for that, but under ordinary circumstances that is quite sufficient.

19,999. But necessarily they would be more or less busy men, and they would frequently want an extension of time?—They do.

Appointment of umpire.

20,000-1. Have you referred to sub-section 1 of section 10 yet?—I think I called attention to that yesterday. The section runs: "Provided that where two referees are "appointed an umpire may be appointed as follows:— "(1) If either party on appointing a referee requires, "by notice in writing to the other, that the umpire "shall be appointed by the Land Commissioners for "England, then the umpire, and any successor to him, "shall be appointed on the application of either party "by those Commissioners"—that is, of course, the Board of Agriculture now. "(2) In every other case, "if either party on appointing a referee, requires, by "notice in writing to the other, that the umpire shall "be appointed by the county court then unless the "other party dissents by notice in writing therefrom, "the umpire and any successor to him shall on the "application of either party be so appointed, and in "case of such dissent the umpire, and any successor to "him, shall be appointed on the application of either "party by the Land Commissioners for England"—now the Board of Agriculture. I think that section is very little known. I have heard so many complaints as regards the class of people who are referees or umpires, that I think that farmers generally do not really know that the Act does provide that either party may by notice in writing require the umpire at the present time to be appointed by the Board of Agriculture.

20,002. There have not been a very large number of cases under the section?—Very few. I think the section is very little known. When I was in this room the other day I heard a gentleman who was being examined give his evidence as if that section was not in the Act at all; and from what people have told me and what I have heard in other cases the powers of that section are very little known.

20,003. But you would modify that section in conformity with the suggestion you make as to the appointment of one umpire selected in the first instance?—I make the reference to a strong man in the first instance.

20,004. Appointed by the county council or his name only submitted by the county council?—That is all; no further than that the name is submitted by the county council and approved by the Board of Agriculture. I go no further than that. Many of these references, in fact the bulk of them when the referees are appointed by both parties, if the matter is at all a difficult one, they always appoint an umpire. What then becomes of the referees? He simply becomes a witness for the person who employs him or his advocate or both.

20,005. (*Chairman.*) What amounts to is that three persons are doing the work of one?—Certainly.

Mr. S. B. L. Druce.

11 May 1894.

20,006. And there are two arbitrators and an umpire, and the referees have nothing to do?—The referees have nothing to do—they are simply witnesses for the parties who appoint them, or advocates for them.

20,007. Then the parties have to pay the expenses of all three?—Certainly.

Land agent as valuers.

20,008. (*Viscount Cobham.*) You know the existence of the class of valuers that may be called farmers' valuers?—Yes, I do.

20,009. Are there many competent men among them?—It is rather a difficult question to answer.

20,010. There are some?—Some, undoubtedly.

20,011. What I was pointing to was this, that the county council might only select men of large practice and high reputation and the tenant farmers might think that their interests were to some extent neglected in the nomination?—I do not think so, because I think county councils, at least I hope so, would select men who were rather valuers than land agents. I think that much of the dissatisfaction with the Act has arisen from the fact that gentlemen who are land agents, and therefore necessarily cannot help themselves from being on the side of the landlords, are umpires and referees and valuers; I think half our troubles arise from that. The farmers think that is not a fair tribunal.

20,012. There are not many well-known referees who are not at the same time land agents?—You can pick out, so far as I can call to mind at this moment, at least two or three in every county who are well known, who are better known as valuers than as land agents.

20,013. They are generally auctioneers?—Very often.

20,014. And they might be men who might be fairly entrusted with the interests of the farmers?—I think so. I had better not mention names but names occur to me—a number of them.

Extension of section 34.

20,015. Have you anything else to say on the Agricultural Holdings Act?—I think section 34 requires extension. That section permits the tenant to remove any engine, machinery, fencing, or other fixture, or any building erected by himself for which he is not under the Act or otherwise entitled to compensation. I think that the section might be well extended to glass-houses and forcing pits, and such like things that are put up by market gardeners for the purposes of their business.

20,016. Are they generally worth removing?—In many instances, yes, because of the change in the method of agriculture, especially near large towns. There was a case not long ago before Mr. Justice Kekewich (Meux *v.* Cobley, Law Reports, 1892, 2. Chancery, p. 253), in which a tenant had taken a farm on the borders of Hertfordshire, and converted a good part of the arable land into a market garden, and covered fields with glass under which he grew tomatoes and other hot-house produce for the London markets. I have heard of many other cases in which men are doing that class of thing at the present time, and I think, having regard to the change that has taken place in agricultural production, and to the system of farming that is carried on near large towns, that the section might well be amended in this direction. In the case I have just cited the landlord brought an action to stop the tenant from converting the farm into a market garden, but the tenant won.

20,017. At present do you say that glass-houses would not come under this section at all?—I do not think they would—I am not quite sure. Mr. Justice Kekewich at the end of his judgment intimated that they were improvements within the Act, but gave no decision upon that point.

20,018. Why did the landowner try to prevent the erection of glass-houses?—There were a good many other circumstances in the case I think—they rather interfered with his privacy, and so on. You are probably aware that Sir Edmund Lechmere, Mr. Jesse Collings, Sir Frederick Dixon Hartland, Sir Algernon Borthwick, and Sir Richard Temple last year introduced into the House of Commons a Bill, and I think it has been re-introduced this year, which extends this Section 34, to every conservatory, forcing house, forcing pit, or any other erection or building put up or constructed or affixed by a tenant for the purpose of his business as a market gardener upon or to a holding cultivated wholly or partly as a market garden.

Mr. S. B. L. Druce.
11 May 1894.

Section 54.

20,019. What do you say as to section 54?—If I may humbly say so Section 54 is very muddlingly worded; and whether it is sufficient to extend the Act to market gardens I do not know—I think it does, but I think it might well be made clearer, it runs thus: "Nothing in this Act shall apply to a holding that is "not wholly agricultural or wholly pastoral, or in "part agricultural, and as to the residue pastoral, or "in whole or in part cultivated as a market garden." I think those words are sufficient to extend the Act to market gardens, but you will see it is not very clear. I read it in this way: "Nothing in this Act shall apply "to a holding that is not," and then "either" introduces the first set of circumstances, while the second is introduced by the "or" before the words "in part," and the third by the word "or" before the words "in whole" so that we may read: "Nothing in this Act "shall apply to a holding that is not in whole or in part "cultivated as a market garden." Some people read it: "Nothing in this Act shall apply to a holding that "is not either wholly agricultural or wholly pastoral, "or in part agricultural, and as to the residue pastoral "or in whole or in part market garden," placing the last disjunctive after agricultural.

20,020. (*Mr. Little.*) It is the remainder of the clause that makes the difficulty, is it not? The first was inclusive and the second exclusive?—As I say it is a very muddling clause, I think it might well be made clearer.

Limit of area.

20,021. (*Viscount Cobham.*) There is a minimum area fixed by the Act, is there not?—No, that was so in the 1875 Act. The 58th section of the 1875 Act says: "Nothing in this Act shall apply to a holding that is "not either wholly agricultural or wholly pastoral, or "in part agricultural and as to the residue pastoral, "or that is of less extent than two acres." There is no limit as to area in the 1883 Act.

Consent of landlord under section 56.

20,022. Then in section 56, you recommend some change in that?—I do not think you want the consent of the landlord there. That section 56 says: "Where an "incoming tenant has, with the consent in writing of "his landlord, paid to an outgoing tenant any "compensation payable under or in pursuance of this "Act in respect of the whole or part of any improve-"ment, such incoming tenant shall be entitled on "quitting the holding to claim compensation in "respect of such improvement or part in like manner, "if at all, as the outgoing tenant would have been "entitled if he had remained tenant of the holding "and quitted the holding at the time at which the "incoming tenant quits the same." I do not think the consent in writing of the landlord is necessary there, and also I should like to extend the section to payments made by an incoming tenant to an outgoing tenant for fixtures or buildings under section 34.

20,023. (*Captain Owen Thomas.*) Who is to decide the amount of compensation between the old tenant and the incoming tenant?—It is the amount awarded under the Act. It is only compensation payable under or in pursuance of this Act.

Non-scheduling improvements.

20,024. (*Viscount Cobham.*) You say that dilapidations and deteriorations should be scheduled as well as improvements?—My strong opinion is that we do not want any schedules at all. I do not know whether I am in order in referring to my report on the Duke of Richmond's Commission where I went very fully into that question.

20,025. You can read any material passages?—It is a report to the Duke of Richmond's Commission on Agriculture made by myself C.—3375, Part II., 1882; I wrote this you will remember before the 1883 Act was passed. I say:—"I think it would be better that the "improvements should not be ennumerated and that "the time within which they should be considered as "unexhausted should not be prescribed"—that has been done by the 1883 Act—"for although the lists of "improvements contained in the Act (1875) are very "comprehensive yet it is possible they do not exhaust "all the improvements that may be effected on a farm, "for instance, the grubbing up a hedge row is not "included in any of the three clauses contained in the "Act, but it may be and often is a very great improve-"ment;" and then I go on about the time which does not apply now. "For all these reasons I would suggest "that in any fresh legislation on this subject lists of "improvements should not be specified and that no "time should be prescribed within which any improve-"ment should be considered to remain unexhausted. "In my opinion the security for which the farmers "ask should be given by a very short Act of Parlia-"ment which should enact (in effect) that in any con-"tract of farm tenancy there should be implied, on the "one hand, agreements by the landlord to compensate "the tenant for (1) any money laid out by him (the "tenant) upon the farme whereby its letting value as "a farm is increased; and (2) for unconsumed hay and "straw and manure and for growing crops left on the "farm at the expiration of the tenancy, and for all acts "of husbandry or tillages performed by the tenant in "the proper course of husbandry since the taking of the "last crop; and on the other hand, agreements by the "tenant to keep the farm clean and to farm it properly. "If on consideration it should be found that the land-"lord has not by law a right to set off against any "moneys payable by him to the tenant under the above-"mentioned agreements, or otherwise under his con-"tract with the tenant, any sums payable to him by "the tenant for rent, damages for breach of contract "and all other sums (if any) payable by the tenant "under the same contract, such right should be given "to him. But it appears to me as soon as the sums "payable by either party to the other are ascertained "the right of setting off attaches;" and then I refer to the case of Stafford *v.* Gardner, which is reported in the Law Reports, 7 Common Pleas, Rule 242. "In "this way it appears to me that the tenant would be "compensated for the whole of his interest in his im-"provements and for the whole of his interest in his "tenancy, for he would be entitled not merely to be "recouped the money which he had laid out or part of "it, but to be paid for his competency, for his skill, "and for his special knowledge which had enabled him "to effect the improvements in the way best calculated "to increase the lettable value of the farm." And I adhere to that now.

20,026. How can a valuer ascertain the increased value of the farm without something in the nature of a schedule at the beginning and termination of the tenancy?—You must have a valuation or report at the beginning, but you need not schedule the improvements, you must have a statement when a man comes in as to what state the farm is in, but that is a different thing from having improvements scheduled.

Scheduling the condition of farms.

20,027. What has been urged by several witnesses is, that there should be a schedule, a detailed schedule, of the condition of the farm in every respect at the beginning and at the termination of the tenancy?—I entirely advocate that.

20,028. You recommend that; you call that a statement?—Yes.

20,029. You keep it distinct from a schedule of improvements?—Yes, I go on to say that in this report; or rather, I think it is in my evidence when I was cross-examined on this point for a long time.

20,030. You did not see any difficulty about different men going over the farm, which would be necessarily the case, very frequently?—No. The statement or report should be in writing of course.

20,031. But of course, "condition" is a somewhat uncertain and vague term; it is difficult to describe?—It is difficult to describe, but to a practical man it is visibly patent.

20,032. To the same man, of course, it would be?—Of course, every man has not the same ideas; but still, I think there would not be much difference of opinion amongst practical men as to whether a farm was in good condition, or not.

20,033. And you think it would be workable?—I think it would be workable. I have read that such a system is in actual operation at the present time in the north of Italy.

20,034. Is that on the estates where the "Metayer" system is in operation?—No, I think not.

The schedules under the Act.

20,035. But if you have schedules, do you know of any direction in which they could be improved?—I agree with the Chamber of Agriculture Report that if you schedule improvements you should also schedule dilapidations or deteriorations. But when you have the schedules, what practical use are they, when you have a general item, such as the Central Chamber of Agriculture proposes in the following words: "Any "other improvement increasing the value of the hold-"ing, as an agricultural holding, and not specifically "mentioned in this schedule for which the tenant is "not otherwise compensated;" if you have a sweeping item of that sort—an omnibus item so to say—it seems

Mr. S. B. L. Druce. 11 May 1894.

to me that you do not want the specific ones. And so with regard to the compensation to the landlord for dilapidations, item 11 runs "Other dilapidations and "deteriorations, or decreased fertility of the holding, "caused by the act or neglect of the tenant, which "detract from the letting value of the holding." What do you want with an omnibus clause like that? If you have an omnibus clause, why should you have the specific ones? I do not see the necessity for the specific ones with a sweeping omnibus clause at the end of that sort. My plan seems a preferable one.

20,036. Should you extend the list of improvements on the schedule?—Yes, I should like to see one or two alterations; Number 3 in Part 1—Laying down of permanent pasture; Number 4—Making and planting of osier beds; Number 9—Making fences; and Number 6—Making gardens, should be transferred to Part 3; that is, should be included amongst improvements to which consent is not necessary; and I also think that as regards market gardens, planting of orchards, or fruit bushes, should be removed from Part 1, and with planting of standard fruit trees, planting of fruit bushes, planting of strawberries, and planting of asparagus, and such like crops, be included in Part 3. Then while on the schedule I think that it should be made quite clear that cattle includes horses. It is a very difficult question. I have had the question before me professionally on more than one occasion, and quite recently, to advise whether corn consumed by horses on a farm comes within this schedule or not, and it is a very puzzling and difficult question to determine.

Compensation for corn consumed by horses.

20,037. Has it ever been legally decided that cattle includes horses?—Not under this Act but in other Acts. It has in the Cruelty to Animals Act, and also in Wright *v.* Pearson (Law Reports, 4 Queen's Bench, p. 582), which was a case of worrying cattle by dogs; and there it was held that cattle did include horses. But there has been no case, so far as I know (and I have made a thorough search only very recently) which has determined the question under this Act, and I think it ought to be made clear one way or the other. Personally I should like to see horses included.

20,038. (*Mr. Elton.*) Would you like to see a common phrase "horses and other cattle"?—That would do very well.

20,039. (*Viscount Cobham.*) You mean the working horses of the farm?—There is a difficulty about working horses; but in such a case as I had before me recently, where a man bred a number of horses, and kept them very well indeed, and fed them with a considerable quantity of purchased corn, I think compensation for the consumption of that corn should be allowed, and I am not at all clear that it is allowed.

20,040. Corn grown on the farm?—No, I am not on that point yet; I will take that separately, if you please. I think that certainly in the case where a man occupies a breeding or stud farm, the consumption of corn by horses should be allowed for. The case of the ordinary farmer is more difficult, and no doubt there is a great deal to be said on both sides of the question. But on the whole I do not know why the consumption of corn by ordinary farm horses should not be allowed for, inasmuch as the manure made by those horses does good to the farm, and is used on the farm, which is the only reason, so far as I know, why the consumption of corn by other animals is allowed for.

20,041. But all the manure does not go on to the farm?—Not all of it, because when the horses go along the high roads a good deal of it is left on the road.

20,042. It is different from cattle in that respect?—It is different from cattle in that respect undoubtedly, but still, after all a good deal is not left on the roads. You generally see a pretty good heap of manure outside a stable door, and I do not know why the farmer should not be entitled for that in the same way as he is allowed for manure made by his cattle.

20,043. (*Mr. Channing.*) I wish to know whether you would accept the wording of the Central Chamber of Agriculture, "consumption on the holding by horses engaged or kept on the holding," as a sufficient line of distinction between the horses used on the road and the horses used on the farm?—I have made a note of that.

20,044. Do you think these words are satisfactory, it is a very difficult distinction to draw?—It is a very difficult distinction. I am not prepared to suggest any better words.

20,045. (*Viscount Cobham.*) Should not you say that the farmer, as a rule, who claims for purchased corn would require to have his accounts looked into very closely as to whether the cattle or horses ate the corn? He can produce vouchers, and do not you imagine that he is generally compensated?—I do not think that he is compensated for what his horses consume.

Mr. S. B. L. Druce. 11 May 1894.

20,046. You think that it is disallowed?—I do not think it is allowed. My experience goes to that.

Compensation for consumption of home-grown corn.

20,047. With regard to corn grown upon a farm, what do you say?—I think the Act requires to be amended. I think that corn that is produced on the holding ought fairly to be paid for now, and for this reason, that the farmer always used to consider his corn crop—that which paid him for his other crops—that is to say, taking the four-course shift for example, he did not look for an actual return from his roots or clover, but from the corn that he grew after the roots or clover. Well now the corn is at such a very low price that it has paid the farmer better to use it as food for his stock than to sell it as food for human beings; and by the consumption of that food he has not required so much purchased food. If he had used purchased food he would, under the Act, have been entitled to compensation, but the stock has derived the same benefit; the manure from the stock is as good; and the land, therefore, has acquired as much benefit, as it would have acquired from the purchased food consumed by the same stock. Therefore it seems only fair that the farmer should be paid for the corn which he uses as food for his stock instead of selling, and which being so used does the same good as the purchased food. In proof that a great deal of English corn is now consumed by stock, my friend, Mr. John Treadwell, of Upper Winchendon, Buckinghamshire, who is an ex-chairman of our Farmers' Club, and a very active member of our committee, has given me the value of corn that he has sold off his farm, and that he has consumed at home during the past five years. The figures run thus:—

Year.	Consumed.	Sold.
	£	£
1888–89 - -	651	1,047
1889–90 - -	914	1,039
1890–91 - -	981	1,181
1891–92 - -	772	1,193
1892–93 - -	963	940

You see in those figures how the consumption of home-grown corn increased from 651*l.* in 1888–89 to 963*l.* in 1892–93.

20,048. Is that entirely owing to the fall in price or is it partly owing to the low quality of the corn grown?—Mainly I think to the fall in the price. I have not been able to get the figures for 1893–94, but you will notice that in 1892–93 the value of the home-grown corn consumed is more than the value of the corn sold. This is only an example of what is going on in many parts of England. I have no doubt you all know that at the Woburn experimental farm of the Royal Agricultural Society of England, experiments have recently been made with regard to the feeding value of home-grown corn, more especially wheat, and that it has been demonstrated that the feeding properties of home-grown corn are as good as many purchased foods, and I think as good—I am not quite sure of the fact here—but I think as good as oil cake.

20,049. There is a little more risk in giving it, is there not?—We had a discussion on this only last week at the Farmers' Club. Dr. Voelcker then read a most interesting paper on the feeding experiments that had taken place at Woburn since they were started both in his father's time and his own. Dr. Voelcker told us, and he was backed up by a most practical man, Mr. Charles Howard, who has taken a very great personal interest in these experiments, and who you will remember was a member of the Duke of Richmond's Commission, that there was very little danger indeed, if any, as regards the consumption of wheat by stock. I must confess it took—I do not say myself, because I do not know anything about it—but it took most of the practical farmers in the room rather by surprise, because there is an idea still extant that wheat is an unwholesome food, and given in quantities may do more harm than good.

20,050. (*Mr. Lambert.*) I lost five ewes in one week by giving them wheat?—Well I shall be happy to send

Mr. S. B. L. Druce. 11 May 1894.

you a copy of this paper. I think I am right in what I say; there is not that danger that farmers generally think there is. I quite admit that the statement took the practical farmers in the room somewhat by surprise as apparently it has taken you.

20,051. (*Viscount Cobham.*) You recognise the difficulty of ascertaining the value?—Yes, there is a great difficulty in ascertaining the value; there is a difficulty in ascertaining the amount consumed and putting a proper value upon it.

20,052. How do you get rid of the difficulty?—Of course the farmer could not be paid for it unless he proved to the umpire or valuer that the home-grown corn was given to the stock, and that he must do by means of his workmen who actually fed the stock. And the value would be ascertained roughly in this way, we all of us know what the market value of the corn is on a particular day in a particular neighbourhood, and the valuer would say, "Mr. So-and-So would "not give his stock the very best of his wheat or his "barley or his oats; he would sell that, so that we must "not take the tip top price but something under it." I think the value might be got at like that. There may be better ways. I do not profess to lay down any hard and fast rule upon that subject; but that occurs to me; you get the value by taking something under the market value of the day, and you would get the quantities by the evidence of the farmer and his men. Of course if he kept his books and entered them up, they would be certain evidence but not sufficient. You must get the evidence of the carter or the shepherd, or head man that the corn was given.

20,053. At the present time in the case of two farms being held by one man you would have to rely a good deal upon the statement of the tenant as to where the purchased food was consumed?—Undoubtedly. Of course in the case of purchased food under the Act tenants are always required to produce the bill so that you have that check upon them.

20,054-5. But as to where the stuff is consumed you must take the word of the tenant?—Yes, but you must not consider all farmers as quite a bad lot.

Free sale of improvements.

29,056. You are not in favour of a free sale of improvements?—No, certainly not. I said something about that in my Report of 1882.

20,057. You do not wish to add anything to what you have said?—I have seen nothing that has occurred since I wrote that to alter my opinion upon that matter. Before passing from my report I should like, if I may, to refer to page 105 of it in connection with the six months' notice to quit on which I was examined yesterday.

Non-scheduling improvements.

20,058. Certainly?—May I also refer in connection with my evidence about the non-scheduling of improvements and of having a short Act of Parliament, to the Allotments and Cottage Gardens Compensation for Crops Act, 1887, which perhaps I may say is my draughting. It was brought in and carried through the House of Commons by Sir Edward Birkbeck, and to a certain extent it embodies that idea of mine of the short Act that I have just advocated. Section 5 says: "Upon the determination of the tenancy of a holding "after the commencement of this Act the tenant shall "be entitled notwithstanding any agreement to the "contrary to obtain from the landlord compensation in "money for the following matters and things, that is "to say:—(*a*) For crops, including fruit, growing upon "the holding in the ordinary course of cultivation, and "for fruit trees and fruit bushes growing thereon, "which have been planted by the tenant with the "previous consent in writing of the landlord." That is one thing:—"(*b*) for labour expended upon and for "manure applied to the holding since the taking of "the last crop therefrom in anticipation of a future "crop. (*c*) For drains and for any outbuildings, "pigsties, fowl-houses or other structural improvements "made by the tenant upon his holding with the "written consent of his landlord." I think with modification and a little alteration exactly the same principle will apply to a general Agricultural Holdings Act.

20,059. You do not bring in the general improvement of the holding?—Not quite.

20,060. But you specify every improvement for which compensation can be obtained?—Yes.

20,061. (*Mr. Channing.*) Do not you exclude that with reference to bushes?—I do not mean to say that that section is to apply to the proposed Act *in ipsissimis verbis*, but I call this Act in aid of the idea that I advocated in 1882.

Mr. S. B. L. Druce. 11 May 1894.

20,062. (*Viscount Cobham.*) As to the law of distraint, what do you say?—I think that the right of distress in spite of much that I hear from some of my farmer friends should be retained and not done away with. But I think that looking at it entirely from a legal point of view we want section 44 worded rather more clearly.

The law of distress.

20,063. (*Chairman.*) What are your reasons for that alteration?—One great reason is that the landlord is in a very different position as a creditor from any other creditors owing to the different nature of the property that he, so to say, sells; that is to say, lets to the tenant; and I also think that the right should be retained because it enables landlords to give their tenants time and not to be not very anxious, but easy with them in times of distress such as we have passed through.

20,064. It gives him no inducement to pay other creditors?—Quite so.

Limitation of landlord's right.

20,065. (*Viscount Cobham.*) How would you amend it?—I should like to see the section altered so that the landlord's right should be limited absolutely to one year.

20,066. We have had it stated here that the effect of such a law has been practically to give the landlord two years?—In some cases it is possible it may extend to two years, but it certainly extends to a year and a half; there have been several cases. Perhaps the one to which you refer is ex parte Bull *re* Bew, reported in the Law Reports 18, Queen's Bench Division, page 642. I have a case here before my old master, Mr. Holl, then a Judge of the County Court at Hexham, in which he decided exactly the same thing

20,067. (*Mr. Channing.*) Has not the rent been paid in advance?—It is rather difficult to express the reason of the decisions in a few words; it requires some little thought.

20,068. (*Viscount Cobham.*) I think we had the details of the first case in full?—Perhaps if I read the facts shortly of this case, the Commission would understand the reason of the decision much better than if I were to express them in my own language, "The plaintiff took the farm of Coalpits from the "defendant as a yearly tenant, from May 13th, 1874 "at the yearly rent of 230*l.*, subsequently re-"duced to 180*l.* 10*s.* By the agreement of tenancy "under seal it was provided that the rent should be "paid by two equal payments on the 11th November "and the 13th May, and the first payment was to be "made on November 11th, 1874. By the ordinary "course of dealing between the plaintiff and defendant "the payment of the rent was allowed to be deferred "until after the expiration of a half year after it "became due by the deed. Therefore the plaintiff did "did not make his first payment of rent until after "May 13th, 1875. This course continued down to "November 1886. On the 11th November 1886, the "plaintiff having got a further half year into arrear, "there was due according to the terms of the deed, "three half-years' rent, namely, that due 11th "November 1885; 13th May 1886; and 11th November "1886. On the 28th December 1886, the defendant "distrained for and was paid 270*l.* 5*s.*, the amount of "these three half-years' rents. The plaintiff brought "this action to recover 90*l.* 5*s.* half-year's rent "improperly distrained, on the ground that the "defendant could not make a distress for rent due "more than a year before making the distress; and "that if under the proviso to the 44th section, the "defendant could, by reason of the ordinary course of "dealing between the plaintiff and defendant include "in his distress the rent due by the deed 11th November "1885, he could not include that due by the deed 11th "November 1886, because the ordinary course of "dealing between the plaintiff and defendant allowed "the payment of such rent to be deferred until after "the expiration of a half-year after the 11th November "1886. Therefore it must (as provided by section 44) "be deemed to become due at such deferred period, "namely, 13th May 1887, and not at the 11th November "1886; and therefore, in any case, under the circum-"stances the defendant could not distrain for more "than one year's rent." Then the decision is:— "The intention of the Legislature may likely have "been not to allow the landlord to recover more than "a years' rent. But I think the effect of the section, "under the circumstances of the present case, is such

" that there is nothing to prevent the landlord re-
" covering a year and a half's rent. The main provision
" of the 44th section does not say that the landlord
" cannot recover by distress more than one year's rent,
" it only says he cannot make a distress for rent which
" is due more than one year before the making of the
" distress. It is admitted that there has been a custom
" that the rent should not be paid until a half year after
" the rent became due under the terms of the deed, and
" the rent which was thus due on November 11th, 1885,
" does not, for the purposes of the section, that is to
" say, for the purposes of the limitation arising under
" that section, become due until the 13th May 1886,
" and in the same way the rent which became due on
" the 13th May 1886, did not become due for the pur-
" pose of the limitation arising under the section until
" November 11th, 1886. Therefore there is no dispute
" with regard to these two half years' rent which the
" landlord was entitled to distrain for, it being rent
" which, under the terms of the proviso became due
" within 12 months before the making of the distress.
" The whole point turns upon whether or not there
" is anything in the section to preclude the landlord
" from distraining for rent which became due under
" the terms of the deed on November 11th, 1886.
" It is contended that by the custom of the parties,
" the rent not having been actually paid until six
" months after the time when it becomes due by the
" terms of the deed, that the landlord cannot distrain
" for it until after the time it is customary to pay it. I
" do not think the landlord is so precluded. I think it
" is a matter of grace that the landlord has allowed the
" tenant to pay the rent at a later period than that at
" which he was legally entitled to demand it and to
" distrain for it. I do not think you can imply from
" any such course of dealing an agreement which would
" have the effect of altering the terms of the deed. I
" think there would be nothing to preclude the land-
" lord from distraining for the half year's rent which
" became due on November 11th, 1886. I do not think
" the effect of the proviso is to take away from the
" landlord the common law right which he would other-
" wise have had to distrain for the rent which became
" due on the 11th of November 1886. Judgment will
" therefore be for the defendant." Precisely the same principle governed the decision in *ex pt.* Bull.

20,069. If the decision had been otherwise very little grace would be allowed in future?—Quite so.

Procedure under the law of distress.

20,070. What do you say as to the procedure under the law of distress?—I think the procedure on the law of distress requires alteration. I think the right of distress may be made very hard. I object to the secrecy with which distraints are levied. I think there ought to be something in the nature of an order of the court in the first instance. I quite agree that since I wrote in 1882 matters have rather improved in this respect, because now persons who levy a distress must be licensed by the county court. You can not take up a man in the street and let him levy a distress as you could before the law was altered. But I do not think that goes quite far enough; in many cases now the right inflicts a very serious hardship upon a tenant; and this does not apply to agricultural tenancies but to all tenancies. I have a case in my mind in which this happened: A farmer was in arrear with his rent at Christmas; he had agreed with the agent that on a certain day in the following February he would pay 300*l.* of those arrears; and he was making his arrangements accordingly to pay that on that day. Before that day arrived, the agent sent one of his under-strappers and made inquiries in the village where this man lived, and from the inquiries that he made he thought that the man intended, or seemed likely not to keep his engagement that he had made to pay his 300*l.*, and then and there, before the day arrived, he put a man in possession and distrained. The distress was actually levied. The tenant was away from home; he was met at the station by his son with tears in his eyes. The farmer was a respectable man, and I need not tell you that he was very much annoyed at this indignity being offered to him, and he went to the agent and told him so, and then he went to the agent's master and got the man in possession removed. The man was not removed until next day, and the cheque for the 300*l.* was paid at once. I think that was a very cruel case. It has done the tenant and his family an irreparable wrong. The tenant, I need hardly say, left the farm as soon as he could; he held the farm under six months' notice to quit on either side, and he gave his notice before the 25th of March and got out on the 29th of September. That was a case in which the six months' notice was advantageous.

20,071. (*Chairman.*) How would you remedy such a thing?—I speak in the presence of Mr. Elton, and perhaps other lawyers, but I think that some remedy might be effected by a procedure analogous, to Order 14; that is to say, if you have a specially endorsed writ, you get judgment on that order, except the defendant shows good cause to the contrary. I suggested before that you should get from a court of competent jurisdiction, the county court, if you please, an order that distress should be levied and that the order should go upon service of it upon the defendant as a matter of course unless within 48 hours or some shorter time, a short time it must be, otherwise the order is of no use, he shows good cause to the contrary.

20,072. The complaint was that the distress was levied without notice?—It was levied without notice, and I think that is an injustice to all tenants.

20,073. I presume that the reason for the law at present is that if the tenant had notice he would not leave his goods?—Yes.

20,074. But we are dealing not with land but with every kind of tenancy?—Yes.

20,075. And the question is whether it would be safe to amend the law so as to give rights in every case and time in which he might remove his furniture or his goods, that is the difficulty?—That is the difficulty, I have thought of that, and I think you might get over it by having when the writ was issued an *ex parte* injunction granted to prevent a tenant parting with his goods. You would, so to say, amalgamate the Chancery procdure of getting an ex parte injunction, and the Common Law procedure under Order 3, Rule 6, and Order XIV.

20,076. (*Mr. Elton.*) Which you used to get very quickly—in the morning if you thought the straw or corn was to be moved in the evening?—Yes, we can do that now promptly.

20,077. (*Viscount Cobham.*) There would not be much difference if your suggestion was carried out except that it would be less of an indignity?—There would be less publicity. Every man in the village knew that the tenant had the bailiffs in the house in the case I have mentioned. It is really a terrible thing; the man's credit is gone.

20,078. There would not be the same publicity in going to the court?—Not in going to the court. But the consequence to the man would be worse—he would be liable to be committed for contempt of court, and to be sent to jail, so that the alteration is no hardship upon the landlord, for the landlord would be in as good a position as now; but you would avoid such cruel usage as in this case.

Income tax.

20,079. We have had a good deal of evidence on rates and taxes, and unless you have anything special I do not think it is necessary to go into it?—I should like on that question of rates and taxes, to hand in the resolution which the Farmers' Club passed on the 30th April last and sent to the Chancellor of the Exchequer in reference to the Income Tax. There are two points on the Income Tax I wish to bring before the Commission.

20,080. Are they incorporated in these resolutions?—One of them is.

20,081. (*Chairman.*) Just read the resolution?—The resolution was, " This club respectfully submits to the " Chancellor of the Exchequer, that occupiers of " land in England should not be charged at a higher " rate of duty for Income Tax under Schedule B. than " occupiers of similar land in Scotland or Ireland."

20,082. That is another point?—That is one point I wish to draw attention to.

20,083. (*Viscount Cobham.*) What is the other point?—The other part of the resolution protests " against " the injustice of assessing the duties payable on the " succession to real estate on the capital value of such " estate, so long as personal property is exempted from " local rates." I think it my duty to hand that in. The other point on the Income Tax is that I do not think the allowance of 10 per cent. under Schedule A. is enough. I got my brief up before the Budget was announced, and that was one of the points I made and advocated.

20,084. (*Mr. Lambert.*) How much would you suggest?—I will give you the figures in my own case. I let a

Mr. S. B. L. Druce. 11 May 1894.

small farm at 255*l.* 10*s.* a year, and I pay Income Tax upon that amount and the tenant deducts it. I do not get anything like 255*l.* 10*s.* because I pay for land tax 11*l.* 9*s.* 1*d.*, and I have to pay a drainage rate, which is a landlord's charge, of 4*l.* 7*d.*; the property is held on two manors, part of it freehold and part of it copyhold, and the quit rent is 5*l.* 3*s.* 2*d.*

20,085. (*Chairman.*) Surely this would be deducted?—Never.

20,086. (*Mr. Everett.*) You are not required to pay Income Tax on what you pay away for land tax?—Is that so?

20,087. (*Mr. Little.*) Nor for drainage?—Well then there is a charity rentcharge, and the repairs are 18*l.*, that is on an average of three years, so that my receipts are 213*l.* instead of 255*l.*, and I think 10 per cent. does not cover that.

20,088. (*Chairman.*) According to the view of Mr. Little you are entitled to deduct the land tax; you are entitled to deduct these things—take the land tax first?—That is 11*l.* 9*s.* and 4*l.* for drainage, if that is so then what I say falls to the ground. I am much obliged to Mr. Little. I will in future deduct these items.

20,089. (*Mr. Little.*) Have you made the return or was the return made by the tenant?—The return was made by the tenant.

20,090. And if the tenant does not claim the landlord suffers?—Certainly.

20,091. But the landlord is not obliged to repay the tenant more than the proper amount that should be charged?—I know that that is so. In my house in London I suffer the other way.

20,092. And the assessment is made upon the return of the tenant?—The assessment is made upon the return of the tenant.

20,093. And does not come under your notice at all?—I know nothing about it.

20,094. Your remedy would be to deduct something from what the tenant has paid?—Certainly I could not do that from the tenant.

20,095. But still you have by law the right to do it?—So I understand.

20,096. (*Chairman.*) You can tell the tenant to make these deductions?—Yes, I suppose so.

20,097. (*Mr. Lambert.*) As to whether the 10 per cent. now proposed by the Chancellor of the Exchequer would cover that, I think you have shown that it does?—The figures show that.

20,098. (*Chairman.*) If you deduct these items it is quite clear that the 10 per cent. would cover it?—It would more than cover it in my case.

20,099. (*Viscount Cobham.*) For that particular year?—This is an average of three years.

20,100. Would that be the case in large estates?—No, I do not think so.

20,101. (*Captain Owen Thomas.*) That does not include new buildings or anything like that?—No, it does not include new buildings or interest on money that was spent in new buildings.

20,102. (*Chairman.*) That is in the nature of an investment?—Yes, it is in the nature of an investment; it does not include that. I spent 200*l.* or 150*l.* when the tenant went in six years ago. I have not taken this into consideration, but I do not think 10 per cent. would be enough in the case of large estates. Of course I employ no agent having only this little farm of my own; the tenant simply sends me the cheque and there is an end of the matter, and I go down myself and see for myself the gates and buildings, and have a chat with the tenant as to what is wanted on the farm.

20,103. (*Viscount Cobham.*) Was not it calculated even before the great fall in rents that the 10 per cent. of the gross income was required for the maintenance of buildings alone?—Certainly, that comes out in my figures; if you deduct the land tax, the drainage rate, the quit rent, and the rest is only repairs, it brings it very nearly to the 10 per cent.

20,104. (*Mr. Lambert.*) Ten per cent. would be 25*l.*, and in that case in that year it is only 18*l.*?—Quite so, but with regard to what Mr. Lambert asked me as to English farmers, I have tried to ascertain why the Scotch and Irish farmers only pay on one-third in Schedule B., and the English farmers pay the half of seven-eighths, and I cannot find any reason for it.

20,105-6. (*Mr. Clay.*) Is it not because the Scotch farmers have paid more rent than the English farmers?—I do not know whether that is the reason. *Mr. S. B. L. Druce.* 11 May 1894.

20,107. (*Chairman.*) There must be very few farmers even now with the reduction of rents who pay any Income Tax at all. Under the system of abatements at present the farmers pays on one half of the rent, and that must be 300*l.* before he pays anything. At present unless the rent is over 300*l.* the farmer pays no Income Tax at all?—That is true.

20,108. But beyond that there is an abatement up to 400*l.*?—Yes, now; and it is to be up to 500*l.*

20,109. Up to 500*l.* Therefore with a reduction of rent the number of farmers who pay Income Tax must be very few; and beyond that there must be a very large number who get considerable abatements?—No doubt there are a good many farmers with higher rents than that.

20,110. (*Viscount Cobham.*) Have you anything more to say upon that?—No.

Agricultural education.

20,111. As to agricultural education, do you think it might be extended?—I am very sorry that there is no representative on the new Secondary Education Commission of agricultural education at all, especially with reference to agricultural technical education by county councils.

20,112. You advocate farm schools?—I have advocated farm schools for a long time, but not school farms,

20,113. To teach labourers or farmers?—Farmers.

20,114. Maintained by the county councils?—Maintained by the county councils.

20,115. Would that be in lieu of the system of itinerant lecturers?—I do not think that there has been a fair trial of the practice of itinerate lecturers.

20,116. (*Chairman.*) What is the distinction between farm schools and school farms?—A school farm is where you attach a farm to an existing school such as an endowed grammar school. It has been said that there should be a farm attached to each of those schools at which boys should learn agriculture. I am against that. The farm school, on the other hand, is for boys who have left the ordinary school. There should be such a farm in each county with proper buildings where the boys may be received as boarders, and at which they should be educated practically on the farm and theoretically in the building.

20,117. (*Viscount Cobham.*) That would necessitate a combination of counties?—Yes, perhaps. The farm schools as I advocate them are very much like those in France.

20,118. It has been done in a few cases?—Yes, they have begun in Surrey and Sussex, and they are contemplating it in other counties.

20,119. There is one in Nottinghamshire?—I did not know that. I have given a good deal of attention to this subject and written a good many papers on agricultural education, and many years ago I was the first hon. secretary to the Committee of the Royal Agricultural Society of England when under the guidance of the late Mr. Holland and Sir Thomas Acland, the Society started the agricultural education. I think there is not sufficient done, and something like farm schools is required.

20,120. (*Chairman.*) What sized farms must they be?—That depends upon the circumstances of the locality, and the money that is available. You must not have too large a farm. The point that I advocate is that the boys on them should do practical work as well as receive theoretical instruction.

20,121. (*Viscount Cobham.*) At what age should they go?—After they have left school. My idea is to give the boy the ordinary general education of a board school or a better class of school.

20,122. At what age would you take them?—15 years of age.

20,123. (*Chairman.*) Supposing a county council or a combination of county councils take 200 acres, they would farm that and work it?—That is my idea. The size must depend upon the money available. There is nothing like taking an instance. I have practically worked at this through one of my sons. I gave him a good school education and he passed the Matriculation Examination at the University of London; then I sent him to Cirencester and kept him there the full term. He came out gold medallist, and was second at the

Mr. S. B. L. Druce. 11 May 1894.

Royal Agricultural Society's examination. He has taken up as his work in life the teaching of agricultural education. The Cheshire County Council started the idea which we are now talking about as an experiment last year. They had had a dairy institute for many years. Last autumn, not wanting it during the winter time, they took a dozen or 14 boys and boarded them, and taught them the practical work upon that farm for the six months between Michaelmas and Lady Day last, and these boys worked at the farm work, and were taught in the science connected with agriculture as well. My boy was in charge.

20,124. The Cheshire County Council had this farm not for this purpose but for other purposes as a kind of dairy farm?—No, as a dairy institute. It was started in Cheshire before the grant was given to the county councils. It was started by a limited company, and when the county council had the grant given to them the company turned over the farm to the county council. During the summer they have dairy classes continuously, one following upon the other, and during this last winter they have tried the experiment of using the farm and buildings as an agricultural college for boys.

20,125. The main object of the farm is a model farm, I suppose, to be an example to the neigbourhood?—Not a model to the neighbourhood at all, but as a teaching place.

20,126. Merely as a teaching place?—Merely as a teaching place.

20,127. (*Viscount Cobham.*) Not with a view of profit?—Not at all.

20,128. Does it pay its way?—I do not know. I think that something of the sort might well be done in other counties or districts.

20,129. But you are not disposed in favour of the practice of sending itinerant lecturers?—I do not think that practice has been fairly tried, because county councils have tried to combine two if not three things, which in my opinion are not capable of combination. They have tried to make these lectures such as boys can understand and educational to them; and they have also tried to make them instructing and amusing to grown-up farmers. It is impossible to combine those two things. It is not fair on any lecturer to ask him to attempt it. The instruction to a grown-up farmer is a totally different thing from the instruction required for boys and girls leaving or who have just left school. Some councils have tried to combine a third thing, namely, the instruction of the teachers and schoolmasters in the ordinary board and elementary schools. Those three things, the teaching of the children, the instruction of grown-up farmers, and the teaching of the teachers should all be kept perfectly distinct from each other. The consequence of the attempt to combine two of, and in some cases all those three things, has been that the lectures under the system pursued have not been a success, but I think that it deserves a longer and further trial, and if done on the lines I have indicated a greater success will attend it.

20,130. (*Chairman.*) In this case of the Cheshire farm, do they charge anything to the boys?—They give the boys what they call scholarships, which consist of sufficient to pay their expenses during the time that they are at the farm.

20,131. Are they from the class of farmers?—I believe so.

20,132. Not labourers?—Farmers I believe.

Freedom of sale and cropping.

20,133. (*Mr. Whitehead.*) Under the head of restrictions on cultivation and sale of produce you say that the tenant should be allowed to crop as he likes and sell what he likes under the obligation to keep and leave the land clean and in good condition. Would the landlord in that case be sufficiently protected, do you think?—I think he would.

20,134. There would be good tenants to whom that would apply well, but there would be bad tenants to whom that would not apply?—You must mind the words "keep and leave"; if he is not keeping the farm in good heart and condition he is liable to an action at once.

20,135. You think that the tenant should not return the equivalent of manure for the hay and straw that he sells?—I should be inclined not to insist on that on the whole.

20,136. Your idea would be to restrict a tenant as little as possible?—That is my idea.

Mr. S. B. L. Druce. 11 May 1894.

Scheduling the condition of farms.

20,137. Would not the system mentioned by Lord Cobham just now as recommended by former witnesses of having an assessment of the fertility of each field on the farm by a practical man at the commencement of a tenancy, and also at the end—would not that be useful in this case?—Certainly, most useful.

20,138. And would be practicable, in your opinion?—I think it would be practicable. Of course it would be a great change, but I think that it would be practicable.

Agricultural Holdings Act. Extension of section 34.

20,139. To go on to the question of the erection of glass-houses, &c., without the consent of the landlord, might not this happen, that if a tenant put up such expensive houses upon the property, and did not succeed at the end of the tenancy, the landlord would be obliged to pay him for those glass-houses if he could not succeed in getting a tenant to take them?—I think not, because according to my idea he should only be entitled for matters of that sort if they were applicable to the particular farm.

20,140. And therefore it would only apply to farms in a district near a town?—It would probably only apply to a farm near a town. My idea is that the tenant is not to be allowed for any fancy erections that he may make on a farm, but only such as improve a farm *quâ* farm.

20,141. It would only be for the growth of such things as tomatoes and cucumbers, for which things there is a demand and ready sale?—Yes.

20,142. How would you make a restriction in the case; how would you limit the locality?—One of the reasons which apparently influenced the mind of the learned judge in his decision in the case of Meux and Cobley, was that in the particular locality where that farm was situated, many other farms were being adapted to the same sort of cultivation, and the growth of the same sort of produce, and it might be said that the tenant was doing no more than cultivating according to the ordinary cultivation of the district.

20,143. And his neighbours were doing the same?—His neighbours were doing the same. In carrying out my plan you would have to take into consideration similar reasons.

The schedules under the Act. Hops.

20,144. Why do you leave out the planting of hops from the Schedule of Part 1. You recommended that the fruit bushes, &c., should be taken out of that, Part 1, and put into Part 3, but you omit hops, and hops are in the first part?—It escaped me; I have no particular knowledge of hop countries, but I see no reason why hops should not be put into Part 3. It seems to me to follow.

20,145. Exactly; they are not more expensive to initiate than orchards?—No.

20,146. And therefore you would have no objection to exclude them from that schedule?—Quite so.

Removal of fruit trees.

20,147. (*Chairman.*) Can a tenant remove fruit bushes on the termination of his tenancy?—No, unless he is a market gardener.

20,148. If he is a market gardener, can he?—Yes.

20,149. But not otherwise?—Not otherwise.

20,150. An ordinary farmer who owns ordinary currant bushes, can he remove those at the end of his tenancy?—No.

20,151. Nor claim compensation?—No.

20,152. Could he cut down the apple trees which he himself has planted?—No.

20,153. Could he be restrained by the landlord for cutting them down?—Yes.

20,154. (*Mr. Everett.*) So far as he does not disturb the soil he may?—I do not think that it is so.

20,155. (*Mr. Elton.*) Jessel decided that; he said you must not cut down the trees; it would be altering the nature of the inheritance?—Quite so.

20,156. (*Chairman.*) When you have planted the tree in the ordinary course of cultivation, can you cut it down?—It is part of the soil.

20,157. I am rather doubtful. Where the tenant has planted a tree I am disposed to think that he would be entitled to cut it down?—I do not think that he would.

20,158. Where trees have been planted before the tenancy, of course, that would be a different matter?—There would be no question there; but even if he

Mr. S. B. L. Druce

11 May 1894.

plants them himself they become part of the property of the landlord.

20,159. (*Mr. Whitehead.*) If a tenant plants fruit trees he cannot take them away?—Certainly not.

20,160. He must leave them for the landlord, they become the landlord's property?—Certainly.

20,161. It is very desirable to encourage the planting of orchards, of course. But might it not entail hardships upon the landlords if tenants plant expensive fruit trees on unsuitable land?—Undoubtedly.

20,162. You protect the landlord against that contingency?—My idea is to compensate the tenant if he improves the farm as a farm if he carries out any farming operation, planting or what not, in an improper way, it is not an improvement, and he would get no compensation for it; if he plants trees on a rocky or other unsuitable soil, he would get nothing.

20,163. Although a tenant were distinctly allowed to plant what he liked, that would be a matter for the referee or arbitrator to decide?—Yes.

20,164. Might not that taking away of the consent from the landlord prevent him from planting fruit trees, which landlords do in a great many cases; would not the landlord say, "If you have that right without consent, you can do as you like; I will not give you "fruit trees;" because, as a matter of fact, landlords find fruit trees for the tenant. Would that prevent the landlord doing so?—I do not quite see that it should detract from the landlord supplying those things, the fact that the tenant might plant fruit trees without the landlord's consent would detract from the landlord supplying them.

Agricultural education.

20,165. As to the difficulty of getting lecturers by county councils, have they difficulty in getting proper lecturers?—They have undoubtedly great difficulties.

20,166. That is because the men have not been trained to the work?—There is not a proper supply at present.

20,167. Do you propose by your farm school to educate lecturers up to the proper mark?—I do not think that my farm schools will quite be equal to educate lecturers to that kind of work. My farm school is intended for the children of the farmers in the district. For a man to be a lecturer he wants a great deal more than that: he ought to go to a recognised Agricultural College. And in that regard I think that Cirencester and Downton ought to be officially recognised; that the men from them who pass in honours, and hold their certificates or diplomas should have a certain preference, just as honours men at our Universities have for other educational appointments.

20,168. Do you know that a school of the kind you indicate has just been started in Kent?—I had that in my mind.

20,169. Is that the kind of school you would establish in those districts you speak of?—Yes.

20,170. With a staff of professors, and generally to give an effective education in agriculture?—Yes.

20,171. And a certain number of acres for experimental work?—I think you might add that. But you must keep the experimental part distinct from the rest: you must not mix them up at all.

20,172. That is to be done at the Kent College: a certain part for experiment, and a certain part for practical teaching?—I do not know the details of the College.

20,173. Are you acquainted at all with Swanley College, for the purpose of fruit and garden cultivation?—I have not been there.

20,174. You do not know that that is on the same line?—I know that it is somewhat on those lines, but it is entirely horticultural, I think.

Income tax.

20,175. (*Mr. Giffen.*) With regard to the tenant's income being taken when assessments are made under Schedule B, is that a good mode of assessing tenants on their profits?—No, I do not think it is theoretically a good mode.

20,176. You cannot possibly fix by an Act of Parliament what the proportion of the tenant's income to the rent is?—I think that mode is very convenient, but I do not see that it is good in the sense of being accurate.

20,177. The proportion must vary in different places, and must vary according to the capacity of the tenant, and must vary from time to time, must it not?—Undoubtedly; I think that it is only a rough and ready way of getting at the tenants' income.

20,178. Would not the effect of a very great change of rent during the last 10 years, or 15 years be, that the proportion of the tenants' income has been changed by that change of rent—take the country all over?—I am not quite sure whether that would be so.

Mr. S. B. L. Druce.

11 May 1894.

20,179. Take 10 years ago: a tenant paid a rent of 600*l.*, and now the rent is 300*l.*; would you say that the tenant's income bears the same proportion to the 300*l.* as to the 600*l.*?—That is a very difficult question.

20,180. Then it is not a good system, fixing by Act of Parliament a certain proportion of the rent as the mode of assessing the tenant's income?—I do not think that it is good as an accurate mode; I think that it is a very convenient one.

20,181. It saves a lot of trouble?—That is my idea about it.

20,182. And you are not aware of what the calculations were upon which the proportion of the Income Tax Acts in England and Scotland respectively were settled?—I could not find out. Partly with a view to my evidence before this Commission, and for other reasons, I took a great deal of trouble to find out the reason for the difference, but could not get at it. The difference, in the first instance, as you are aware, applied only to Scotland, because there was no income tax in Ireland—for 10 or 12 years—between 1842 and 1854; the income tax was not imposed in Ireland until 1853 or 1854. I looked through the books on income tax, and tried everywhere I could think of to find out why this difference was made between the Scotch and English farmers.

20,183. Have you tried to find out the reason why the proportion that exists for the English farmer was made?—I could not find out why it was.

20,184. I tried to find out that myself, and I could not find it out?—I thought I had not gone far enough; although I have given a great deal of time to it, and it is therefore satisfactory to find that others have failed too.

Law of distress.

20,185. Then with regard to the distress for rent, and the remedies that you suggest, I suppose you are thinking of England alone, and not of Scotland?—My remarks apply to England only.

20,186. In fact, in Scotland they have very much the system that you propose?—Very much. The law of hypothec—I have not looked into it lately; it was partly abolished in 1867, and entirely in 1880, if I remember aright.

20,187. But in any case in Scotland, whether distress or an execution for debt, or anything of the kind, it is all done under the supervision of the court?—I think so; I think that is one of the points in which the Scotch law, as in many other points, is superior to ours.

20,188. I should like to ask you a question with reference to my examination of Mr. Smith, which, I think, you listened to yesterday?—I did.

Market gambling.

20,189. I put to him a question as to whether he had any acquaintance with the history of legislation for the prevention of speculation or illegitimate dealings in business, and, as I understand you are acquainted with these matters, I should be very much obliged if you would tell us what the history has been with regard to forestalling, and things of that sort, whether it has been effective or not?—I can only give you the legal position of it. Practices tending to enhance the price of victuals and other merchandise were an offence at common law, and were known under the name of forestalling, which included regrating and engrossing. In addition to offences at common law they were also prohibited by various statutes, the earliest of which was passed in the 51st year of the reign of Henry III., down to the 12th year of George III. But in the 12th year of George III., all these Acts, and also the Scotch and Irish statutes, to a similar effect, were repealed. The preamble repealing the Act runs thus: "Whereas "it hath been found by experience that the restraints "laid by several statutes upon the dealing in corn, "meal, flour, cattle, and sundry other sorts of victuals, "by preventing a free trade in the said commodities, "have a tendency to discourage the growth, and to "enhance the price of the same; which statutes, if "put in execution, would bring a great distress upon "the inhabitants of many parts of this kingdom." It may be a convenience perhaps to you, and to the members of this Commission, to know that in that statute you will find all the earlier statutes from the first year of Henry III. enumerated, every one of them,

Mr. S. B. L. Druce.

11 May 1894.

and they are all repealed. But the offence at common law still remained, notwithstanding that repeal, and it was not until 1844 that the common law offence was repealed by the 7th and 8th Victoria, Chapter 24. A special section in the last mentioned Act, however, keeps on foot the offences of "knowingly and fraudulently spreading false rumours with intent to enhance "or decry the price of any goods or merchandise, and "preventing by force or threats any goods being "brought to a fair or market."

20,190. Legislature has deliberately enacted that there is to be the utmost freedom in the markets in dealing with produce of every kind?—Absolutely.

20,191. That there is to be no restraint?—No restraint at all.

20,192. And that is the result of a long experience upon the subject, that all those Acts which were passed at different times for imposing restrictions upon produce were found to be ineffective, or useless, or worse?—That is the conclusion to be deduced.

20,193. These Acts do not include other Acts of the Legislature which were directed against speculation more particularly?—No, they relate only to the supply of victuals, of corn, meal, and such like things.

20,194. Still the dealings aimed at by these Acts were undoubtedly a speculation of a kind?—Undoubtedly regrating and engrossing, or the buying up of a thing in order to sell it in detail, so to say, or to prevent the goods going into a free market were a sort of speculation.

20,195. Our legislative experience is entirely against any restrictions in dealing with produce?—Entirely.

The law of distress.

20,196. (*Mr. Clay.*) You said, in answer to Mr. Giffen, regarding the law of hypothec that we manage things better in Scotland than in England?—I fancy you do.

20,197. But regarding hypothec you know that it has been abolished comparatively in Scotland; why should not you follow out the same thing in England by the law of distraint?—Well, for the reasons I have said, I think that the law of distress does more good than harm.

20,198. But if hypothec is abolished in Scotland, and landlords have not felt the disadvantage of it, and the tenants, I suppose, are thriving as well, if not better than in England, why not abolish it in England; the same principle applies?—I am not sufficiently acquainted with the conditions of Scotch farming and Scotch tenancy to give a proper answer to that question; I can only speak for England.

20,199. You said in your evidence that the law of distraint in England gave the tenant more time to pay his rent?—I think so.

20,200. That the landlord gave him more credit?—Yes, I think if you abolish the law of distress you would have rents paid in advance, what we call fore-rents; and I am not sure that you have not a good many fore-rents in Scotland?

20,201. We have?—I am not at all clear in my mind that that is not a greater hardship upon a tenant than the existence of the right of distress.

20,202. But sometimes this law of back payments rather encourages the taking of more land by the tenant than he has capital for?—It may; I quite admit that it is possible.

20,203. Is it not generally so, as a rule?—Not as a rule, I do not think so.

20,204. I suppose you admit that rent is the interest of the landlord's capital in the land?—Do you say that rent is the interest of capital in land?

20,205. The rent is the interest of the landlord's capital invested in land?—Yes, I suppose it is; I do not think I can get over that.

20,206. The trader who supplies the farmer with different articles for the benefit of the farm in the shape of lime, cake, manure, and clover; seeds, &c., what position is he in?—The trader need not supply a single shillingsworth of goods until he has been paid for them.

20,207. And the landlord need not take the tenant without he has capital?—The tenant must pay in that case a fore-rent, and I say that is a great hardship upon him. Take a tenant going in at Michaelmas; a tenant going in at Michaelmas practically obtains nothing from the farm to pay the half year's rent due at Lady Day until the following Michaelmas.

Mr. S. B. L. Druce.

11 May 1894.

20,208. And as the trader advances his seeds and cakes and all those other things on credit, which is often done, does he get it back again as well as the landlord? Does not the trader who sells his articles to the tenant often have to wait 12 months and 18 months for his money?—But that is the distinction; he need not; there is nothing in the nature of the article that he supplies that compels him to do it. Now, as regards the land the nature of the article is such that the landlord must give it, that is to say, sell it *pro tanto* to the tenant at once, and the tenant can get no return from it for at least six months.

20,209. But how soon does the tenant get a return from the trader's outlay?—Soon.

20,210. How soon?—Very soon.

20,211. No sooner than the landlord?—Yes, supposing he fats bullocks for Christmas, and he does not put them in until November.

20,212. I did not mention a bullock or a sheep. I mentioned the article that he buys from the trader in the shape of lime, for instance?—He buys oil cake and he gets his return by the sale of the bullocks or sheep in six weeks.

20,213. And if he puts the lime into the farm, what then?—Of course he takes some time to get a return.

20,214. Do not you think that the landlord sometimes gets an extra per-centage of rent?—No, I do not think so.

20,215. Does not the man who buys on credit pay more for an article than a ready money buyer?—But the land is a limited quantity.

20,216. But the landlord puts the tenant there, he has the choice of the tenant, has he not?—A good many landlords would be glad to have the choice of tenants now.

20,217. I am speaking of ordinary times, this is an exceptional depression in England. I hope that it will pass away?—I hope so.

20,218. But the landlord has a right to enter into the tenant's capability as to the supply of capital?—Undoubtedly.

20,219. And why should not it act the same as in England?—It may be I have not seen much of it; but I cannot help thinking that it would be a very great hardship on a farmer going into a farm at Michaelmas that he should have to pay down at once the half year's rent due at Lady Day. Take a 500*l.* a year farm, he would have to pay 250*l.* and be out of that for all that time. I think that it is a far greater hardship upon him than the liability to the right of distress.

20,220. Is not it a far greater hardship upon a trader who risks not merely the interest of his money but his principal when the landlord is securing 20*s.* in the £ for himself?—The landlord has only one year.

20,221. Is not it one year and a half?—But it is not fair to compare the two things. The trader's business is a commercial speculation, and the other at the utmost is a mere interest of money. The man runs the risk and takes that into consideration in what he charges.

20,222. Is not farming a more commercial business than it was 50 years ago?—I do not think that it is more a commercial undertaking as regards the taking of farms between landlord and tenant than it was in other days.

20,223. You admit that the abolition of hypothec is good and yet you do not admit that this law should be abolished in England?—I did not admit that the abolition was good, but what I did say was good was that your Scotch procedure as regards notice and so on is better.

20,224. Would not you be inclined to bring the distraint down to six months as a compromise; would not that benefit the trader?—I think the trader can look after himself. I am looking at these things to-day entirely from the point of view of the farmer and landlord. I think the trader can well look after himself.

Freedom of sale and cropping.

20,225. So can the land agent. Regarding the tenant in the cultivation of his land I think you say you are willing to give him a free hand?—Yes.

20,226. To crop as he likes?—Yes.

Mr. S. B. L. Druce. 11 May 1894.

20,227. And to sell the produce of the farm as long as he keeps the land clean and in good condition?—That is quite right.

20,228. Is that your idea?—That is my idea.

Condition of farm at end of lease.

20,229. And you would entail upon the tenant to leave the farm at the end of the lease in a regular rotation?—I think that would be better than the mere obligation to leave it clean and in good heart and condition. But to leave it clean and in good heart and condition would be sufficient in my opinion.

20,230. But he might crop the land in such a way as to leave the incoming tenant at very great disadvantage in not entering into grass or fallow?—It would be preferable that he should leave it in the ordinary course of cultivation prevalent in the neighbourhood.

20,231. Both as to cultivation and regular rotation?—Quite so.

The Agricultural Holdings Act.

20,232. As to the Agricultural Holdings Act I must congratulate you upon that; undoubtedly you are uncommonly sound upon it?—I am very much obliged to you.

Claims and counter-claims.

20,233. You think that the counter-claim of the landlord has rather frightened the tenants more than anything?—I rather think so.

20,234. And you would like to see it abolished and simply have a claim upon the dilapidations and a claim for increased fertility?—Yes, I should say so.

20,235. Some person must set the Act in motion?—Certainly.

20,236. Would you make the tenant or the landlord do it?—Either.

20,237. You are satisfied that it is clear and district before your mind that the claims should be made on the same day?—If they can be, or as near as possible.

20,238. Is not one party handicapped if the other sees the claim before him?—Yes, but that is the case in other matters.

Official referees.

20,239. Referring to the special official referee, you see no difficulty in securing a strong man in each county, or a few strong men in each county to arbitrate or give decisions upon that important question of compensation for improvements as well as for dilapidations?—I see no difficulty.

20,240. How would you appoint the official referee, leave it to the parties or to the county council to name him and send the nomination to the Board of Agriculture to be approved by them?—I think so. Of course you could not expect the Board of Agriculture to have sufficient local knowledge in the first instance, so that you must have names submitted to them, and I suggest that the county councils should first nominate the referees because they would have the local knowledge, when the names had been sent up, it would be incumbent upon the Board of Agriculture to make inquiries and see whether the persons named were fit and proper, and if they were then the Board of Agriculture should give them its license or certificate. And all references or arbitrations should go to them in regular rotation like the official referees in the courts.

20,241. Would you draw these official referees chiefly from agricultural men who are thoroughly grounded in agriculture in all its departments?—Clearly so.

20,242. Those men would get thoroughly well-trained and become expert in deciding disputes upon this point, would not they?—That is my idea.

20,243. I think you said you would do away with the schedules?—I should prefer to do away with the schedules.

Agricultural education.

20,244. Then you touch upon a very important matter which is perhaps difficult to work, and that is the agricultural education?—It is very difficult indeed.

20,245. When you were mentioning the creation of farm schools, had you in your mind that that principle is being carried out beneficially in Canada?—Now that you mention it, Canada is a very good example of that.

20,246. You know that in their agricultural education in Canada and in some other schools they have land connected with the college or school, and the young go out and work in the fields, and they are paid in proportion to what they do?—I have read accounts of the Canadian schools, but I had in my mind the French schools chiefly.

Mr. S. B. L. Druce. 11 May 1894.

20,247. Cirencester College, where your son has come out with honours would be a little too expensive, would it not?—Clearly Cirencester is far too expensive.

20,248. So that your idea of that would be much on the same lines as the Canadian schools?—Yes; do not misunderstand me, I think Cirencester ought to remain as it is and be officially recognised, so to say, as a head college over all those others that I advocate.

20,249. I do not know how you are situated with regard to schoolmasters in England, but we in Scotland have parish schoolmasters who have been coming up to Kensington every year to take diplomas, and now they are getting expert in following out the scientific business of farming and the general working of it, and they impart this information to their pupils?—Certainly; and in the last two or three years we have advanced so far that agricultural education is a subject which is taught in our elementary schools and for the teaching of which they get a grant. We have improved so far. And at the present day in several counties with which I am familiar, the elementary schoolmasters are being taught in order that they may themselves teach agriculture and so get the grant.

20,250. Of course you will recognise the difficulties in the matter, I mean the one of money?—Of course money is the difficulty in the matter, I agree.

20,251. You talk about having 200 acres; do you not think as an experiment that a small farm of half that size would do?—When the Chairman said 200 acres I did not mean to commit myself to that sized farm. I think 50 acres would be enough to begin with. The smaller you begin a thing the more likely it is to succeed.

20,252. As much land in connexion with the college as would keep a pair of horses to do the general work, would that do?—Something of that sort.

20,253. (*Mr. Gilmour.*) Do I understand that this school farm would be the top of the technical education in the county?—Yes.

20,254. What would be the particular use of these schoolmasters acquiring knowledge that a good many of them now have? Would you propose that they should teach elementary agriculture in the ordinary school to the younger children before they leave that school?—Yes. I have advocated that for a long time; but it must be purely elementary; as I have put it on more than one occasion, I do not see why you should teach children about an elephant and a boa constrictor and not teach them about a cow and a pig. A boy in after life will not have to do with elephants and boa constrictors, but with horses, cows, and pigs. Let him be taught all about horses and cows and pigs in an elementary way at the school.

20,255. Of course it can be, but there would be few lads who could possibly attend farm schools such as you speak of?—Certainly, it would only be a few lads. Mind you, I would not have a long course at the farm schools; I should let it be a short course. In Cheshire, where my boy has been during the last year, one term ran from Michaelmas to Christmas, and another from Christmas to Lady Day.

20,256. Therefore those boys when there to really derive from it any benefit, must have had some education from these schoolmasters in the different classes?—They must have had some, but not very much.

20,257. Has there been great difficulty felt in carrying on those agricultural classes owing to the want of secondary education coming in between the time the boys have left school and their attending these technical classes?—Undoubtedly.

20,258. For the furtherance of this agricultural technical work they ought to be distributed, to a great extent, over the country?—I think so. That was one of the reasons why I complain that there is no one on the Secondary Education Commission who has really taken this subject up.

Condition of farm at end of lease.

20,259. With reference to that other question which Mr. Clay spoke about, I understand that you now consider that at the end of leases it would be much better to leave the farms in a certain rotation, and that that would be a great guide to the valuers?—I think so on the whole.

20,260. Would not it be rather a difficult thing to judge the condition of a farm at a Martinmas entry; if

Mr. S. B. L. Druce. 11 May 1894.

you had not some such rotation laid down?—I presume we agree, at any rate, in this that the inspection of the farm must be at the same time of the year at the beginning and end of the tenancy, in order that a proper valuation may be made.

20,261. But in a country where the entry is at Martinmas in November, the valuation generally comes on in a very bleak time of the year when it is difficult to tell the state of the land?—There is that difficulty. Still, I think you can tell pretty well, even in November, how the farm is left, what the cultivations are, and whether they are all right. Of course, Martinmas is a bad time, Michaelmas is better.

20,262. You have the crop put before you in a certain way, in the stack yard which would be a most practial guide?—You have that.

20,263. You mention in your statement that the tenant should keep and leave the land clean and in good condition?—Certainly.

20,264. Now that keeping seems to me to entail a continual overlooking of the farm which is, to a certain extent, objectionable?—It is; but it need not be made objectionable. I have heard people say that it is very objectionable; still I do not think it need be made so. On a good many estates I found when I was about the country in 1879 to 1882, that it was done especially on large estates. There are two ways of doing the thing. If the agent goes to the farmer and says, "I am going "to see how these things are," in an imperious sort of way, that is one thing; but if he comes in a friendly spirit and has a ride round with the tenant, and sees how things are going on, it need not be objectionable.

20,265. Your plan would entail something of that kind being done, would it not?—There must be something of that sort. But, mind you, the bulk of English farmers—I am sorry to say I do not know much about Scotch farmers. I wish I did—but as far as I know English farmers, as a rule, are honest men, and do not take farms for the purpose of running them out, or wrecking them; and it is as much to their interest to do a farm well as it is for the landlord's interest.

Land under settlement.

20,266. (*Mr. Little.*) You mentioned the Settled Land Act as having given the landlord more facilities for improving the land. Have you found any difficulty from it being necessary to create a trust where the settlement does not give the trustees the power to sell?—Do you mean this, that where there are no trustees with a power of sale application must be made to the court to appoint trustees?

20,267. Yes?—That is so; and the reason of that is this: that you must have some hand to receive the money; and if the testator, or settlor, has appointed two or more persons, and made them his trustees, and given them a power to sell, it may be presumed that he considered them fit and proper persons to receive the sale moneys; but where he has not done that, there is no person who is a fit and proper person to receive the sale moneys, and therefore you must go to the court to get such persons appointed.

20,268. And on small properties that might prevent the use of the Act?—No, it is a very cheap procedure, it is all done in chambers.

Condition of farm at end of lease.

20,269. On the subject that Mr. Gilmour was asking you about, you would have a condition to keep and leave the land clean. Would not the condition of leaving the land clean and in good condition imply that it should be in a condition that a tenant would go on with it?—Probably it might.

20,270. But in a yearly tenancy it would be impossible to bring the land round in particular rotation?—Certainly.

20,271. But there the landlord would be safeguarded by words to keep and leave the land in a good state?—Yes.

20,272. I do not know whether you would impose this by law, or leave people free, assuming there are contracts on that point?—I think that you should leave people free to make contracts. But my idea is that an Act should be passed which should imply this obligation in all agreements.

Freedom of sale and cropping.

20,273. But still you would not force the landlord and tenant into this position of the tenant growing what he pleases and selling what he pleases?—No, I should not enforce that.

Mr. S. B. L. Druce. 11 May 1894.

20,274. I think one of your arguments in favour of this greater freedom is that those restrictions are not effective?—No, they are not effective.

20,275. They do not make people farm well?—No.

20,276. And do not prevent them farming badly?—No.

20,277. They are not strictly adhered to at the present time?—Certainly not.

20,278. But they become the subject of a claim frequently when a tenancy ends?—That is so.

The Agricultural Holdings Act.

20,279. With regard to the Agricultural Holdings Act, I think your evidence is to the effect that there is a prejudice against putting the Act into operation?—I think so.

Claims.

20,280. And that principally on account of the counter-claim which is invited or provoked?—Partly on that account. I would not say principally, but I think on that account and on account of the technicalities surrounding the Act.

20,281. You desire to shorten the period of claim, but I think I understand you that you do not think a specific claim absolutely necessary?—No; I do not.

20,282. Not a claim in detail?—Not a notice; pardon me.

20,283. I mean a claim by notice?—Yes.

20,284. You do not think it necessary that a tenant who intends to claim should give his landlord notice of what he intends to claim for before the termination of the tenancy?—No.

20,285. In Lincolnshire no notice of the claim is given?—None at all.

20,286. Under the custom?—None, whatever.

20,287. I think you said that a great number of tenants made no claim. Do they get no compensation where they make no claim?—Well, I do not think that the tenants get much compensation now-a-days.

20,288. Where they are entitled to it?—Yes, they do.

20,289. I mean where they do not claim. Are you aware that in hundreds of cases arbitrations are made under the old customs?—Yes; lots of cases.

20,290. In disregard of the Act?—Yes.

20,291. And in contravention of the Act?—In contravention of the Act? certainly in disregard of it.

20,292. Is it not provided that the tenant cannot claim for certain things when the compensation is given under the Act?—Yes.

20,293. The valuations are going on every day under the old customs, notwithstanding that proviso?—Certainly.

20,294. And tenants prefer that system to the more complicated system of the Agricultural Holdings Act?—I think so.

Official referees.

20,295. You desire to see the procedure simplified; but I gather that all you propose is the appointment of a single referee?—A single referee.

20,296. Your idea is that an official referee should be the single referee under the Act?—Certainly.

20,297. And that there should be no choice by the parties as to the official referee from a particular list, but that they should be taken in rotation?—I think that the system of rotation would be the better plan. Of course, there is a great deal to be said for the other point, that is the choice of the parties; but I think on the whole official rotation would be the better plan.

20,298. Then you would have the county council name a certain number and the Board of Agriculture accept or reject?—Certainly.

20,299. That would be throwing on the Board of Agriculture a rather difficult task, would it not, to reject men who have the confidence of the county council?—That would depend a good deal in what form it was made. There might be a large number sent from which to choose, and then it would not be.

Law of distress.

20,300. (*Mr. Dalton.*) If the law of distress was abolished as regards farms I suppose it would have to be abolished also for houses and other property; or do you think you could draw a distinction?—It would be rather difficult to draw a distinction, the distinction that occurs to one on the spur of the moment is that the whole of the farm is used for the trade and business, and houses are used only for habitation. But then, again, that would not apply to

Mr. S. B. L. Druce.

11 May 1894.

the cases of warehouses, shops, and other places used for business purposes.

20,301. You think it would have to be universal?—I think it would have to be.

20,302. Then taking first the case of farms. What effect do you think it would have upon the rent? Do you think the rent would have to be paid beforehand?—I think the rent would have to be paid beforehand.

20,303. And that it would be a lower rent?—I do not know whether it would or not; theoretically it should be of course, but I am not quite sure whether it would have that effect.

20,304. In the case of houses the rent is usually paid quarterly?—Yes.

20,305. I suppose it would make very little change in the rent of houses?—I do not know.

20,306. What do you think would be the effect of the abolition of the law of distress in the case of houses?—I think in the case of small tenancies, it would make a very great difficulty.

20,307. The rent would have to be paid beforehand by small tenants?—Yes.

20,308. And to a small tenant it would be a great hardship to have to pay his rent before he got his wages?—I think so.

20,309. But in the bulk of large house properties it would probably make no difference whatever?—In the case of the ordinary house I do not know that it would.

20,310. Or large business premises?—No, the rent is such a very small proportion of the outgoings of a business.

20,311. It would probably have a very much larger effect in the case of a farm where the rent is not paid for a year after the man enters into occupancy, than it would have in the case of a quarterly tenancy?—I think it would.

20,312. You do not feel at all sure of the effect it would have upon the rent of the farm?—Not as regards the amount.

20,313. But you feel sure it would have to be paid beforehand?—I feel pretty confident upon that.

20,314. That would keep the farmer with a small capital from taking a farm?—I think it would.

20,315. Might it lead to the land going out of cultivation for want of capital?—That is putting rather an extreme view; it might.

20,316. It would tell more severely upon a small capitalist than it would upon a large one?—Yes, it would.

20,317. (*Mr. Lambert.*) About this question of law of distress; you said that the trader might get paid for his goods before delivery?—Yes.

20,318. Would not the tenant get his goods cheaper if he paid for them before delivery?—Yes, I think so.

20,319. Would the same law apply to the landlord?—No, I think not; as I tried to explain, and the different nature of the property that is dealt with—the land in the one case and the goods in the other makes a material difference.

20,320. Do you think it would affect the man with plenty of capital, the abolition of the law of distress?—It would not affect the man with plenty of capital very much—not directly.

20,321. Is it not desirable that men should have capital for farming?—Yes, in everything.

20,322. You said that the landlord would make it easy for the tenant. Is it not desirable for the two to come to a fair bargain, that the landlord and tenant should meet on equal terms, and that the landlord should not have this clutch upon the tenant in the form of arrears of rent?—But it is impossible for people to meet on quite equal terms. You would have to go to Utopia to get that.

20,323. I believe that the tendency of legislation is to endeavour to make people meet on equal terms?—It may be so.

20,324. But is it true that legislation is endeavouring to protect the weak against the strong—to put it in popular parlance?—Not in cases where people are competent to take care of themselves, who are *sui juris*—in the case of children it is different.

Mr. S. B. L. Druce.

11 May 1894.

20,325. But where a tenant is in arrears of rent he is not competent to bargain?—I thought you were putting the case of a farm under ordinary circumstances. Of course, if anyone gets into arrears, whether in arrear with his rent or with interest on his mortgage, or he gets into debt to anybody he is not on equal terms with his creditor. The poor unfortunate man who wants to get a coat and is in debt to his tailor—the fact of having a long bill to pay does not help him.

20,326. Is not it desirable that there should be no encouragement to such a state of things as to produce that?—Undoubtedly; but I do not think that the law of distress produces that.

20,327. It tends to allow the farmer to get into arrears of rent?—No, it tends to allow the landlord to give the tenant time, and it tends very much to allow the tenant to tide over a period of misfortune.

20,328. In your own experience, do you know of any cases where tenants have got into arrears of rent, and where they have been unable to wipe off those arrears?—Yes.

20,329. Within the last 10 years?—Yes.

20,330. Could you give us many instances?—I object to give names. But in the case to which I was alluding, where the law of distraint was exercised last spring, the tenant has paid up every sixpence, and when he went out the landlord, although they allowed every other tenant 20 per cent. remission, allowed this tenant nothing, He paid up in full.

20,331. You said that that honest man was irreparably injured?—He was irreparably injured in his character.

20,332. Is it not advisable to get any legislation that would do away with that irreparable harm?—I have suggested a plan by which the benefits of the right may be retained; but the method of enforcing it, which caused this, what I call, irreparable wrong, may be avoided.

Encumbered estates.

20,333. In your statement you say: "If the landowner is not heavily encumbered." Is it a fact that a great many landlords are heavily encumbered?—It is very difficult for me to state that as a fact, because I do not know.

20,334. Is it your opinion that a great many landlords are heavily encumbered?—In common parlance, as you put it, and so far as my experience goes, a great many are encumbered.

20,335. They are encumbered, and that does not allow them to do what they like with their own land?—I do not say that they are so heavily encumbered as that.

20,336. A good many of them are not improvers of their property, but mere rentchargers?—Then a man must be heavily encumbered.

20,337. But when heavily encumbered it tends to that?—Yes.

20,338. And for the better cultivation of land the less encumbrance the better?—The less heavily encumbered—of course, there is a margin of encumbrance—the mortgagees will take the first charge on the land, and if there is a good margin, they do not trouble further.

20,339. But it is desirable in the interest of good cultivation to discourage the heavily encumbering of land?—Of course.

Land under settlement.

20,340. You say a good tenant farmer is more secure on a settled estate than on an unsettled estate. You attach a great deal of importance to being secured?—Undoubtedly, we all want security, but I draw a distinction between security and fixity.

20,341. I do not read that you advocate fixity of tenure?—No, I do not.

20,342. Assuming that a tenant had taken a farm of 120*l.* a year rent, and had made it by his own improvements worth 150*l.* a year at the end of the tenancy; and if you are farming upon a yearly tenancy, and the landlord should say that he must pay the extra 30*l.* a year (which the tenant had himself obtained by his own enterprise), or he must quit the farm, would you give the tenant compensation for disturbance in that respect?—Not for disturbance, but for the enhanced value.

Compensation for disturbance.

20,343. You object to compensation for disturbance?—Yes.

Mr. S. B. L. Druce.
11 May 1894.

20,344. And you do not attach sufficient interest in the security as to give compensation for disturbance? No; I would not give compensation for disturbance.

20,345. And you would allow the landlord to disturb the tenant when he pleases as long as he pays the full value of his improvements upon the estate?—It should be left to the ordinary law of 12 months' notice.

20,346. I believe you advocate two years' notice?—Yes, I prefer two years' notice. I think that the best form of tenancy, after a lease.

Tenants and occupying owners.

20,347. Then you say that a tenant farmer is in a better position than an occupying owner. If a man is an occupying owner and has capital enough to farm his land, is not he in a better position than the tenant farmer?—If the man owns a farm and has sufficient capital, ownership is the best but in all these cases we must consider what the ordinary circumstances are, viz., that people have only a certain amount of capital, whether they are farmers, or what not. Supposing a man commences life with say 5,000*l.*, and goes into farming, it is better in my opinion for him to be a tenant and invest 5,000*l.* in the farming stock and the other things required on a farm than to spend part of that sum in land and only have the remainder for the farm.

20,348. If a farmer had 5,000*l.* of capital and paid for a farm 2,500*l.*, and he used the other 2,500*l.* to cultivate it, he would then be in a better position than the farmer with only 2,500*l.* to cultivate another man's farm which was worth to the other man 2,500*l.*?—Given the man with the 5,000*l.* he had better take a farm as a tenant and have his 5,000*l.* free to farm with than buy a farm with 2,500*l.* and have the other half for farming.

20,349. But you do not suggest that the owner can farm land better than a tenant?—I did not mean to suggest, if you put the question of capital entirely out of sight, that the owner is not in a preferable position; but I say the tenant is in a preferable position under ordinary circumstances.

Leases.

20,350. Why are leases not popular?—Because I think times have been so bad, that tenants do not like to be tied down.

20,351. They are afraid they are going to be charged too much rent?—They think if a rent is fixed now they cannot tell how they will be able to pay it 20 years hence.

20,352. But 20 years is rather a long term?—Take seven years.

20,353. That would be rather an argument for a court of appeal for a revision of rent?—No; I do not go in for a court of appeal for revision of rents. I do not like it at all. I like to put each man on a par. What I have said is a great reason for there being no leases, but it is a fact that before these bad times leases were not very much cared for. You will find, if you read this old report of mine, that in Lincolnshire and many other places farmers would not touch leases.

20,354. Because they had a custom of tenant right?—Yes.

Compensation for improvements.

20,355. You say in your report, that is, the report you presented to the Duke of Richmond's Commission, that any improvement made by a tenant whereby the letting value of the farm has increased, compensation should be paid to the tenant on the termination of the tenancy. Are you still of that opinion?—I am not quite sure as to the letting value, whether it ought not to be the whole value. I am not sure. I do not know whether it would not be better to leave out the word "letting."

20,356. I want to know whether you would estimate the compensation upon the outlay or upon the value to the holding?—Upon the value to the holding.

26,357. You think that would be a fair protection to the landlord?—Yes.

20,358. And if a man laid out money on a farm without the consent of the landlord he should be compensated at the end of the tenancy if that outlay added to the value of the farm?—Undoubtedly.

20,359. And you would not have the written consent of the landlord in that respect?—No.

Official referees.

20,360. You advocate the appointment of official referees, I think?—Yes, for this reason; that I want the person who determines the question of compensation to be as strong a man as possible; to be a man as well qualified as possible, and I want, if possible, to get rid of the class of valuers who have had no education, and very often no practice in that way. I want a really good class of man, and I do not know how you can get that in a better way than I suggest, and I also want it for the purpose of simplifying the procedure.

Mr. S. B. L. Druce.
11 May 1894.

Compulsory valuation.

20,361. Would you, or would you not, in the case of a claim up to 200*l.*, make it compulsory, at the option of one or the other, that the compensation should be estimated by one valuer, and should not be left to two valuers and then an umpire?—I would in every case.

20,362. You would make it compulsory?—Yes; I cannot see the good of the two or three men.

20,363. I quite agree; but I want to know your opinion?—That is my opinion.

Free sale of improvements.

20,364. And then you object to the free sale of improvements?—Yes.

20,365. But that only applies as far as putting them up by auction you mean; but you would give to the tenant the whole value of his improvements on the farm?—Certainly.

Changes in system of farming.

20,366. In your experience do you think that there are any other changes whereby farmers themselves can meet this depression in agriculture by adopting different modes of cultivation and producing different commodities?—No, I think not; speaking generally, that can only be done in very favoured localities.

20,367. Has your attention been drawn to the working of the Ground Game Act?—Not specially. I have read and heard people talk about it but I never made any inquiries. It was only passed a short time before my Report to the Duke of Richmond's Commission was written.

20,368. (*Captain Owen Thomas.*) I understand you are here to represent the Farmers' Club as well as yourself?—Certainly.

Tribunal for fixing rent.

20,369. I understood you to say in reply to Lord Cobham to-day, and you also referred to it in answer to Mr. Lambert, that you are not in favour of rents being fixed and registered by any outside authority?—No.

20,370. May I ask has this matter been discussed by the Farmers' Club, and is that their opinion?—Yes, we had several discussions on it in the days of the Farmers' Alliance, that is from 1880 to 1883 or 1884.

20,371. (*Mr. Lambert.*) Have you had discussions on it lately?—Yes, but not so frequently as then.

20,372. (*Captain Owen Thomas.*) You are of opinion that this matter ought to be settled between the landlord and tenant?—Certainly.

20,373. You say that the sitting tenant is in as good a position as to the re-adjustment of the rent as the landlord is to refuse him that re-adjustment?—Not quite; no.

20,374. Can you tell me how rents are generally fixed?—By "the higgling of the market"—supply and demand.

20,375. Not by the agents?—Ultimately the agents agree to the rent, of course; but the two parties agree.

Agents.

20,376. Is it not a fact that large estates in England and Wales are managed by solicitors and others who have no knowledge of the value of land?—I think that there are some such cases still left; but I think that practice has fallen into desuetude.

20,377. How can you expect tenants to be fairly treated if such men are agents?—You must not think that all solicitors are bad.

20,378. I have estates in my mind, and that is the reason I am asking this question. Of course, I should like to know how those tenants are to be fairly treated by their agents and landlords?—You mean where there is a land agent of that description?

20,379. Yes?—All I can say is that the tenants have it very much in their own power. They are in many parts of England masters of the situation. The landlords are only too glad to get tenants, and if the tenants only stand firm they are much more likely to succeed than the landlords.

Reduction of rent.

20,380. But you know very well there are tenants paying 10 to 20 per cent. more than the real actual value of their land, because they know very well it would be perfectly useless to apply to their agents who are really ignorant of the value of the land, and who would not sympathise with them. What are they to do?—Go to the landlords personally. My experience is that if a tenant goes to the landlord personally he very often overrides and overrules the agent. I have known a case in which a widow went to a duke

Mr. S. B. L. Druce.

11 May 1894.

right past his agent. She would go and see the duke, and the consequence was that she got her rent reduced and had a fresh lease granted her; I think the rent was reduced from 800*l.* to 600*l.*

20,381. But all landlords are not lords and dukes?—No, that is an extreme case. If a widow can go to a duke, an ordinary tenant can go to an ordinary landlord. That is *à fortiori* the case.

20,382. But I know of a very large landlord and his tenants have gone to him, and of course it is plain to everyone that these men are paying 20 to 25 per cent. more than the real value of the land. The man is perfectly ignorant, and he says, "That is the rent, and "you must pay it, and if you do not like to pay it you "may go." If these men go, and get no redress, what can they do afterwards?—Let them threaten to go.

20,383. They have done so?—Let them go. You may depend upon it that the landlord will not let them go; not in the present day.

Land courts.

20,384. Will you admit that there is a growing feeling in England in favour of land courts?—No.

20,385. You do not?—There may be in Wales, I do not say; it is a long time since I had anything to do with Wales.

Agents' salaries.

20,386. Do you know whether some agents' salaries are based upon the amount of rents received?—I do not know; it is a delicate matter to inquire of an agent how he is paid.

20,387. I do not think that it is?—I know that I should not like to ask the question.

20,388. I suppose you are aware of the great difference between the wholesale price and the retail price of farm produce?—Yes.

Price received by farmers.

20,389. I was going to ask you whether you think that the farmers get the fair proportion of what a consumer pays?—No. I have long thought that they do not.

20,390. Have you personally thought on this matter?—Yes; and we have fully discussed it at the Farmers' Club. We had a capital paper written on the subject by Mr. Jenkins, the late Secretary of the Royal Agricultural Society; and the issue of that was that a company was started for the sale of farm produce in London. It was a company that was extremely well backed up both by money and brains; and in that you will agree when I tell you that it included Mr. Burdett Coutts, Mr. Pell, Mr. Faunce De Laune, and Lord Wantage, and that the manager was a well-known gentleman whom you may perhaps have as a witness before you here. But with all the money and all the brains, and the care and trouble they took, they failed. My conclusion is that it is a more difficult matter to bring about than people who have not tried it think.

20,391. (*Viscount Cobham.*) Is there not a company in London now of a similar character that is doing very well?—I am not quite sure whether it is *bonâ fide*. There is a company under the name, "The Farmers' Produce Company." They advertise very much, but whether they are paying well or are *bonâ fide* I do not know. Just about the time that I am speaking of there was a number of other companies started under similar names, but when one came to inquire into them they were simply people who adopted those names. I remember another that had a shop in Tottenham Court Road for dairy produce, but they I believe also did not succeed.

Societies for protection of farmers.

20,392. (*Captain Owen Thomas.*) Do you not think it would be a good thing for societies to be formed so as to protect farmers when buying their manures?—But they can do that now, a number of those societies is in existence.

20,393. But as a rule they seem to come to grief?—In Lincolnshire they have a very flourishing one, and also on the Cotswolds; and there are others too. I think the farmers can do that themselves. There is the Yorkshire association of clubs which do that. There are a number of them, and they are capital institutions. There is nothing to prevent the farmers doing that, and it is an excellent thing that they should do it. If landlords could assist in the formation of such an association in a county or district it would be a very great advantage to their tenants.

20,394. Do you think that the land is very much crippled for want of capital?—Yes, I do.

20,395. I was going to ask you which, in your opinion, has suffered most, the landlords or tenants during the last 20 years. Who has lost most capital comparatively?—You mean rateably?

Mr. S. B. L. Druce.

11 May 1894.

20,396. Yes?—I do not know; it is a very difficult question to generalise upon.

State loans.

20,397. Do you think it would benefit agriculture if the State advanced money at a low rate of interest to facilitate improvements and such things?—I think so; but that may be done under Drainage Acts and the Lands Improvements Acts now.

20,398. But not by the State—that is by the companies?—Yes.

20,399. But you know what high interest they charge; the State would charge a much lower rate of interest than those companies?—Yes, I think it would be a good thing. But loans were made originally by the State, I believe, and then this other plan was adopted.

Encumbered estates.

20,400. Do you think there would be much demand for State loans if they could be got for reasonable interest, say 3 per cent.?—I think there would be.

20,401. (*Lord Rendel.*) I observe you say that if a landowner is not heavily encumbered it makes no difference from the agricultural standpoint whether his land is copyhold or freehold tenure. I presume you have taken into account the difference between a landlord holding on a fee and holding on a life interest only?—I do not think I entirely understand your question.

20,402. I wanted to ask you this question on that: whether you have taken into consideration the fact that encumbrances which would be very light upon the fee would be overwhelming on the life interest?—Of course the same amount of encumbrance secured by the fee would be much lighter in proportion than when the same encumbrance was secured by only a life estate. That is so. But I do not think I quite follow your question.

20,403. I think I may make myself a little clearer by asking another question. You have already stated that it is impossible to do otherwise than roughly estimate the extent to which landlords are at the present day encumbered?—Yes.

20,404. But you recognise the fact that they are encumbered?—Yes.

20,405. And the suggestion is that the present forms of land tenure and the existence of settled land to so large an extent do not materially injure the interest of agriculture, but you make exception for the case of estates heavily encumbered?—Yes.

20,406. My suggestion is this: Have you considered that an estate which would not be heavily encumbered if it were not held in fee might be very heavily encumbered if held in settlement?—The tenant for life would only pay the interest on the encumbrances.

20,407. The tenant for life if he raises money himself must secure by insurance?—Certainly.

20,408. Consequently a life tenant who was once encumbered very easily reaches the end of his resources?—Undoubtedly. I quite agree with you, we must use the expression heavily encumbered, that I have used, with regard to the estate that the owner has in the land. Of course, if he is the owner in fee he can raise much more money upon the estate, that is to say, more heavily encumber it, than if he is the owner of a life estate, because in the latter case he can only mortgage or encumber his life estate, and secure that, as you say, by insurance.

20,409. Then it is conceivable that this exception may be a very important one indeed that you yourself make—heavily encumbered may be a very important matter, and have a very wide effect?—You must take my words "heavily encumbered" with reference to the estate, or rather the interest that the person has in the land encumbered. I admit that whether in fee or tenant for life, if his interest is "heavily encumbered," and by heavily encumbered I mean encumbered to a very great extent, he is in a bad position; but until the encumbrance reaches that I do not think it matters, from an agricultural standpoint, whether he is owner in fee or whether he is tenant for life.

20,410. Except that the encumbrances being an element in the case, from your point of view, the life interest is very much unfavourable?—To the owner clearly, because he cannot raise so much money upon it.

20,411. And, therefore, to the agricultural interest?—Would that be so? I do not think so. He cannot raise

Mr. S. B. L. Druce.

11 May 1894.

so much money. But I qualify that by saying if the owner is not heavily encumbered.

20,412. Therefore he has not the power to treat in the administration of his land?—If the fee is heavily encumbered—if the fee is encumbered up to the margin—he is in a bad position from an agricultural point of view; if the tenancy for life is encumbered up to the margin, he is equally so. If neither the fee simple nor the tenancy for life is encumbered up to that margin he is not; therefore it makes no difference whether the owner is owner in fee or tenant for life.

20,413. And if the great bulk of the land is already held in life interest only then this exception that you make of encumbrances has a very wide area, and a very important significance?—Of course, if estates are widely settled it has a wide area. But I am afraid we are now at cross purposes.

20,414. You are so clear that I quite understand your point. You are dealing simply with the relative position of fee and life; and I am endeavouring to extend the importance of your exception to the life interest, and to make it apply to the unfavourable effect of a settlement upon the agricultural interest?—Yes; of course, the encumbrances. On settled estates, as a rule, are encumbrances upon the inheritance, that is, upon the fee, and the tenant for life keeps them down; and I must acquiesce in your view to this extent, that it may happen that the tenant for life of an estate where there are heavy charges for jointures, portions for younger children, and so on, may more readily and easily be in the position of what I have called "heavily encumbered," than the tenant in fee simple.

20,415. That is all that I wish to make out. I did not seek to reverse any opinion, but only to modify to some extent what you expressed so clearly?—Quite so.

20,416. (*Viscount Cobham.*) The successor of the limited owner would be less likely to be encumbered, would not he?—It is possible.
